LEWISHAM.—Plans passed by the B.C.: Sixty houses, Cranston Road Estate, for Messrs. Clout & Tysoe, Ltd.; 18 houses, Chedleigh Road, for Messrs. J. W. Heath & Sons; 105 houses, L.C.C. Downham Estate, for Mr. J. G. Stephenson; 5 houses, Polsted Road, for Messrs Middletons (Builders), Ltd.

LIVERPOOL.—The Woolton Picture House Co., Ltd., Rigby Buildings 21 Dale Street, Liverpool (secretary, Mr. W. J. L. Croft), are proposing to erect a new cinema on a site at Mason Street, Woolton, Liverpool. The plans are being prepared by Mr. L. A. G. Pritchard, A.R.I.B.A., architect, 57 Moorfields, Liverpool.

LLANTARNAM.—A deputation was recently received in London from the Llantarnam Council, who put before the M.H. details of housing and road schemes. The Ministry gave permission to the housing scheme to proceed, but intimated that the roads construction was a matter for the M.T.

LONDON.—At a recent meeting of the London County Council, the Finance Committee presented estimates for the ensuing year amounting to £9,877,565, of which sum £6,089,280 relates to housing.

LOUTH.—At a meeting of Louth T.C. the Housing Committee reported in favour of erecting 57 houses on the Newmarket site, each house to have three bedrooms, and that application be made to the Ministry for subsidy of £9 per annum for 40 years in respect of each house.

MAIDSTONE.—The following plans were passed: House at Milgate Estate, Thurnham, for Mr. Greig; cottage bungalow at Maidstone Road, Headcorn, for Mr. C. Crouch; bungalow at Kingswood, Ulcombe, for Miss A. J. Watts; addition to office and workshops and office at Broomfield, for Mr. V. Thomas; blacksmith's forge at the Street, Bredhurst, for Mrs. Smitherman; petrol filling stations at Sandling, for Messrs. Parkes Brothers; at Lenham, for Mr. R. Hutchinson; at Ashford Road, Boxley (and also 16 separate garages), for Mr. T. Cook; and at Upper Street, Leeds, for Mr. Cheeseman.

MANCHESTER.—The Commercial Estates, Ltd., 78 Mosley Street, Manchester, have acquired a site with frontages to Parr's Wood Road and Calterick Road, Didsbury, Manchester, where they propose to erect 7 shops and houses. No contracts have yet been placed. A similar scheme is in course of preparation for the erection of 16 shops and houses at Platt Lane, Rusholme, the drawings for which are now being prepared.

MANCHESTER.—The Midland Bank, Ltd., of London, have acquired premises at 35 Stockport Road, Ardwick, Manchester, where they propose to establish a branch bank. The plans have been prepared by Messrs. Taylor & Simister, architects and surveyors, 29 Queen Street, Oldham. The contract has been placed with Messrs. Finker & Young, Ltd., builders and contractors, Monsall Street, Miles Platting, Manchester.

MANCHESTER.—The Manchester Residential Property Co., King Street, Manchester, have acquired a site at Searisbrook Road, Rusholme, where they propose to erect a number of houses. The plans have been prepared by Messrs. J. H. Maybury & Son, architects and surveyors, 19 Chapel Walks, Manchester, which provide for the erection of 24 houses of brick construction of the semi-detached type. The contract has been placed with Mr.

A. Hollows, builder, 27 Elmsmere Road, Fog Lane, Didsbury.

MANCHESTER.—Messrs. E. Turner (Builders), Ltd., 284 Stretford Road, Hulme, Manchester, are proposing to erect 24 houses on the Austin Drive, Fog Lane, Didsbury. No sub-contracts have yet been placed.

MANCHESTER.—Mr. W. H. Snow, builder, 119 King Street, Stretford, has acquired a site at Sark Road, Copley Road, and Kensington Road, Chorlton-cum-Hardy, Manchester, where he proposes to erect 36 houses. Mr. Snow has also secured 2½ acres of land at Carrington Lane, Ashton-on-Mersey, Sale, Ches., where he proposes to erect a number of bungalows and detached houses.

MANCHESTER.—At a meeting of the Wesleyan Connexional Chapel Committee building schemes for the erection of new chapels, schools, etc., were passed. The following are the chief items: Hull (Queen's Road).—At Newland, a new chapel is to be built, to cost £16,266, with 1,000 sittings. Southwell (Notts).—At Thurgaton, a small chapel, to seat 66 persons, is to be built, to cost £1,082. An alteration scheme is to be carried out at Moulton, Spalding, to cost £223.

MARYLEBONE.—On vacant land adjoining Baker Street Railway Station, Marylebone, large stores, a restaurant, a public hall, and 200 flats are to be built.

NEWPORT (MON.).—The M.H. has approved an extension of the T.C.'s housing scheme by a further 100 houses. Mr. S. Dear proposes to erect 32 houses in Chepstow Road. The T.C. have provisionally agreed to the erection by Messrs. L. and H. Gibson, contractors, Clayton Street, of 20 houses on the Riverside Estate.

NEWPORT.—The Housing Committee is considering a scheme to develop a new housing site of 8½ acres in Cromwell Road, where it is proposed to build 114 houses.

NOTTINGHAM.—The Nottingham City Council recently approved two schemes to complete the industrial housing project at Wollaton Park. The first consists of 198 houses to be built within the city boundary, and the second of 116 outside the boundary. The total cost will be £142,438. Eighty subsidy houses are to be built on the Cardale Road site, at a cost of £31,380.

NOTTINGHAM.—It is stated that Sir Albert Ball has purchased on behalf of Albert Ball (Nottingham), Ltd., the Widmerpool Estate, near Nottingham, for approximately £100,000. The purchasers intend to develop the estate, which embraces the whole of the village of Widmerpool and the Stanton Golf Links. It includes also parts of the villages of Keyworth, Whysall, Stanton, and Hickling, having an area of about 3,810 acres.

PALMER'S GREEN.—The Underground Company has bought a site for a station at Arnos Grove, Palmer's Green. The reason for the purchase is the development which is about to be started on Arnos Grove Estate.

QUARRY BANK.—The U.D.C. have received the sanction of the M.H. and a loan of £32,300 for the erection of 75 houses.

"Modern Paints and Painting"

Mr. Bernard Cayley, F.I.B.D., recently delivered a lecture on "Modern Paints and Painting" to members of the Bristol Society of Architects at the Royal West of England Academy.

Referring to the increase in the demand for mixed paints of various sorts during the last few years, the lecturer said the most remarkable incident in the increase was in the case of genuine white lead. It appeared likely that the time was rapidly approaching when all painters would use their genuine white lead in ready-mixed form, or at least the bulk of it. Of course, he was not of the opinion that all, or even a large proportion, of the ready prepared paints sold were of first-class quality, but from the architect's point of view there were several tests of a practical character which could be carried out without involving any analytical tests. The more important of these could be summarised as follows: (a) Is the paint easy to put on by means of a brush? (b) Does it flow out well, and do brush marks disappear? (c) Has it good body or obliterating power? (d) Has it good spreading power? (e) Is the colour satisfactory for the particular work in hand? (f) Is it durable when exposed to the weather? (g) At the end of a reasonable period, is the condition of the paint suitable for repainting without much preparation other than a thorough cleaning? Speaking upon the new Lead Paint Act, which came into force on January 1 last, Mr. Cayley said in some quarters it was thought that there was a provision in the Act which prohibited the use of white paint altogether, but that was not so. The chief provisions were that it was not to be purchased or used in the form of powder, that it was not to be put on with a spray or interiors, and that dry scraping was strictly prohibited. The lecturer then dealt with the various styles on the purely decorative side of house painting and colour selection. Regarding the latter, he said a building could be made attractive and happy in its appearance provided that the colours chosen for its decoration were suitable for the particular use to which the various compartments were to be put. He suggested that disappointment caused by failure to obtain a certain shade of colour was most likely to occur when the selection of colours was not made in the actual position such colours were to occupy. He was afraid many people regarded all varnishes as being of a somewhat similar character. It might surprise them to learn that more than 100 different varieties were made, each having its particular use. He would reiterate the fact that it was in the selection of the particular varnish which was exactly suitable for the purpose intended that the secret success of varnish was assured. Speaking of the best method of painting iron and steel, the lecturer said it had been calculated that millions of pounds in value were wasted each year by the corrosion of iron. In America some years ago a series of exposure tests were made by an independent body, who found that the pigment superior to the rest was orange chromatic.

Welshpool Slum Clearance Scheme

Mr. T. Alwyn Lloyd, F.R.I.B.A., recently presided over a meeting of the Council of the Welsh Housing and Development Association, when questions of slum clearances at Welshpool and the preservation of rural Wales were discussed.

Mr. E. A. Charles, Newport, speaking of the Rural Workers Act of December, 1926, said the main purpose of this Act was to restore old cottages by the making of grants. Thus the Ministry of Health was for the first time evincing an interest in the amenities of villages. Local authorities had been told that they must do nothing to interfere with or destroy any part of the character of the old English villages, and the Welsh Association had been driving home this warning ever since its inception. This and other associations had at last made an impression on the Government department. One of the provisions of the Act was that no more than £100 was to be expended on one house, and that this sum might be advanced by local authorities by way of a loan.

Mr. Lloyd, in the course of his speech, said this step was a wise one, and would help in the preservation of property which would otherwise fall into a state of decay and ruin. It proved also that housing and its amenities was no party matter. The preservation of rural Wales was a vitally important question, and now that the industrial situation was improving it was the chance of Wales to embark upon a campaign of preservation similar to the one employed in England. It would be a scheme specially applicable to the Welsh Housing Association. Speaking on the question of slum clearances in Wales, the Chairman remarked that this scheme, under the 1925 Housing Act, was of particular interest to North and South Wales. Cardiff was practically free from what was called slum property, its development being far more recent than the majority of towns and cities in the Principality. Welshpool, Carnarvon, Llanelli, and other older places had their slum areas and conditions, and the need for the abolition of those spots which seriously marred architectural beauty was obvious. Old cottages, particularly in the Borough of Welshpool, had been built when there were no by-laws, and now that the Ministry of Health were alive to the fact that the importance and value of towns and cities would be enhanced by the improvement of the ancient sites and properties, the possibility of Wales rejuvenating its old villages was very hopeful.

The housing conditions in the slum areas of Welshpool, concluded the Chairman, were really appalling, and the Welsh Housing Commissioners were busying themselves with a slum-clearance scheme in Powell's Row, and 32 new houses were being built at Erw-Wen, to replace the property in Powell's Row. The rent of the new houses would be 5s. 6d. per week, excluding rates.

New Architectural Books

Messrs. Batsford's spring announcements include the following:— "Plastering: Plain and Decorative," a Practical Illustrated Treatise on the Craft, by William Miller, edited by G. P. Bankart. "The Architecture of Ancient Greece, Its Historic Development," by Professor W. B. Dinsmoor, architect, late of Columbia University and Athens. "The Architecture of Ancient Rome, Its Historic Development," by Thomas Ashby, D.Litt., F.S.A., late Director of the British School at Rome, both founded on Anderson and Spiers' "The Architecture of Greece and Rome," "The Architecture of the Renaissance in France," an historical review; Vol. 1, Early Renaissance, Vol. 2, The Three Louis and Empire; by W. H. Ward, M.A., F.R.I.B.A., edited by Sir John W. Simpson, M.A., P.P.R.I.B.A. "The Architecture of the Renaissance in Italy," a General View, by Wm. J. Anderson, A.R.I.B.A.; edited and enlarged by Arthur Stratton, F.S.A., F.R.I.B.A. "The Homes of Our Ancestors," an Account of American Colonial Houses, Decoration and Furniture, by R. T. S. Halsey and Elizabeth Tower. "The Acropolis of Athens," an Illustrated Architectural Account, by M. Schede; translated from the German by H. T. Price. "Bertram Grosvenor Goodhue, Architect and Master of Many Arts," illustrated from the artist's work and drawings, with text by Dr. R. Adams Cram, H. B. Alexander, G. E. Hale, and others.

Trade Notes

The business of The Lamplough Daylamp, Ltd., has now been amalgamated with Halsted Hanby & Co., Ltd., under the new style and title of Restlight, Ltd. (Lamplough Illuminating Products), 40 Norfolk Street, London, W.C.2. Telephone: Central 4302.

The General Electric Co., Ltd., announce that the address of their Sheffield branch is now "Magnet House," Fitzalan Square, Sheffield. Telephone No.: Sheffield 25101.

Messrs. Geerz Bros. & Ramsden, Ltd., 47 Friday Street, E.C.4, have changed their style and address to: Ramarae, Ltd., 157-8-9, Chandos House, Buckingham Gate, S.W.1.

In the High Court of Justice, Chancery Division, before Mr. Justice Romer, Messrs. Major & Co., Ltd., the manufacturers of Solignum Wood Preserving Stain, applied for an injunction restraining Mr. S. Atlas, builder's merchant, of Hackney, from selling as and for Solignum goods which were not of the plaintiff company's manufacture. For the defendant it was stated that he did not know that Solignum was a proprietary article, and that in selling what he did sell for Solignum he was acting in good faith. Counsel for the defendant raised the question of costs, and asked his lordship to exercise his discretion in view of the statement that the defendant had acted in ignorance. But the injunction was given with costs against the defendant.

Structural Engineering Scholarship

The Institution of Structural Engineers announces that particulars are now available of a third triennial scholarship, valued at £300. This scholarship, which will be known as the Brenforce Travelling Scholarship, is offered with the object of encouraging the æsthetic design and artistic development in England of concrete and reinforced concrete; and also of providing the opportunity of foreign travel with the great experience that this affords to structural engineers.

Trade Catalogues.

Thos. Ash & Co., Ltd., 10, 12 and 14 Berkley Street, Birmingham. An illustrated catalogue dealing with the "Ashanco" systems of ventilation. The importance of efficient ventilation has recently received official recognition in the 1926 Report of the Industrial Fatigue Research Board, in which they state that they are convinced that efficient ventilation of factories is not only essential to the workers therein, but that it is highly conducive to an increased and thereby more profitable production. They also add that wherever possible it is preferable to install natural ventilation schemes.

Pickerings, Ltd., Globe Elevator Works, Stockton-on-Tees. A fully illustrated catalogue dealing with the complete range of goods manufactured by this firm. This range comprises every type of lift in present use, passenger, goods and service lifts, both electric and hand operated, capable of raising, according to their purpose, loads varying from a few pounds up to 40 tons.

The Cozy Stove Co., Ltd., 42 Berners Street, Oxford Street, W.1. A book of installation plans showing different methods of fixing the various types of Cozy Stoves.

The Nautilus Fire Co., Ltd., 60 Oxford Street, London, W.1. A new illustrated booklet giving full particulars of the Nautilus Coke Boiler: a detailed list of sizes, dimensions, patterns and prices is given at the end.

The Plywood Development Association, 81 City Road, E.C.1. A booklet dealing with some of the uses of plywood in the home. This edition has been prepared in order to give information on the best grades of plywood for each class of work.

Preservation of Rural Beauty

The Bootle (Cumberland) Rural District Council recently supported a resolution from the Woodstock Rural District Council asking the Government to authorise local authorities to reject or refer back all plans for buildings which threatened the rural beauty of the countryside.

Greenock Infirmary Extension

At the 118th annual meeting of Greenock Royal Infirmary, Mr. D. S. Macpherson, who presided, referred to the proposed extension scheme, and stated that the directors aimed at raising a fund of £60,000.

The Hall Mark of Your Craftsmanship

IN pointing out the need of a distinctive finish to an installation, we would again emphasise that such finish should be typical of the efficiency and durability of the whole. It is in this latter connection that we would urge—where a two-way switch is used—the “Crabtree” meets the demand for real efficiency.

The fact that the rapidity of make and break in the “Crabtree” Two-way is equal, giving therefore Quick Break on BOTH SIDES, is a factor which ensures the utmost length of durable service, while the underslung movement is one of the most efficient switch actions ever developed.

A good installation demands quality in its “moving parts”—such sound quality as is provided by—

“Craftsmen in Electrical Switches.”

Meet the present-day need Hot Water—Open Fire—Simple Cooking

IDEAL DOMESTIC BOILERS

New types for use open or closed—quickly convertible. Give large unobstructed open fires.

PRICES FROM
£5 : 0 : 0

The increasing demand for these boilers is convincing evidence of their merit and popularity.

Higgs, Ltd.,

£22,360; Thomas & Edge, £21,967; Higgs & Hill, Ltd., £21,880; Nox, Ltd., £19,977.

LEICESTER.—The E.C. have made a contract with Messrs. Henry Herbert & Sons, Leicester, for the extension of the Colleges of Art and Technology, at a total of £39,648.

LEWISHAM.—For the adaptation, as a central school, of the infants' department of Dalmain Road School, Lewisham, W., and the rebuilding of the senior departments, respectively, and the supply of the necessary furniture: W. H. Gaze & Sons, Ltd., 23 High Street, Kingston-on-Thames, £23,656 (accepted); T. D. Leng, Deptford, £24,334; J. W. Ellingham, Ltd., Dartford, £24,539; J. Garrett & Son, Balham Hill, £24,560; F. & T. Thorne, Isle of Dogs, £25,173; Soole & Son, Ltd., Richmond, £25,196 18s. 5d.; H. Kent, Hither Green, £25,731; W. Akers & Co., Ltd., South Norwood, £25,777; Thomas & Edge, Woolwich, £25,924; J. Carnichael (Contractors), Ltd., Wandsworth, £26,442; J. Smith & Sons (Norwood), Ltd., South Norwood, £26,789; Rice & Son, Brixton, £26,803; Rowley Bros., Ltd., Tottenham, £26,833; G. Parker & Sons, Ltd., Peckham, £26,843; Galbraith Bros., Ltd., Camberwell, £26,950; J. Marsland & Sons, Ltd., South Molton Street, £27,500; W. Harbrow, Ltd., Rotherhithe, £27,586; G. E. Wallis & Sons, Ltd., Haymarket and Maidstone, £27,906.

MAIDSTONE.—Tenders were received for the 6 non-parlour type cottages at Taylor's Lane, Trottscliffe, as follows: Mr. R. J. Sheppard, Maidstone, £2,200; Messrs. Hyder & Sons, Shipbourne, £2,350; Messrs. W. H. Simmonds & Son, Wrotham, £2,370; Mr. W. G. Bright, Trottscliffe, £2,490; Messrs. Pickup & Earle, Maidstone, £2,593 10s.; Messrs. J. A. Davison & Son, West Malling, £2,630; Mr. Austen Pope, Rochester, £2,775; Mr. R. Langridge, Snodland, £2,800; and Messrs. Curtis & Caine, Borough Green, £2,939 9s. 6d. The tenders received for the 6 non-parlour bungalows and 4 non-parlour cottages at Church Road, Ightham, were: Messrs. W. H. Simmonds & Son, £3,855; Messrs. Hyder & Sons, £3,927; Mr. B. Goodale, Hildenborough, £3,956; Mr. Austen Pope, £4,460; and Messrs. Curtis & Caine, £4,647 1s. 2d. The committee had accepted the tender of Messrs. Hyder & Sons for the houses at Trottscliffe, and of Messrs. W. H. Simmonds & Sons for those at Ightham.

NANTWICH.—For the erection of 28 additional houses on the Wallfields site for the Nantwich U.D.C. Mr. P. H. Paton, Surveyor to the Council, Council Offices, 25 Baker Street, Nantwich. Peter McLachlan, Latchford Without, Warrington, £14,033 12s.

NUNEATON.—For the reconstruction of the refuse disposal plant at St. Mary's Road depot, for the T.C., Mr. R. C. Moon, Borough Engineer, Bigley, Mills & Co., Ltd., of Westminster, S.W.1, accepted at £11,421.

OSWESTRY.—The T.C. have accepted the tender of a Wrexham firm, at £11,960, for the erection of 26 houses on the Llwyn estate.

POOLE.—The contract for the erection of new Dorchester Grammar School, at a cost of nearly £20,000, has been given to Mr. Spiller, of Chard. Mr. Thomas Hardy will lay the foundation stone in the course of the next month or so, and it is hoped that the Prince of Wales will perform the opening ceremony when he visits Dorchester next year.

STAFFORD.—The Staffs E.C. have accepted the tender of A. H. Guest, Ltd., of Stourbridge, at £33,754, for the erection and completion of a new wing at King Edward VI Grammar School.

STIFFORD.—For the erection of 20 houses at Stifford, for the Orsett R.D.C., Messrs. Brown Bros., Tilbury, £9,368 5s. 2d.

TAUNTON.—The tender of Messrs. Taylor & Sons, Taunton, at £1,751 18s., for the erection of a maternity home in Canon Street was accepted; and it was decided to apply for sanction to borrow £1,775. Messrs. F. and E. Small's (Taunton) tender of £2,087 for the demolition of old buildings in the Council's yard, the erection of new buildings, and the provision of a weighbridge, was also accepted.

TORQUAY.—The Corporation Housing Committee have accepted the tender, £17,482, of Messrs. Seston & Guscott for the erection of 38 houses on the Windmill Hill Housing Estate.

WATFORD.—The T.C. have accepted the following tenders for the erection of houses at "Harebreaks": Mr. D. W. Beck, 32 houses, £13,496; Mr. H. King, 44 houses, £20,796; and Messrs. Moss & Son, 48 houses, £26,160.

WESTHAMPNETT.—For the erection of 8 houses at Walburton and 6 at Yapton, for the R.D.C., the tender of Mr. H. W. Seymour, Bognor, has been accepted, at £6,370.

WEST THURROCK.—For the erection of 30 houses at West Thurrock, for the Orsett R.D.C. Messrs. Pault Bros., Purfleet, £14,698 10s.

WREXHAM.—Tenders have been accepted by the R.D.C. for the erection of 78 houses, which will be built at Gwersyllt, Broughton and Ruabon.

WORCESTER.—For the erection of 119 houses on the Droitwich Road and Checketts Lane site and 4 houses on the Lechmere Crescent housing site, the T.C. have accepted the tenders of A. Brazier, Ltd., at £52,429.

YORK.—The Corporation have accepted the tender, £5,640, of Mr. W. Sawdon, of Bridlington, for the erection of 12 houses on the Tang Hall Estate.

OXFORD STREET.—Foundations, retaining walls, etc., for the steel frame which will support the Corner House Restaurant, to be erected by Messrs. J. Lyons & Co., Ltd., at the corner of Oxford Street and Tottenham Court Road, W.1, are now being constructed. The work is to be entirely—except for a few specialists' trades—carried out by the company's building staff, under the direction of the architect, Mr. Frederick J. Wills, F.R.I.B.A., 62 Oxford Street, W.1.

THE TRUSCON FLOOR

IN REINFORCED CONCRETE

A TRUSCON FLOOR loaded with 3 cwt. to the square foot.
Maximum deflection $\frac{1}{8}$ inch over 21 ft. 9 ins. span.

THE TRUSCON FLOOR FOR STRENGTH.

The Truscon floor is constructed of monolithic reinforced concrete which accounts for its extraordinary weight-carrying properties. A building carcass tied with Truscon floors will withstand the heavy loads which it is subjected to during construction.

Our illustration shows a test on a Truscon floor of 21 ft. 9 ins. span designed to carry a load of 2 cwt. per square foot. The test load is 3 cwt. per square foot or 50 per cent. overload. The maximum deflection recorded was only one-third of an inch.

Scottish News

Sir John Gilmour, Secretary of State for Scotland, speaking recently at the annual dinner of the London Galloway Association, held at the Holborn Restaurant, said there was nothing in connection with present-day questions that should receive greater support than the improvement of rural housing, and the Government, by means of recent legislation, had done a good deal towards that end. Sickness and disease in the great cities of this country was due to housing more than to anything else, and it had been a great measure of reproach to Scotland. But they had made progress. What they needed more than anything was goodwill. He was disappointed by the fact that they were faced with another dispute in that great industry, and that there was a stoppage of the building going on in Glasgow just at a period when they believed they were overcoming their difficulties.

Housing Progress

At a recent meeting of Glasgow Town Council—Mr. D. Mason, the Lord Provost, presiding—Dr. Forgan asked that, in view of the attention drawn to Glasgow's housing problem by the Secretary of State for Scotland, and of the Lord Provost's reference to the efforts of the Corporation to solve the problem, would the Lord Provost state (1) how far short of the estimated annual needs of the city (5,000 new houses every year for the next 20 years) had been the number of new houses completed in Glasgow during 1926, and what was the approximate number of new houses likely to be completed in the course of 1927.

The Lord Provost said he was informed by the Master of Works that during 1926 the Dean of Guild Court had granted linings for the erection of 7,831 houses. Of these houses, 318 were of two apartments,

4,989 of three apartments, 1,265 of four apartments, 158 of five apartments, and 101 of six apartments and upwards. The number of houses completed during 1926 was approximately 2,865, of which 1,948 were by the Housing Department and 917 houses by private enterprise. The number of linings for dwelling-houses granted in January and February of the current year was 12, representing 801 houses. It was, therefore, impossible at that stage to approximate the number of new houses likely to be completed in the course of the current year.

Professional Notes.

Mr. Stephen Wilkinson, of London, has been appointed county architect to the Lancashire County Council at a salary of £1,500 per annum out of 102 applicants. Mr. Wilkinson, who is 49 years of age, served his articles in Manchester, and subsequently held appointments in the Manchester City Surveyor's Department, the Borough Engineer's Office, Blackpool, the Borough Surveyor's Office, Northampton, and in the Public Works Department of the Eastern Bengal State Railway, Calcutta.

Mr. A. B. Russell Taylor has removed from 52 Baker Street, where he has practised as a quantity surveyor for several years, to new offices at 48 Baker Street, Portman Square, W.1.

The company owning the buildings, concert halls, gardens, etc., of Buxton Spa being unable to pay dividends or find further capital for the renovation of their property, the Buxton Corporation has promoted a Bill in Parliament to enable them to take over the undertaking as necessary for the welfare of the town. The purchase price is stated to be £29,550, and some £7,000 will require to be spent at once to put the buildings in good repair.

CURRENT MEASURED RATES.

[COPYRIGHT.]

These Prices apply to a New Building, costing from £1,000 upwards, in the London Area
They hold 10 per cent. in excess of the actual prime cost, without Establishment Charges.

PRELIMINARIES.

Allow for General Foreman, according to nature of contract, for duration of contract	From £5 10s. per week.
Allow for Workmen's Compensation and Public Health Acts over whole amount of general building contract	1%
Allow for insurance against fire, ditto	1%
Allow for water, ditto	1%
Allow for District Surveyor's Fees	
For a new building 400 square feet in area and two storeys high	45/-
Add for every additional 100 feet in area	3/9
Add for every additional storey in height	7/6
Add for inspection of fire exits, &c., under Amendment Act, 1905—the greater of these alternatives	1/6th of the above fees or £1 ls.
Allow for supervision of plastering	7/6
Allow for filling in trenches within three feet of a building	7/6
Allow for licences in respect of hoardings, &c., within the City of London, as Regulations	say £10
Ditto, for licences from Borough Councils	say £1
Allow for mess and material sheds, offices, &c.	from £50
Hoeing complete	Per Foot Run 5/-
Planked gangway with handrail complete	4/-
Proper gantry complete	40/-
Sleeper roadways	8/-
Needling, strutting or shoring, including all labours and use and waste in erection and removal	Per Foot Cube 5/-

DEMOLITION

Pull down brickwork	Per Ft. Super reduced quantities 6d.	In small quantities 2d.
Add, if in very small quantities not exceeding 21 ft.	3d.	
Add for filling baskets with debris and running same out to carts	1 1/2d.	1 1/2d.
Add if debris has to be raised or lowered to ground level	2d.	Usually dropped
Add for cartage when same costs 4/6 per 1 1/2 yard load	2 1/2d.	2 1/2d.
Clean and stack old bricks	20/- per thousand	
Hack off old plaster	1/- per sq. yd.	

EXCAVATOR, CONCRETOR AND DRAINS.

Excavate in common soil, wheel, fill carts and cart away	Per Yard Cube 9/6	5 ft. deep 11/-	5 ft. to 10 ft. deep 9d.
Planking and strutting	4d. per foot super.		
Planking, strutting and shoring	1/-		
Portland cement and ballast	1 to 6	1. 2. 4.	Holting
Concrete in foundations	29/6	36/6	2/6
Add if in ground floors	2/-	2/10	2/6
Add if in beams or lintels	3/-	4/-	2/6
Tested stoneware drains jointed in cement or standard iron drains jointed in lead, per foot run	2/-	3/-	3/- 4/6
Extra only for bends, each	2/6	3/6	11/6 20/-
Ditto, for junctions, each	3/-	4/3	19/- 35/-
Gullies, including concrete surround and iron grating, each	16/-	18/6	35/- 50/-

BRICKWORK (Exclusive of Pointing).

Built in 1 to 3 lime mortar	Per Rod Reduced 620/-	Flettons 830/-	Stocks 1060/-	Blues 1080/-
" " cement mortar	640/-	850/-		
Damp course	Per Foot Super 10d.	Horizontal 1/3	Vertical 1/-	
Two courses of slates in cement	9d.			
2-in. asphalt				
Facings	Per Foot Super Flemish bond 1 1/2d.	English bond 1 1/2d. plus 10%		
Allow for every 5s. additional cost of the facing bricks over the common brick basis				
Pointing (exclusive of scaffolding)				
Weather joint in cement				2 1/2d.
Flat joint in cement (struck) and lime whitening				1 1/2d.

ARCHES.

Extra over common brickwork	Per Ft. Super 1/-
In half-brick rings of bricks of same class as common brickwork	1/-
Add if of superior bricks for every 7/6 per thousand additional cost	1d.
In rubbed and gauged arches with fine joints	6/-
Quoins, angles, copings and sills of superior bricks	Per Ft. Run
Allow for every 5s. per thousand additional cost of bricks over the common basis price	1 1/2d. plus 10%
Double-tile creasing and cement fillets and pointing to 9-in. wall	1/2

PAVING.

	1 in.	1 1/2 in.	2 in.	2 1/2 in.
Cement and sand	3/-	3/5	3/10	4/8
Granolithic	4/2	4/9	5/3	6/4
Asphalt	7/-			4/8
Tarmac				6/6

MASON.

	Per Foot Cube	Templates	Thresholds	Sills
York stone and all labours and mortar in hoisting and fixing	12/6	16/6	22/6	
Artificial stone	9/-	8/-	11/-	
Portland stone and all labours of usual character				To Elevation generally 19/6
Bath stone ditto				10/6

SLATER AND TILER.

	Per Square	Counters	Ladies
Welsh slating laid to a 2 1/2-in. lap with two composition nails to each slate	80/-	72/-	
Add for every 1/2-in. additional lap	2/3	3/7	
Add for copper nails	2/3	3/4	

Best selected green Westmorland slates laid to a 3-in. lap, with copper nails	135/-
Asbestos slates laid to a 3-in. lap, with compo. nails	41/-
Asbestos corrugated roofing with galv. screws and limpet washers	60/-
Plain red roof tiling 4-in. gauge, each tile in every fourth course nailed with two galv. iron nails	70/-
Add for vertical work	2/6
Add for circular on face in elevation	25%
Add for circular on plan, according to radius	40%
Add for circular on face in elevation and also on plan according to radius	66 1/2%

Old Delabole slates fixed complete—

	Size	Medium Grey	Medium Green	Per square
24 x 12 in.	90/-	93/-	100/-	Ditto

16 x 10 in.	86/-	91/-	91/-	Ditto
14 x 8 in.	80/-	86/-	86/-	Ditto
Green Randoms No. 2		115/-	115/-	Ditto
Grey-Green Randoms		98/6	98/6	Ditto
Green Peggies 12 in. to 8 in. long		87/6	87/6	Ditto

Cuttings—Eaves	Per Foot Run Equal 1 foot super.
Ridge tiling	Equal 1/2 foot super. 1/10
Fixing soakers	9d. per dozen.

CARPENTER.

Flat boarded centering, per yard super	5/-
Centering to beams, per yard super	7/6
Centres to arches, per foot super	2/-

	Plates	Floor	Roofs	Trusses
Fir framed in carpenter's work per ft. cube	4/-	6/-	5/10	8/9
At per square	1 in.	1 in.	1 1/2 in.	
Deal close boarding	31/-	35/-	48/-	
Battening for slates	10/-	11/-	12/-	
Roofing felt lapped and laid	12/- to 20/-			

Gutter boards and bearers per foot super	1/-
--	-----

JOINER.

	Per square	1 in.	1 1/2 in.	2 in.
Deal plain-edged flooring	33/-	40/-	50/-	
Deal tongued and grooved flooring	37/-	45/-	56/-	
Deal matching	36/-	43/-	46/6	58/-

Sashes, per foot super	1 1/2 in.	2 in.
Deal moulded sashes, divided in squares	1/10	2/-

	Very small	Small	Normal	Large
Windows, per foot super				
Deal cased frames, 1-in. linings, 1 1/2-in. pulley styles, 2-in. sashes in squares, oak sill, double hung with pulleys, lines and weights	11/-	5/-	3/6	3/-

	2 in.	4 in.	6 in.	8 in.
Doors, per foot super	Panel 2/-	Panel 2/3	Panel 2/5	Panel 2/8
Square frame both sides doors	2 1/2d.	3 1/2d.	4d.	4 1/2d.
Add for each side moulded	4d.	4d.	4 1/2d.	5d.
Add for each side bead butt				

Doors of hardwood such as oak or mahogany, will cost three times as much exclusive of polishing.				
Staircase				
1 1/2-in. Deal tread, 1-in. riser, fixed complete per foot super				2/6
2-in. Deal strings, per foot super				2/-
Housing steps to strings, each				9d.

THE STRONGEST AGGREGATE

FROST will not disintegrate Betonac Steel Concrete. It is practically dustless and completely impervious to water. It is as durable as steel and is so graded that any type of surface from dead smooth to rough can be produced. Use it for roads, factories, subways, etc. Send a card for prices, samples and Report of National Physical Laboratory Report.

BETONAC STEEL CONCRETE

FRANCOIS CEMENTATION COMPANY, LTD
Betonac Department, 5 Bentley
Works, Doncaster.

THE MARK OF STABILITY
When it is possible to produce better cement than "Kaye's" Portland Cement, we shall be the first to make it. Are you using "Kaye's," one of the oldest British Portland Cements?

KAYE'S PORTLAND CEMENT

Builders requiring an efficient binding material which costs less than Portland Cement, we recommend "Kaye's" BLUE LIAS LIME, produced from the beds of the Lower Lias formation. Write to:—

KAYE & CO., LTD., Southam Works, nr. Rugby
Stocks: BIRMINGHAM, MANCHESTER, NOTTINGHAM, COVENTRY, LEICESTER, STOKE-ON-TRENT.

LAFARGE WHITE PORTLAND CEMENT

Façade in Lafarge White Cement.

Delivered ex London Stock by
THE ROM RIVER CO., LTD.,
7 WHARF, AMBERLEY ROAD, PADDINGTON, W.9
Telephone: PADDINGTON 2192

H & C WROUGHT STEEL VENTILATORS

YEARS of experience in the manufacture of Ventilators made from Wrought Steel have resulted in many and important improvements being effected, chief of which is increased capacity for the free transmission of air. We have reduced the area of fretwork obstruction and thereby largely increased the size of openings in our Ventilator faces, with added strength.

The air capacity of H. & C. faces will be supplied on request, together with sizes of Ventilators stocked. Made of heavy gauge steel to ensure rigidity and durability. Of all Ironmongers and Builders' Merchants.

Wm. E. PECK & CO. of London Inc.,
31, Bartholomew Close, LONDON, E.C.1

—Refinement—

English Facing Bricks and Hand- Made Roofing Tiles

are the only materials the texture and colour of which will give the Architect that air of refinement he seeks. No other materials, whether natural or artificial, allow those simple lines which make our fine old buildings the object of world-wide admiration.

Bricks and Tiles of every colour and shade and texture from Works in all parts of the country are now to be seen built up in the Showrooms of

W. T. LAMB & SONS,

BUILDING WAGE GRADES

Grade Classification	A	A1	A2	A3	B	B1	B2	B3	C	C1
Standard Rates	1/8	1/7½	1/7	1/6½	1/6	1/5½	1/5	1/4½	1/4	1/3½
Labourers' Rates	1/3½	1/2¾	1/2½	1/2	1/1¾	1/1½	1/1	1/0¾	1/0½	-/11½

The following are the gradings of towns in England and Wales. The rates quoted apply to all craftsmen, with the exception of those marked with an asterisk, which denotes that there is a differentiation in the rate paid to painters, details of which are given separately at foot. The London rates are:—Within a 12 mile radius from Charing Cross—all craftsmen (excluding painters), 1s. 9½d.; painters, 1s. 8½d.; labourers, 1s. 4½d. From 12 to 15 mile radius, all craftsmen (excluding painters), 1s. 9d.; painters, 1s. 8d.; labourers, 1s. 4d.

THIS IS AN ABRIDGED LIST; THE GRADINGS OF OTHER TOWNS MAY BE HAD ON APPLICATION TO THE EDITORIAL OFFICE OF THIS PAPER.

THE LURE OF THE TOWN

In a lecture to the London Society, Mr. Montague Fordham, well-known in agricultural circles, attributed the making of slums to the constant influx of country people into the towns. To London they come at the rate of 100 a week. London employers prefer these rosy-faced men to the sallow London born; and as, in the lecturer's opinion, the rural migrants do not take kindly to slums, they inevitably thrust the poorer and less capable cockneys down into the slums. Mr. Fordham's remedy is the decentralisation of industry and the encouragement of agriculture; and he thinks that electrical development will bring it about. In effect, he looks to a network of cables, carrying cheap power all over the land, as the basis for starting industrial centres of reasonable size wherever they liked, creating real garden cities. Presumably these new centres of industry would first take numbers out of the towns; then local agriculture would revive to supply the food wants of this new industrial population and that in turn would bring out more men to work on the land. This might bring agriculture more directly under the control of the producer and consumer, the two classes primarily interested in it, as Mr. Fordham devoutly hopes; it may kill the dominance of the dealer who, "under the paralysing gamble which distinguishes the existing system of production and marketing, always wins." We are afraid, however, that most economists will regard Mr. Fordham's proposals as little less rosy than the cheeks of his town immigrants. The crux of the trouble is the fact that the return for producing an essential, like food, is far below that obtained for producing luxuries; and the difference is more accentuated because food-production is a gamble not only with the market, but with the uncertainties of climate, or, as we are speaking of the British Isles, of weather. Until a better economic relation is obtained, we fear the countryman will continue to feel the lure of the town, for life in which his present system of education largely predisposes him.

The influx of countrymen could not drive townsmen into slums, however, unless the slums were already there; and Mr. Fordham's explanation of the "making" of slums is hardly convincing, even if you accept his dictum that "the townsman's mind is decadent." With the countryman, however, the

solution of the problem rests. He it is who "will reconstruct the countryside, and make it more attractive than the towns." Well, if that reconstruction takes the form of stringing cables all over the land, raising "new industrial centres wherever we like," and developing rural districts on the lines which the C.P.R.E. has been started to combat, then the two-and-a-half millions of slum dwellers, that Mr. Fordham hopes to see moved out of the towns, will certainly be spared any noticeable shock by their change of environment.

LONDON BRIDGES

The Government's acceptance of the Report of the Royal Commission on Cross-River Traffic in London, and its proposal to implement the recommendations of the Commission in regard to the rehabilitation of Waterloo Bridge, and other suggested bridges, has given much satisfaction; although most people would have welcomed a more decided attitude on the subject of the proposed bridge at Charing Cross. At the same time, the Cabinet had reasons for further examination of this scheme for which various wild estimates of cost, ranging from five to twenty million pounds, were advanced in evidence before the Commission. The larger estimates were probably based upon the supposition that the Southern Railway rights in the present bridge would have to be extinguished and the terminus of the line moved to the south side of the River. The Commission's recommendations do not alter the present access of the Railway to a station on the north bank. On the contrary, they substitute a new bridge for one that is admittedly deficient in strength; and one that has, moreover, only another twelve years of Parliamentary sanction to run. The railway will have, too, a brand new station, which may well be an improvement on the present one. We do not think, therefore, the question of a new Charing Cross Bridge need be clouded by fears of large claims for compensation which are hard to substantiate and would be resisted. Apart, however, from this particular matter, the question of a great and much needed public improvement is hardly to be regarded as justified if it can be done cheaply. The question is not whether we can afford to build Charing Cross

Bridge, but whether we can afford not to build it; and to that we think there can only be one answer. The disturbing feature of the Premier's announcement was the rejection of the Commission's recommendation to carry out the various works by means

of a loan raised on the security of the Road Fund. That the general financial policy of the country renders this impossible, seems to imply that the Road Fund is to become a new "hen roost" for Chancellors of the Exchequer.

Notes and Comments

The Palace of Westminster

The deputation of craftsmen who waited on the First Commissioner of Works last week to urge that the Houses of Parliament should be renovated in a radical manner by an entire refacing with a durable variety of stone, was a remarkable sign of the times. The plan which the deputation put before Lord Peel is much more comprehensive, and also much more expensive, than that comprised in the recent report of his Department. The deputation, which consisted of stonemasons, carvers and workers in all branches of the trade, seem to be of opinion that the Office of Works' proposals amount only to tinkering with the job. Whether the craftsmen's ideas are likely to be entertained, and the question of cost rather militates against them, one is glad to find that they are becoming articulate, and that they expressed their desire that the work should be carried out in a manner which they consider workmanlike and conforming to the dignity of the crafts.

The Scottish Building Dispute

The strike of building operatives in Scotland, which has now been in progress for over three weeks, appears to centre upon the refusal of the Scottish Contractors' Association, a non-federated body of employers, to come within the national negotiating machinery of the industry or to be bound by its agreements. The employers are prepared, it is stated, to join in a Scottish or local General Council, providing it is not subject to the National Joint Council. The immediate trouble, out of which the larger question above has emerged, is the notice given by the employers for a reduction in the wages of labourers to rates below those fixed by the operatives' agreement with the federated employers. The operatives' unions cannot concede to the non-federated employers' rates less than those agreed and ruling with the federated employers, and the dispute, being now one of principle on both sides, promises to be protracted. Negotiations, arranged by the Ministry of Labour, have broken down.

A Question for Quiet Meditation

It is not very easy to follow the dispute which has arisen in regard to the new building of Messrs. Swan and Edgar, Ltd., in Piccadilly Circus. The ground landlord, otherwise the Crown, insisted on the building being carried to the same height as the rest of the adjoining Quadrant buildings, but the London County Council forbids the use of the top floor unless it is sub-divided by a fire-resisting partition to minimise the fire risk, this floor being beyond the reach of the fire hydrant. The new Quadrant buildings are much higher than the old ones, but by no means abnormal as modern buildings go in London. It will surprise most people that this top floor is beyond the reach of the fire hydrant, though this obviously refers to the hydrant installation of the building itself, and not to the capacity of the London fire-engines. It is also difficult to conceive that the accommodation of this floor, which is really in the roof, is of such negligible value on this most expensive site that, but for the requirements of the ground landlord, it would

not have been built, and that its projected use as workrooms and offices really forbids the introduction of a fire-resisting partition between the parts allotted for these very dissimilar purposes.

Vulgar Variety

Mr. W. G. Newton has been commenting on the "Pains and Pleasures of Architecture" at Manchester in a lecture given under the auspices of the Extra-mural Department of the University. The "pleasures" were mainly set forth by views of seemingly modern houses and public buildings. Even on its basis of modern machine methods, these served to show that a good deal of fine modern craftsmanship existed. Remarking that "ancient civilisation had been destroyed by imported barbarians, but we bred our own," Mr. Newton proceeded to illustrate his contention by slides of some of those "desirable residences" which are spreading in ribbon development along all the roads that proceed out of our towns. Artistically, the speculative house is as bad as it ever was, even before the Land Act of 1909, which was said to have killed it. It is within our recollection that there was a good deal of rejoicing in the Press at the time over that aspect of Mr. Lloyd George's measure. The housing shortage has made authority turn once more to the speculative builder; how soon, we wonder, will an irritated public demand a radical improvement in his productions or rejoice at his suppression.

Motor Traffic

To test public opinion on the subject, the Government has embodied its ideas and proposals about the future control of motor traffic in a sort of draft Bill, to the details of which, however, it is in no way committed. This is, perhaps, a step towards the long-awaited new statute; but the continued delay at getting to grips with this question seems to irritate motorists and non-motorists alike. The difficulty is the speed limit, and no legislation is going to solve it. The present limit exasperates the careful and skilful motorist, and provides no effective check on the reckless and dangerous driver. The penalty of three months' imprisonment, or a fine of £50, coupled with loss of licence, for a first conviction of dangerous driving will not appear unduly severe to the relatives of a pedestrian who happens to have been killed thereby, and who, in consequence, may be reduced to penury. The real truth is that there is a large number of persons who, through defects of temperament and constitution, are utterly unfitted ever to drive a motor vehicle, and we can understand the difficulty of the Government in devising any kind of legislation that will solve that problem.

Very Hard!

Sir Harry Foster, M.P. in a letter to *The Times*, has drawn attention to the fact that Aberdeen imported in a single day recently 1,300 tons of foreign granite. He calls it "a grim joke." It will be grimmer still if that granite leaves the northern city as "Aberdeen."

ALGIERS. Sketch by E. B. O'RORKE.

THE ARCHITECTURE CLUB

Complimentary Dinner to the Royal Commission on Cross-River Traffic

The Architecture Club, on Tuesday last, gave a complimentary dinner at the Savoy Hotel to the Royal Commission on Cross-River Traffic in London, of whom the following members were present: The Rt. Hon. Viscount Lee of Fareham, P.C. (Chairman), Professor C. E. Inglis, O.B.E., M.Inst.C.E., Sir William Plender, Bart., G.B.E., Sir Lawrence Weaver, K.B.E., F.S.A., Hon. A.R.I.B.A., E. G. Howarth, Esq. (Secretary). Mr. J. C. Squire (President of the Club) presided.

The Chairman, in proposing "The Royal Commission on Cross-River Traffic in London," said two years ago or thereabouts they met in connection with Waterloo Bridge, which at that time appeared to be seriously in danger and likely to be pulled down at any moment. They got together, therefore, and pressed for the formation of a Royal Commission to consider not only the problem of Waterloo Bridge, but the problem of Cross-River Traffic from the æsthetic and utilitarian point of view. The Commission was appointed—a Commission of exceptionally "Solid Men." The Report of the Commission was not, however, yet carried; it was still on paper. Waterloo Bridge, however, still stood, though at one time the engineers of the L.C.C. suggested it could not last more than a month. The Report had already, in this brief period of time, got much further than most reports of Royal Commissions. What usually happened in this country was that Royal Commissions were appointed, laboured for years in taking authoritative evidence, and then produced a report which

was printed, commented on, then pigeon-holed and forgotten. The Report of the Commission, however, had been almost unique, for within a few months of its appearance the Prime Minister had mentioned it in the House of Commons. They were present that evening not to complain, but to congratulate themselves: it looked as if the almost impossible were going to happen, and that the recommendations of the Commission were going to be carried out. With two unavoidable exceptions, the whole of the Commission was present that night, and as Chairman he would congratulate them on a Report which not only paid attention to the past, but also the æsthetic development of London in the future.

In response, Lord Lee said he sometimes wondered whether the Royal Commission need have driven just as fast as it had; but in response to an urgent appeal from H.M. Government they had put aside all else and lived laborious days and produced a "record" by producing their report before December 1. They were surprised, however, that the Government should slumber for three months before giving an indication of their ideas about the Report. On the other hand, it was a good thing when responsible officials could not be accused of coming to a hasty decision. As a Commission they were reasonably gratified by the views of the Government announced a short while back, even if tinged with regret for their vagueness and compelled to regard "the visibility as bad." But so far as Central London was concerned, the Commission regarded the general statement of the

Government's policy as reasonably satisfactory and clear. Satisfactory, he hoped, not only to themselves, but to the great municipal authorities concerned. As regards Waterloo Bridge, the Government had certainly left nothing to be desired in their precision and preparedness to back financially the scheme proposed by the Commission. The pronouncement concerning Charing Cross Bridge was also gratifying to the Commission, and, he hoped, to the travelling public as well. They had no complaint with the Government that certain technical matters should be enquired into by a committee of engineers—it would have to be done in any case; and they hoped it would be proceeded with without undue delay and emulate the "record" of the Commission on Cross-River Traffic. With regard to Ludgate Hill Bridge, he was confident that the Bridge House Estates would do everything they could to accept the views of the Government with regard to this Bridge. He was convinced that the City Corporation and the L.C.C. were too public-spirited to be influenced in the faintest degree by *amour propre*, or lacking in sympathetic action to the plan formulated by the Commission and approved in principle by the Government. They could take it that the Commission was entirely innocent of any desire or intention to interfere or challenge in any way the prerogatives of those august civic bodies. Without preconceived ideas they had endeavoured to put forward a solution to the problem which the great civic bodies could not consider as a whole.

In a recent speech at the Mansion House by Mr. Gatti, he (Lord Lee) was inclined to think there was a tendency to suspect the Royal Commission of having in some way done something derogatory against the L.C.C. and the City Corporation. Mr. Gatti stated that their responsibilities were being taken from them and given to someone else, and had said civic matters should not be dealt with in that piece-meal manner. But how could these matters be dealt with in any other than a piece-meal fashion so long as there was no public body able to view the field as a whole. The Commission emphatically pleaded "Not Guilty" to any charge of prejudicing the rights and privileges of the L.C.C.

Speaking of the Western Exodus problems, Lord Lee said he was glad that the Minister of Transport was to engage in conversations with local authorities to see how the work could be carried out and financed by the Road Fund. They must have accommodation in the streets: there was no time to lose. Further, he considered that even the Government hardly realised the magnitude of the impending congestion in their London streets. They had only one-fifth or one-sixth the number of motor vehicles they had in America. In two or three or four or five years it was quite possible that the amount of traffic might be at least doubled or trebled. There was no room at present for the mass of vehicles. The Government would enhance their reputation and their popularity and make the public feel they were doing something constructive if they adopted the proposals for improving traffic facilities with a little more open-hearted approval. As to finance, there was room for difference of opinion, but the money of the Road Fund should be available for road users, and should be devoted to the objects for which it was originally intended. When it was complained that under the scheme London would be getting more than its share, he would say that London contributed over £4,000,000 a year. It was only proposed that £1,000,000 of the Fund should be set aside for London.

In conclusion, "The More they Pulled together, the Bridgeier they would Be."

Professor Patrick Abercrombie, proposing "The Guests," congratulated the Commission on the unanimity of their Report. With regard to Charing Cross Bridge, doubt had been expressed as to a double-

decker, but he considered it a perfectly feasible problem for architectural solution, and there should be no difficulty in a satisfactory and great work of art in the construction of a double-decker bridge. It would be an opportunity for a great National Competition to produce a design equal to Waterloo Bridge. Speaking from the town-planning point of view, Professor Abercrombie said they simply could not afford to count the cost—except from the point of view of eventually saving money. Hausmann, in Paris, spent money to save money.

Mr. J. M. Gatti (Chairman of the L.C.C.), in response, said the Chairman had revealed himself as an optimist: the Report of the Bridges Commission met all their demands and requirements. The last speaker maintained also that their efforts to maintain Waterloo Bridge had been successful. If leaving two arches at each end and rebuilding in some other form was to their satisfaction, he had nothing more to say. The Chairman had stated his gratification with regard to the solution put forward with regard to Waterloo Bridge. He (Mr. Gatti) must mention, however, that when the L.C.C. had the same scheme under consideration they had been met with an howl of execration.

With reference to his speech at the Mansion House, Mr. Gatti said he was thoroughly prepared to defend it, because possibly the extract reported had been misinterpreted by Lord Lee and others. But even from the extract they would see he made it clear that the distinction he drew between the work of the Royal Commission, and the necessity for its formation which deplored, was because, with the necessity of surveying the problem as a whole, the two bodies that might have done so did not come together; therefore it was necessary to form the Bridges Commission. Lord Lee was no more responsible for its inception than himself. He was given a job and did it: as Chairman of the L.C.C. he would state that he was the last man to complain of the way it had been done. His only complaint was with the Proposer of the Toast who had taken Lord Lee to task for sticking to his instructions. The Commission had entirely to do with its terms of reference and, fortunately, had not gone beyond those terms. There had been a great deal of optimism expressed as to the way the Report had been received; and he could assure them that if the Report was not carried out, if it failed, it would not be because of any obstruction on the part of the L.C.C. They were willing to examine and re-examine the problem with a view to finding a solution: the final answer was with those responsible for the appointment of the Commission; it was for them to say whether they would take it as a whole or not. The desire of the L.C.C. was to use every effort to make their great City more worthy of itself.

Those who looked at the matter from the artistic standard should not, however, think the L.C.C. were inimical to those considerations—far from it. They appreciated that Art was a great civilising influence, but did not believe Art was separated from the other functions they had to perform: they must not "blame them for not taking as great an interest as they should in Art until they took an equivalent interest in Drains." Both sides might attach more weight to one argument than another, but they must not disassociate from the ideal of taking an interest and pride in their City.

Among those present were:

Prince George of Russia, Sir Reginald Blomfield, Mr. and Mrs. W. R. Davidge, Sir William Davison, M.P., Mr. and Mrs. N. G. Gedye, Mr. J. Frederick Green, Mr. and Mrs. Arthur Keen, Mr. and Mrs. D. S. MacColl, Mr. and Mrs. William Muirhead, Mr. J. R. Pakeman, Mr. and Mrs. Frank Pick, and Mr. J. S. Wilson.

MURAL DECORATION FROM THE DINING ROOM FOR PROFESSOR REILLY, LIVERPOOL. By MARY ADSHEAD.

MODERN DECORATIVE PAINTING

By MARY ADSHEAD.

Being an epitome of a paper read before the Liverpool Architectural Society.

What is a decorative painting? Broadly speaking, it is a painting which possesses qualities in accordance with the architectural decoration of a building and which completes that decoration. But the term is too often applied only to paintings executed *in situ*, or designed especially to fill wall spaces, and although it is about such paintings that I shall mostly talk, I should like to mention that many so-called "easel paintings" may become decorative paintings should they be placed with discrimination in surroundings where they fall in with the general scheme of decoration.

I am inclined to think that two qualities are always present in pictures which have a decorative value—simplicity and convention—the more sophisticated the technique, or the more realistic the style of a painting, the further it is from being decorative.

All early schools of painting executed nothing but wall decoration, and these two qualities of simplicity and convention are always present in their work. It is usually with the decline of a big artistic movement that realism supervenes and the painting becomes less decorative. Mural painting is being greatly encouraged at the moment both in England and in France, and there are endless opportunities for the use of it.

In public buildings, such as theatres, town halls, libraries and churches, there is now, as ever, plenty of opportunity, and we also have cinemas and dance halls, though in the latter case I think the opportunities offered have been rather neglected.

Perhaps the most important work being done at the moment is the decoration of St. Stephen's Hall, Westminster, by past students of the Rome School. This school of extremely capable painters represents the more academic side of mural painting, and includes some artists of repute, such as Mr. Colin Gill, Mr.

A. K. Laurence and Mr. T. Monnington. Mr. Laurence is also decorating Newcastle Town Hall.

But it is not to the municipalities that the mural painter looks for patronage to-day so much as to the private individual, business firms, hotel and restaurant proprietors, shipping companies, and, above all, to the smaller and more individual shop owners. Art is more and more centring round commerce.

Mr. Pick, of the London Underground—whose reputation for encouraging all that is best in poster decoration is well known—has just tried a rather interesting experiment at the Bank Station. Being before all else a business man, he naturally wanted his decorations to pay, so he insisted on their serving as advertisements at the same time; therefore a compromise was made between "Art" and "Commerce," and I executed for him three large panels advertising the "wears" of two well-known firms.

These firms, I believe, had to pay pretty heavily for the advertisement, but whether they received any advantage from the enterprise, or whether the decorations lost anything by their commercial interest, is matter for speculation.

Great encouragement has been given to students in Art Schools of recent years to revive decorative painting, and at the Slade School—with the help of Sir Joseph Duveen and others—experiments have been made which show that it is not necessarily a very expensive business to have wall decorations carried out on quite a large scale by young painters whose reputations are still in the making; so that anyone prepared to take the risk may, without incurring too great an expense, acquire a modern and original mural painting.

In house decoration there is an increasing interest in pictures as pieces of decoration. It is only recently that this has come about. During the last century,

DECORATIVE DETAIL, SHADWELL MEMORIAL HALL. By REX WHISTLER.

pictures used to be just pictures, to be hitched up anywhere, and to be looked at solely with regard to their intrinsic value. One had to keep one's eyes inside the confines of the frame, regardless of what surrounded it.

Now, however, we are coming to feel that the picture is such a vital part of the decoration of a room that it must be considered with it as a whole; it must complete the decoration of the room.

Even in the Academy, I am told, there is an uneasy feeling awakening as to the probable doom of the purely "easel picture."

As I said before, almost any kind of picture can be made decorative by the skill with which it is placed in a proper setting; certainly no picture which possesses any decorative quality can look its best until it is rightly placed, hence the failure of many paintings in public galleries.

The tendency is, in the moderate-sized house, to concentrate rather on one important painting in a living-room usually placed over the mantelpiece than to have several of equal interest. This, I think, is the right treatment.

The question of whether a living-room should have painted walls or not is a difficult one, and depends largely upon the temperament of the inmates of the house. I think that certain quiet treatments are possible, such as an all-over landscape giving the effect of tapestried walls, in front of which furniture may be placed; or a delicate floral and architectural design, such as is sometimes seen in 18th century wallpapers; but in most cases a few well arranged panels are most suitable.

A living-room should never be decorated in such a way that the walls force themselves unduly upon the consciousness of its inmates. For although one does in time cease to notice even the most startling of decorations, it must always be remembered that their effect is ruthless upon newcomers.

Yet there are places in almost every house where experimental paintings need not interfere with one's mood, such as halls, ante-rooms, passages, and especially the dining-room. This being a room which is only used intermittently, it can afford to have a decorative treatment of a more impressionable character; in fact, it can bear a certain amount of dramatic effect, as one is not in it long enough to come under the spell of its influence; the furniture, too, need not interrupt the design on the walls.

If people would only absorb this happy idea about dining-rooms, what a lot of interesting experiments might be made! You have an example in this town where Professor Reilly has had the courage to submit his dining-room to the mercies of a decorative painter.

I think the same rule should apply to bedrooms as to living-rooms. The wall decoration, if any, should be unobtrusive, and rather give way to the furniture: but I have always felt that the ideal decoration for a bedroom is a painted ceiling. A Boucher ceiling must have been an exquisite scene to gaze upon during the waking hours.

I had nearly forgotten that most important centre for decoration—the nursery. There many delightful treatments are possible. Children, above all, appreciate anything really decorative.

As regards methods of application, I think I may say that in nine cases out of ten mural painters work on canvas in oil colours, tempered with wax to give a matt surface, and then malfage the canvas to the wall with white lead, thus forming a durable and satisfactory surface; or in some cases the canvas can be neatly tacked to the wall, which allows for removal if necessary; or, again, in cases where a large panel is used, the canvas is generally left upon the stretcher, and fixed to the wall with a wooden slip.

Frescoe is very seldom used in England as it is so unsuitable for the climate, and the preparation of the wall is costly. Tempera paint is sometimes used where a very flat, dry surface is wanted, but this is very difficult to clean, and is not proof against damp.

There is one point I should like to emphasise with regard to the position the mural painter finds himself in: he cannot very easily get into touch with the public, not being able to exhibit his work unless it take the form of small decorative panels; though, indeed, it is not so much the public in general whom he wishes to interest in his work, but rather the architects. It is through them that mural painting should be brought into use and introduced to the public.

It is the architects who should know how best to place paintings, and should advise their clients in adopting them; they should work in closer alliance with the painter in the redecoration of interiors and the designing of new ones.

But, before this satisfactory alliance can come about, the architects must be brought into touch with the painters.

THE DINING ROOM FOR PROFESSOR REILLY, LIVERPOOL. Decorated by MARY ADSHEAD.

I hope you will forgive my mentioning that I find many architects almost wholly ignorant of what the younger mural decorators are doing, and it is this ignorance, I believe, which provides the greatest barrier to the more general use of decorative painting in modern buildings.

I have so often heard architects say, in reply to my questions, "Well, the only painters we can rely on are so expensive we cannot employ them, and it is so difficult to know what we shall get if we employ someone we do not know well—the risk is too great." But I ask you—how can you ever hope to do anything original if you don't take a few risks?

It is not a matter to be taken so seriously, for should you not be permanently satisfied with some experiment you may have tried, it need not cost you so much that you cannot afford to throw it over for another at a later date; whether you liked it or not, you will have had something of interest, which is surely better than indulging in a policy of "Safety," which creates nothing! It is the timidity of architects that the mural painter is up against.

Professional Societies

Royal Institute of British Architects

We have received a copy of the R.I.B.A. Prizes and Studentships Pamphlet for 1927-1928. The pamphlet contains full information upon the various Prizes and Studentships, together with, where applicable, the detailed programmes for the competitions. Additional copies of the pamphlet are obtainable at the R.I.B.A., price 1s. exclusive of postage.

The following is the list of the dates of the R.I.B.A. examinations for 1927.

INTERMEDIATE EXAMINATION.—May 20, 21, 23, 24 and 26, 1927 (last day for receiving applications,

April 20); November 11, 12, 14, 15 and 17, 1927 (last day for receiving applications, October 18).

FINAL EXAMINATION.—July 6, 7, 8, 9, 11, 12, 13 and 14, 1927 (last day for receiving applications, June 3); December 7, 8, 9, 10, 12, 13, 14 and 15, 1927 (last day for receiving applications, November 7).

SPECIAL EXAMINATION.—July 6, 7, 8, 9, 11 and 12, 1927 (last day for receiving applications, June 3); December 7, 8, 9, 10, 12 and 13, 1927 (last day for receiving applications, November 7).

SPECIAL EXAMINATION IN DESIGN FOR FORMER MEMBERS OF THE SOCIETY OF ARCHITECTS.—July 6, 7, 8, 9 and 11, 1927 (last day for receiving applications, June 3); December 7, 8, 9, 10 and 12, 1927 (last day for receiving applications, November 7).

SPECIAL EXAMINATION OF LICENTIATES TO QUALIFY AS FELLOWS.—November 28, 29, 30, December 1 and 2, 1927 (last day for receiving applications, October 31).

STATUTORY EXAMINATION.—October 19, 20 and 21, 1927 (last day for receiving applications, October 3).

REGISTRATION AS PROBATIONER R.I.B.A.—Attention is called to the fact that the Council of the R.I.B.A. has decided that after December 31, 1928, no one shall be registered as a Probationer unless that person has passed one of the recognised public examinations in the required subjects. A list of the examinations recognised may be obtained free at the R.I.B.A.

Registration of Architects

The Registration Committee of the R.I.B.A., with the approval of the Council, has opened a voluntary register of persons who, *not* being members of the R.I.B.A. or of any of its allied societies, desire to have their registration qualifications recorded in view of the intention of the R.I.B.A. to promote a Bill for the Registration of Architects.

THE RUSSELL INSTITUTE, PAISLEY

This handsome building, which was opened by H.R.H. Princess Mary on March 19, bears the mark of several very modern architectural influences. Within the limits of its own style the building is well composed, especial care having been taken that the advantages of the corner site should be fully exploited. The architect, Mr. J. Steel Maitland, has placed a highly imposing feature over his entrance porch, but it may be suggested that this grand arched window slightly overbears the lateral façades, which have so much narrower openings. There can be no doubt, however, that, taken by itself, the central feature with its solid bastion-like effect is a fine conception and adequately expresses the institutional character of the building. Unfortunately, at a time when shops and offices are tending to usurp the special architectural emblems which should by right belong to structures of greater social consequence than themselves it is ever becoming more and more difficult to give to a public building the importance which is its due. It may be of interest to compare this building with another, also belonging to an institution, which happens to be placed on a site having points of resemblance to the one we are here considering. At the corner of Tottenham Court Road, the Central Y.M.C.A. occupies a corresponding position with one of its corners visting with the street opposite, and here again the designers very properly decided that the whole architectural emphasis of the building should be concentrated at this corner, which was surmounted by a large stone cupola. This is a highly successful treatment, for the cupola is especially displayed at the end of the street, while it suitably differentiates the building from the neighbouring shops. At Paisley, however, the architects in one respect have gone one better than the Y.M.C.A., inasmuch as, instead of placing the entrance of their building at the side, as was done in the former case, they have put it at the corner. From the architectural point of view this is a great improvement, because now the building has a higher degree of unity, combining its important entrance front in the grand central feature of its composition. In the Y.M.C.A. there were, no doubt, adequate reasons why the main entrance should be placed on one of the sides of the building rather than beneath the cupola, but here, whatever the difficulties of planning may have been, they have been successfully overcome. It is somewhat remarkable how few buildings occupying a corner site have had their entrances at the corner. The great "Port of London" building is perhaps the most important exception, and Whiteley's em-

porium in Queens Road also occurs to one in this connection. The architect of the Russell Institute is to be congratulated upon having seized the opportunity of providing a most interesting addition to the too meagre list of striking corner treatments of buildings. The treatment of the entrance here represented in a separate illustration is a particularly happy one, for by giving this portico a normal scale and emphatically bringing it forward in contrast with the tall façade behind it, the architect has done much to correct the excessive scale of the façade. If one asks in what respect this general scale is excessive, the answer must necessarily be that wherever the windows belonging to two or more storeys are grouped

together in a single enclosure without the divisions between the storeys being marked by horizontal bands of wallage of the same material, tone, and colour as the rest of the façade, the designer can scarcely be acquitted of the intention to suggest that his building contains chambers of a height comparable to the combined window opening. If in a Gothic ecclesiastical building, as at King's College, Cambridge, for instance, we see a window about 30 feet high, we know this truthfully represents the fact that the hall of worship inside has at least this dimension, measured from floor to ceiling. In the case of the corner façade of the Russell Institute, it may, of course, be remarked that in the pattern of the single great window opening there are horizontal divisions which actually correspond with the floor levels; but this fact is not expressed with sufficient emphasis and candour for us to be convinced that it was the intention of the architect to state it un-

THE RUSSELL INSTITUTE, PAISLEY: DETAIL OF ENTRANCE.

J. STEEL MAITLAND, Architect.

equivocally. On the contrary, we are left with the impression that he desired at least to hint to us that the Russell Institute differed from the surrounding buildings in possessing an enormous hall about 30 feet high. Even on the flanks a similar pretence is kept up, and we see on the left-hand side of the illustration a row of four apertures bounded in stone which undoubtedly give the impression that the first storey of the building is 20 feet high; for when this façade is seen obliquely, the band of dark material which marks the floor level between the first and second storeys is invisible, and it was obviously intended to be invisible. What is known as the vertical "emphasis," so much favoured by the modernists, is apt to involve a breach of scale. The Russell Institute, however, although being open to criticism from this point of view, is a building of architectural merit. The ornament is clever and extremely well placed.

THE RUSSELL INSTITUTE, PAISLEY. J. STEEL MAITLAND, Architect.

Edinburgh Architectural Association

The results of competitions promoted by the Edinburgh Architectural Association during the past session were recently intimated at the annual meeting of that body as follows: Design for a canopied drawwell in a formal garden (open to apprentices within three years of the commencement of their apprenticeship)—First prize, T. Dorrance; 2, D. W. Robertson. Design for a small dance hall (open to members within five years of the commencement of their apprenticeship)—1, R. C. Hutchinson; 2, M. Nicolson. Quick time study (design for a small house to cost £2,000), open to all members—1, R. C. Hutchinson; 2, J. W. Laing; 3, W. Kininmonth. Measured drawings executed during past session (open to all members)—Prize and silver medal, R. H. Matthew.

Aberdeen Society of Architects

At the 29th Annual General Meeting of the Aberdeen Society of Architects, Mr. Clement George was appointed President, and the other members of Council for the ensuing year were elected as follows: Past president, Mr. J. B. Nicol; vice-president, Mr. W. L. Duncan; ordinary members, Messrs. A. B. Gardner, W. E. Gauld, D. S. M'Millan, J. R. M'Millan, R. L. Rollo, and George Watt, together with a representative to be appointed from the Associates' Committee. Mr. W. E. Levie, advocate, was re-appointed as secretary and treasurer. This Society is the Aberdeen Chapter of the Incorporation of Architects in Scotland, and Mr. J. B. Nicol, the Past President of the Society, was elected to represent the Society on the Council of the Incorporation.

THE ARCHITECTURAL ASSOCIATION

Mr. Gilbert H. Jenkins on "Garden Design"

Mr. J. Alan Slater, M.A., F.R.I.B.A. (President), occupied the chair at a meeting of the Architectural Association, held at 35 Bedford Square, W.C.2, on Monday evening. After the minutes of the previous meeting had been confirmed, it was announced that there were seven nominations for membership, and the following new members were elected: Mr. T. M. Daniel, Mr. E. G. Stevens, Mr. R. H. Whistler, Miss M. Maitland, Miss I. M. L. Boon, Mr. M. Rowell, and Mr. S. Davidson.

Mr. Jenkins then read his paper on "Garden Design," and after a preliminary review from the historical aspect, said:

In a good example of the modern garden of pre-war days attention seems to have been focussed on giving the house a good setting and providing for it some interesting views, with beautiful flowers in well-planned beds as a foreground, a well-kept lawn occupying the middle distance, all more or less formally designed, and having a considerable amount of architectural detail to set them off.

Since the war it has been necessary to reduce the cost of upkeep, and this must have an influence upon design. The area of mown grass must be lessened (though the motor mower has gone far to solve the labour problem here); flower beds must be planted in such a way that it will be unnecessary to fill them with bedding plants raised laboriously from seed and planted out twice a year. Beds of flowering shrubs are replacing flower beds, and those who wish to minimise their labour bill will not start a large rock garden stocked with rare alpine. Again, the vogue of lawn tennis has resulted in a desire that the court should be possible for play the year round, and many varieties of hard court have been evolved. These, with their enclosing nets, are all ugly, and therefore the tennis court no longer occupies the lawn, but is tucked away in a corner and planted out with shrubs. The end planting should be a solid wall of green to enable the flight of the ball to be accurately judged, and the axis of the court decided by the time when it is to be used. If in the morning the long axis will be east to west, but for the afternoon and evening north to south.

Lately, at the Chelsea Shows, we have all seen specimens of so-called rock gardens, consisting of weather-worn boulders and rocks laboriously collected from remote corners of England or Wales, and more or less skilfully disposed in miniature hillocks with an electrically pumped streamlet and wee patches of rock plants inserted in the crannies or growing in the grass. No doubt a rock garden, cleverly arranged and well stocked, gives its possessor a great deal of pleasure, but it seems unnatural to find this kind of thing attempted hundreds of miles from its native place, and when the stones have been put in position by the average amateur the result is deplorable. Would it not be better to design a garden which is really at home in the district in which it is placed, and not to endeavour to do something which at best can only look like a piece of stage scenery without the footlights. Many an architect is too apt to overlook the lovely local materials available in the district in which he has to erect a house, and, similarly, it seems a pity to design a garden in the South of England all the structure of which has to be brought from Westmorland or Yorkshire.

The artistic arrangement of a rock garden seems one of the most difficult forms of garden design. That at Kew Gardens is a complete failure, if judged by the general effect: the scale of both lay-out and detail is too small. At Wisley, on the other hand, there

is a very fine piece of rock garden design, the general composition on the steep hillside, the arrangement of the stones, and the planting all combining to make a notable piece of work worthy of the gardens of such a body as the Royal Horticultural Society. At Brockenhurst, in Sussex, art has been employed to assist nature. The subsoil of a steeply sloping meadow was found to be rock, and, by a clever series of excavations, an effect of crag and chasm has been produced. These have been skilfully planted to enhance the effect so greatly that it appears almost a dream garden. Such a seizing of the opportunities provided by the site, and developing them to the utmost, seems to be the true aim of the garden designer.

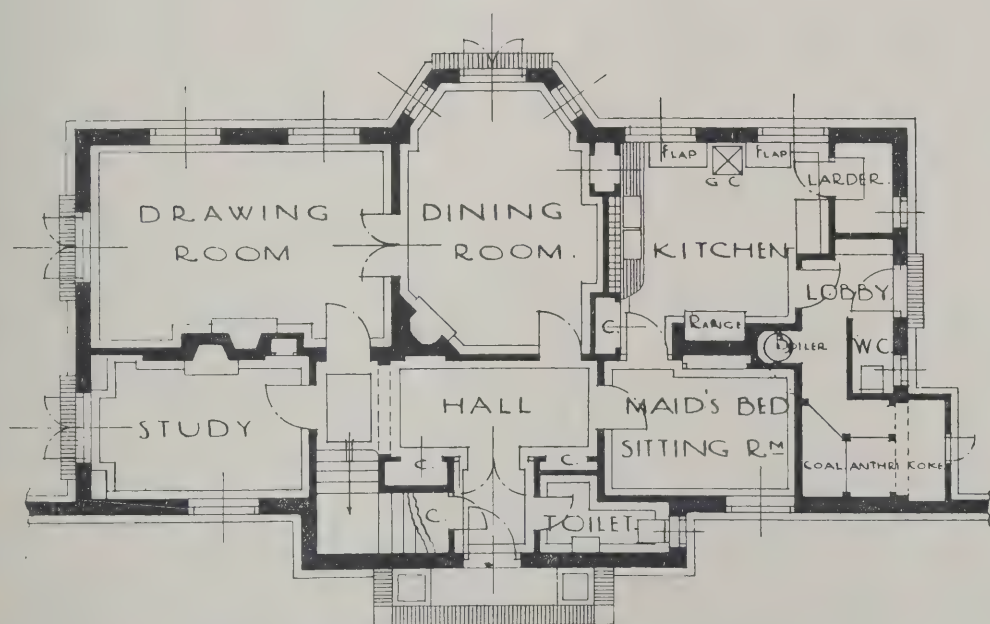

A new era has dawned as a result of the war, and has already gone far in destroying the largest country houses and their gardens. However, many survive, and English country houses and gardens are still the study and delight of foreigners from all over the world. While large gardens laid out since the war are few in number, the advent of the motor car has enabled thousands of the people who work in London and the larger cities to achieve their ambition of possessing a modest country house and garden of their own, to which they can return when the toil and moil of the day is over.

Most of these people have no ideas upon garden design, and up to the present we seem to have produced very few members of what in America appears to be a growing profession with numerous practitioners—who call themselves Landscape Architects—and have a society of their own. It would appear desirable either that architects made themselves more competent to deal with garden design by a study of the gardening side of the subject, or that some of the students, after studying architecture in our schools, should learn practical gardening at Kew or Wisley, or as a pupil to one of the bursary gardeners, and then start in practice as Landscape Architect.

Not so long ago, architects took up lay-out of estates and showed owners that the auctioneers and surveyors had misused their opportunities. The magic words "town planning" were invented, and another catch phrase, "garden city." Both tickled the ear of the public, and as there were architects of imagination behind the movement, who took pains to study the reasons why some towns were beautiful and others ugly, the movement thrived, and appears likely to have a far-reaching effect on the England of the future. There is one danger in the movement which may give it a definite set-back and cause odium to be thrown upon it. That danger is that the practice of town planning tends to drift towards the town surveyor-engineer type of designer who knows all about finance, traffic requirements, road formation, drainage, and the placing of shopping centres, houses, factories and workshops in a co-ordinate scheme, but knows little or nothing of architecture and still less of garden design.

The lay-out and planning of the new streets and roads are far in advance of most of the work of the last century, but the lay-out at the back of the houses shows little if any improvement. It is hoped that architects will not let town planning slip from their grasp in the same way that they have allowed decorators to filch all the best work inside our houses. It is only by acquiring a knowledge of garden design, or by working in collaboration with the landscape architect.

The vote of thanks to Mr. Jenkins was proposed by Mr. Inigo Thomas and seconded by Mr. Stevenson.

A detail of the Sculpture.

A MONUMENTAL GROUP IN CONCRETE

"The Fountain of Time" in Chicago, by Lorado Taft

By HOWARD ROBERTSON. Photographs by F. R. YERBURY.

There are very few townships, ancient or modern, which have spent large sums of money on Art for Art's sake. As a rule, even decorative monuments and buildings serve some definite purpose, as a reminder of persons or things, and so generally is this the case that it is almost with incredulity that in these days of value for money one hears of the erection of a huge monument dedicated to nothing more practical than human thought and beauty.

It is almost more of a shock to realise that this feat has been accomplished, not in some great European capital with an art heritage of hundreds of years, but in the big young bustling city of Chicago, where strangers always expect to find only stockyards, factories, and gunmen.

The authorities of Chicago most certainly deserve all credit for having the faith and vision to allow Lorado Taft, when he came to them with his dream of a great Fountain of Time in Washington Park, to go forward with a decorative work of so imaginative a nature and on so huge a scale. If Taft, the

sculptor, had been a lesser man, if the work had proved a failure, how loudly would the community have called for the blood of those responsible! It would be crime enough to inflict one permanent eyesore on the public in the shape of a defective figure of sculpture, but think of the effect of a hundred sculptural disasters!

The idea of the Fountain of Time seems to have come to Lorado Taft in the way that ideas should come to an artist, urged upon him rather than sought for. It was in the main suggested by a setting, and must have grown in the way that to Leonardo da Vinci came ordered visions from the play of light and dark upon the stained surface of a wall. But in the case of Taft the setting was a real and very fine one, altogether worthy of the broad sweep of sculpture which marks the end of a spacious stretch of boulevard which passes through the Campus of the Chicago University. Illinois generally, and Chicago especially, is level, and apart from the emotional interest of his idea, Taft has infused into his great mass of sculp-

The giant figure of Time.

tured figures something of the wide flat rhythm of the surrounding landscape.

The interest of the Fountain of Time lies in two main directions, the first being its abstract beauty of design, the second the wonder of its construction, for the Fountain is one of the few successful examples, on a considerable scale, of sculpture executed in concrete.

As regards the inception of the idea, Lorado Taft has described it in an address in which he dealt with those of his works which have been erected in concrete. His own words are more vivid than any other possible description.

"I have lived long on Chicago University property. Looking out of my window daily, I began to embroider this broad avenue with imagined sculpture. I wondered what they would do with it in Europe—how it might be embellished—just as a decorator would look at a wall and wonder what he would do with it. Naturally I thought of a fountain at either end, a monumental fountain to make a vista. We Americans seem to think a vista is a hole to look through. In Europe it is something to look at. It was not easy to think up a subject for a monumental fountain, but one was given to me for the east end of the avenue. It was derived from two little couplets written by Austin Dobson—all I ever read of Austin Dobson. Fortunately, I did not read a whole book, for these two lines kept me busy for some seven years. 'Time goes, you say. Ah, no; Time stays, we go.' I tried to think how that could be expressed in sculptural terms. Time, like a crag, something like my Black Hawk; and humanity I could see as a series of waves betokening the ephemeral. I think it was Huxley who used to say, 'The individual drop rises and falls; the wave sweeps on.' I remember I first designed it with Time in the centre of a circle like a ringmaster, and these waves going round and round him; but I thought the public would soon get on to the fact that they were just chasing themselves, and

it seemed better to draw them out into a procession. I made my little models, and then, to my great surprise and almost consternation, the thing found favour in the eyes of people in authority and they gave me the order to go ahead with it. This was very embarrassing to an artist who is accustomed to dreaming only. They asked me what it would cost. I estimated that it would cost me about ten thousand dollars a year for five years. That was just a guess. It cost it all right, for it took me six years or more to make the model. The World War interrupted the work. After, I had to consider material. I do not want to hurt my friends who quarry Georgia marble, but I learned after a while that in one of our cemeteries marble was no longer considered, that marble was not standing the strain of our climate, so I regretfully gave up the marble. Meantime the procession had got to be 120 feet long; there were ninety-nine figures and then a baby—we hadn't expected the baby—that made it an even hundred. And there we were! Really it was embarrassing for one who had put it out there as a kind of trust fund. I had been using \$50,000, and now the plaster was waiting. I could not bear to think of putting that thing in bronze. I like bronze for certain purposes, but I had conceived of this as something white and foamy, like the waves, and to put it in bronze seemed to me very incongruous. They talked of Bedford stone. I have great respect for that material, but it did not appeal to me in this case, and there remained the great problem of getting it carved. I would much rather have seen it in white granite. In discussing the matter with one person and another, I got into touch with Mr. Earley. It proved rather hard to interest him at first. He was pleasant and courteous, but he has his dreams, too, and has been working on his material like another Della Robbia, trying to find something that would be serviceable, artistic and appropriate for the various uses of architecture. He has found it. I am confident that he and some of the other experts in concrete are

"THE FOUNTAIN OF TIME," CHICAGO. LORADO TAFT, Sculptor.
The sculptured group, 115 feet long, which passes before the giant figure of Time.

on the verge of one of the greatest steps forward in American architecture and American art in general. Mr. Earley finally became interested in the fountain."

It is from this point on that the sculptor ceases all mention of his own endeavour, and describes the possibilities of concrete as it might be if the promise of the material as utilised for the Fountain of Time is confirmed by still further experiment.

To begin with, the texture and colour of the material are beautiful. There is none of the leaden dullness of concrete as we most often see it. The tone of the sculpture is a warm brown-yellow, and the surface is as if a sand-faced finish had been magnified a hundred times. It in no way suggests a stone, still less does it recall a plaster. It is not an imitative finish, but natural and fine. And it has a suggestion of weather-beaten softness of contour which lends to this long line of figures a kind of dream-like quality which is astonishing in sculpture exposed to the strong harsh light of a bright American day.

The actual process by which the group was erected is a monument to patience and accuracy on the part of Mr. Earley, who has described the various stages of the work which our pictures illustrate.

"The first stage shows the wooden contours assembled on a structural concrete base. These contours have been arranged to include forming for beams and buttresses which were required for the construction of the group and which are on the inside of it. One of the interesting features of this group is that it was constructed not as a mass, but as a building; it consists of foundations, basement, walls, roof, beams, buttresses, partitions, and even includes plumbing to carry away the water which would otherwise have lain on the horizontal surfaces and in the depressions."

In the second stage we see the contours covered, a part of the mould in place, and a portion of the finished work. The two pictures show the principle which governed the execution, namely, the use of a

light hollow casting and a mould which was unusual, in that it was not a receptacle into which the casting material was poured, but a form under which the cast was built up.

The wooden contours followed the general configuration of the mould, but at a distance of 6 inches below it. These contours were then covered with metal lath and cement mortar. Above these were placed the moulds, and in the intervening space between the two was poured the concrete. After a proper interval for hardening the moulds were removed and the surface of the concrete brushed and treated with acid to expose the aggregate. The mould consisted of about 4,500 pieces, and was subdivided at twenty-six "stations" to enable the work of pouring to be dealt with in sections.

The use of concrete for this huge group, which is about 115 feet long, is a tribute to faith in the lasting qualities of Portland cement. Two hundred and fifty tons of concrete were poured into the casts, and the whole of it is made with Portland cement and white cement.

From the artistic standpoint the Fountain of Time is not only a beautiful but an emotionally stirring conception. Its execution in concrete is in every way worthy of the design, and can be fairly said to represent a modern engineering triumph.

[The author has pleasure in acknowledging his indebtedness to Mr. Frederic Coleman for information and progress photographs descriptive of the construction of this monumental group.]

Princess Mary Viscountess Lascelles last week inspected the Scottish National War Memorial Shrine, now being erected on the Castle Hill at Edinburgh. The memorial, of which Sir Robert Lorimer, A.R.A., is the architect, will be opened by the King and Queen in July. Her Royal Highness afterwards opened the Memorial Gateway of the Royal Scots Regiment at the entrance to the barracks.

THE LYTHAM SCHOOL COMPETITION

As recently announced, the Governors of the Lytham School Charities invite a limited number of selected architects to submit designs in competition for the public secondary school for girls proposed to be erected on a site in the ancient parish of Lytham. Mr. Arnold Thornely, F.R.I.B.A., 612 Royal Liver Building, Liverpool, has been appointed assessor. Premiums of £250, £150, £75, and £50 will be awarded respectively.

A design shall be excluded from the competition for any of the following reasons: (a) If sent in after the period named (accidents in transit excepted); (b) If it does not give substantially the accommodation asked for; (c) If it exceeds the limits of site as shown on the plan issued by the "Promoters"; (d) If the assessor shall determine that its probable cost will exceed by 10 per cent. the outlay stated in the instructions; (e) If any of the conditions or instructions other than those of a suggestive character are disregarded; (f) If a competitor shall disclose his identity or attempt to influence the decision.

The "Promoters" desire to provide school buildings in the first instance suitable for not less than 250 day scholars, and planned with a view to convenient extension for an additional 100. It is suggested that the architectural character of the buildings be designed to harmonise with the King Edward VII. School, the boys' secondary school erected some years ago by the "Promoters," and which is built of red facing bricks with Portland stone dressings sparingly used, and green slate roofs. This suggestion does not imply that the new buildings need be a copy of the boys' school.

The coast is subject to violent storms of wind and sand. The design of the buildings and the materials used must be such as to withstand these storms. The "Promoters" desire that the cost of those buildings which are intended to be erected in the first instance, including draining and sewerage, means of heating, gas for cooking, water supply, ventilating, electric lighting (wiring only), fire extinguishing apparatus, all architectural embellishments shown on the drawings as part of the design and all fixed fittings, shall not exceed the sum of £50,000. The sum of £50,000 is not intended to include the cost of boundary walls, fencing, laying out grounds, and the levelling of the site, or school furniture; nor is it intended to include the provision for the future extension.

On the block plan hereinafter referred to must be indicated the lay-out of the site, providing in the first instance for two playgrounds, each for 175 girls (allowing about 50 sq. ft. per scholar), three hard and three grass lawn tennis courts, two full-size hockey grounds, and all paths, approaches, etc., must also be denoted. The remainder of the site is to be left for future development. It is suggested the buildings occupy a position near the north-west corner of the site and should face Clifton Drive. In order to avoid the traffic on Clifton Drive, it is desirable there

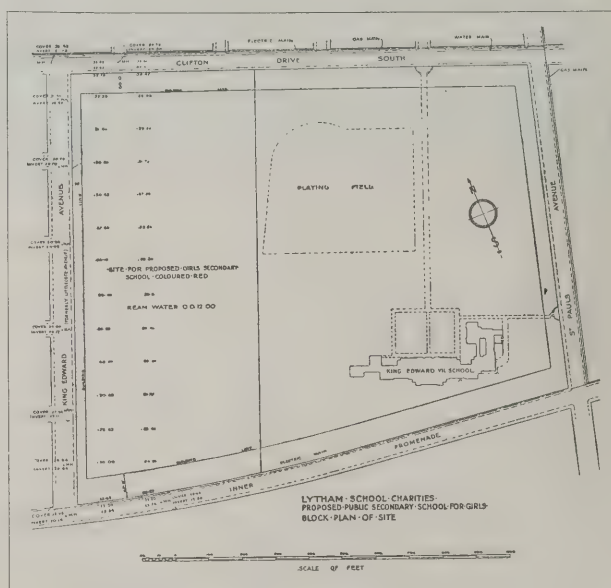

should be a suitable entrance for all the girls from King Edward Avenue. The nature of the site is sand for a considerable depth. The level of the "ream" or sub-soil water is O.D. 12-00.

Accommodation—6 classrooms for 30 each (fireplaces not required), 2 classrooms for 25 each (fireplaces not required), 1 classroom for 20 (fireplaces not required), 1 science lecture room counting as classroom for 30 (Note.—All desks to be indicated on plans), 4 classrooms for 25 each (these to form the future extension). Special Rooms—Assembly hall about 2,400 square feet including platform, with end gallery for about 100 and cinema lantern room, 1 laboratory (chemistry), about 900 square ft., preparation room and store, 1 laboratory (physics) about 900 square ft., benches, fittings, drainage, fume closets and demonstration table to be indicated on plans, dark room, art room about 900 square ft., and small store; gymnasium about 60 ft. by 30 ft. and apparatus store (to be easily accessible for use by boys of the King Edward VII. School); domestic science room

and store or larder for housewifery, laundry, and cookery classes, about 900 square ft.; library about 750 sq. ft. Staff Rooms, etc. — Head Mistress's room, assistant mistress's room, separate cloakroom and lavatory accommodation for head mistress and assistant mistresses, secretary's office, book store, medical inspection room (with lavatory attached) and dressing-room adjoining. Cloakroom accommodation — Senior girls' cloakroom for 175 scholars, junior cloakroom for 175 scholars (each with drying room for wet clothing), lavatories, girls' offices, two changing rooms each adequate to allow 40 girls to change

at one time (it would be convenient if one of these rooms were near the gymnasium), caretaker's sink-room on each floor. Dining accommodation—Dining-hall for 120, kitchen, scullery and service, larder and store, coal, servants' cloakroom and lavatory. Miscellaneous—General store about 200 square ft., heating chamber and fuel store, games store, cycle shed to accommodate 60 bicycles (not necessarily part of the main structure). A caretaker's house or flat to be incorporated in the buildings, comprising living-room, parlour, scullery, usual offices, 3 bedrooms, bath-room, and w.c. Size of rooms to be equivalent to a Government subsidy type of house.

Drawings required—Block plan drawn to a scale of 50 ft. to an inch, showing the position of the buildings, main lines of drainage, sewers and roads, and suggested lay-out of the site; plan of each floor to 1-16-in. scale; sufficient sections to illustrate the design, 1-16-in. scale; at least four elevations, 1-16-in. scale; a portion of one elevation to ¼-in. scale. No perspective drawings will be permitted. Superficial areas to be marked on each room, heights on sections, and the latter to clearly denote the ground floor level in relation to the level of the roads. All drawings must be on white sheets of paper size 30-in. by 22-in., mounted on cards of the same size, without borders.

TEMPLE BAR TELEPHONE EXCHANGE, LONDON.

Elevation to Russell Street from the colonnade of Drury Lane Theatre.

J. H. MARKHAM, F.R.I.B.A., Architect.

They may be in pencil or ink. All walls on plans and sections to be blacked in for the present scheme, and to have a light neutral tint for the extensions.

We give below a critique of these conditions.

This is a limited competition for a certain number of "selected" architects. There are no features of the "programme" calling for special comment. It will probably be worth while on such an exposed site, described as "subject to violent storms of wind and sand," to ascertain from which direction these storms proceed. Otherwise the orientation of the building would seem to be a simple problem, for, as the main frontage faces north, the class-rooms will naturally be situate towards the south, where the future building extension will also take place. It appears to be the object of the promoters to avoid making the new school compete with the old. An interesting problem of architectural design is involved in the determination of the relationship between the façades of the two buildings. While expressing its most modern characteristics, the girls' school should yet be markedly different in appearance from that of the boys'. In what precise respects these differences should manifest itself is, however, a matter for conjecture. No indication is given as to whether it is considered obligatory or desirable to have all the apartments on one floor. The school buildings have an ideal site, and a fine scheme should result.

Correspondence

To the Editor, THE ARCHITECT & BUILDING NEWS.

Architectural Staff Salaries

SIR,—Arising from my letter which appeared in your columns last week, I have received several letters from many parts of the country congratulating the A.A.S.T.A. for its stand on behalf of salaried architects. May I be permitted to quote from one of them, which throws more light on the value placed on these men's services, this time in the Government service.

"May I draw your attention to the commencing scales of salaries for surveying and architectural assistants awarded by the Arbitration Court for Government servants: (1) Quantity Surveyors (graded as Assistant Surveyors, P.A.S.I. qualifications).—Salary £170 per annum, plus variable cost of living bonus; equal to a weekly salary of about £5 5s. (2) Assistant Surveyors (graded as Surveyors' Clerks).—Salary £120 per annum, plus variable cost of living bonus; equal to a weekly salary of about £3 14s. (3) Architectural Assistants (graded as Draughtsman).—Salary £140 per annum, plus cost of living bonus; equal to a weekly salary of about £4 6s. per week. Applicants for the above posts must be ex-Service men, and the minimum age must therefore be about 27 to 30 years."

If any doubt still exists that the profession of architecture and surveying can continue without a basic minimum scale of salaries, such revelations must effectively dispel it. The quality of work is very often deplored, but it will generally be found that the standard varies as the salary accompanying the post is good or bad. Good salaries will invariably command efficient service, and the operation of basic minimum salaries will attract the best type.

Yours faithfully,

JOHN MITCHELL.

Association of Architects, Surveyors and
Technical Assistants, 26 Buckingham
Gate, Westminster, S.W.1.

Coming Events

The Royal Academy of Arts.—Friday, March 25.—Sending-in day for Architectural Drawings. 8 a.m. till 10 p.m. Burlington Gardens Entrance.

Hampshire Architectural Association.—Friday, March 25.—Council Meeting. The Castle, Winchester.

The Surveyors' Institution (Surrey Branch).—Friday, March 25.—Paper to be fixed. Dorking.

Royal Institute of British Architects.—Monday, March 28.—Special and Business Meetings: Election of Royal Gold Medallist. 9 Conduit Street, W.1. 8 p.m.

The London Society.—Monday, March 28.—Visit to Southwark Cathedral. 3 p.m.

Manchester Building Trades' Exhibition.—March 29-April 9.—Particulars from Provincial Exhibitions, Ltd., City Hall, Manchester.

The Institution of Civil Engineers.—(Students' Meeting) Wednesday, March 30.—Mr. Vernon Francis Cornish, B.Sc., on "The London County Council Becontree Housing Estate." Great George Street, S.W.1. 6.30 p.m.

The Auctioneers' and Estate Agents' Institute of the United Kingdom.—Thursday, March 31.—Mr. David M. Lawrance, B.Sc., on "The Economics of the Land." 29 Lincoln's Inn Fields, London, W.C.2. 7.30 p.m.

Royal Institution of Great Britain.—Friday, April 1.—Mr. John Allen Howe, O.B.E., on "The Stones of London." 9 p.m.

Institution of Municipal and County Engineers.—The Executive and Quarterly District Meeting will be held at the Town Hall, Bradford, on Saturday, April 2, 1927. The meeting of the West Midland District will be held at the Council House, Birmingham, on Wednesday, March 30, 1927, at 5.30 p.m.

The Surveyors' Institution.—Monday, April 4.—Mr. H. Harkinson on "Building Estates." Manchester.

Design and Industries Association.—Tuesday, April 5.—Mr. H. W. Hobbs on "Modern French Decorative Art."

Liverpool Architectural Society.—Wednesday, April 6.—Mr. P. H. Lawson on "The Later Renaissance Architecture of Chester."

Joint Delegation of the Local (Yorkshire) Associations of the Institutions of Civil and Mechanical Engineers, etc.—The Second Joint Delegation Dinner will be held on Friday, April 8, in the Great Northern Hotel, Leeds. A Joint Delegation Meeting will be held at University Applied Science Department, Mapping Hall, St. George's Square, Sheffield, on Wednesday, March 30, at 7 p.m. The meeting will take the form of a discussion on the subject: "Railways or Roads."

Royal Institution of British Architects.—The visit arranged by the R.I.B.A. Art Standing Committee to the Star and Garter Home, Richmond, will take place on Saturday, April 9, and not on April 2, as previously arranged.

Manchester Society of Architects.—Wednesday, April 13.—Mr. A. Trystan Edwards, A.R.I.B.A., on "The Æsthetic Control of Architecture."

Royal Institution of British Architects.—The Annual Exhibition of Modern British Architecture will be held in the R.I.B.A. Galleries from April 27 to June 3.

The South Wales Institute of Architects.—Exhibition of Photographs of Modern Buildings. The City Hall, Cardiff. May 9-14.

Royal Institution of British Architects.—The Annual Conference of the R.I.B.A. and Allied Societies will be held in London from June 20 to 25.

The Surveyors' Institution (Gloucester, etc., Branch).—Committee Meeting at Bristol.

NEW RESEARCH LABORATORIES FOR THE MEDICAL RESEARCH COUNCIL, MILL HILL.
Messrs. FORSYTH & MAULE, Architects.

Building News in Parliament

WESTMINSTER, Wednesday, March 23.

The House of Commons has shown commendable curiosity during the past week as to the extent to which Mr. Chamberlain's Act of last year for the housing of rural workers is coming into operation. The author of this legislation originally put forward this measure as a modest attempt to meet the housing needs of land workers, but he nevertheless expressed confidence that it would lead to the reconditioning of a great many rural cottages which only need repairs to bring them up to a reasonable standard of comfort. From an answer which was given by Sir Kingsley Wood, it appears that 96 rural district councils have already made applications to be declared local authorities under this Act.

The local authority in each case, provided the sanction of the Minister of Health is obtained, can proceed to put the Act into operation in its district. Part of the money required by owners of cottages who are carrying out reconditioning will be provided by the State and part by the local authority. The Act, it will be remembered, made specific provision to prevent buildings having special architectural or historical features from being altered in a destructive fashion. Meantime, under the close scrutiny of Parliament—

an unfriendly scrutiny on the part of Labour—Mr. Chamberlain is taking the necessary steps to have the Act applied.

Interesting figures were given by the Minister of Labour (Sir A. Steel Maitland) regarding bricklayers and bricklaying at the present time as compared with the last pre-war year. It was estimated that in 1913, in Great Britain, there were 60,000 bricklayers in the building industry within the scheme of unemployment insurance, of whom 5,700 were recorded as unemployed. This compares with 71,090 insured bricklayers in July, of whom 3,145 were recorded on February 21 this year as being unemployed. The output of bricks during the last twelve months was about 6,000 millions, compared with 3,500 millions in 1913.

Many allegations of extravagance have been made recently in the Commons against the Air Ministry. The latest of these took the form of an implication that the Ministry had expended too much in the building of quarters for married airmen at Halton. The average cost of each house works out at £561, exclusive of external services such as roads, and the accommodation consists of a living-room, two bedrooms, scullery, and bathroom. Sir Samuel Hoare, the Air Minister, who defended his Department, contended that the price at which this housing scheme had been carried out would compare favourably with the cost involved in the housing schemes of local authorities throughout the country.

Decorative Details from Britannic House, Finsbury Circus, London—II

SIR EDWIN L. LUTYENS, R.A., Architect. E. R. BROADBENT, Sculptor.

Decorative Details from Britannic House, Finsbury Circus, London—II

SIR EDWIN L. LUTYENS, R.A., Architect. E. R. BROADBENT, Sculptor.

Notes in Brief

Haddon Hall, which has been unoccupied for over 200 years, will again become the principal seat of the Rutland family when the Duke takes up his residence there at the beginning of next month. The famous old mansion has been undergoing an extensive re-fitting and process of modernising, during the past year, for the purpose.

As it had been proposed to remove two ancient coffins of stone and lead respectively found under a stable which is to be converted back to its original condition as part of the Cloisters of St. Bartholomew the Great, Smithfield, the Rector has appealed to the Lord Mayor of London to use his influence to ensure that they should remain where they had lain for centuries.

The new two-span-lift bridge over Poole Quay was recently opened by the Mayor of Poole. The bridge is built of reinforced concrete and steel, and electrical power is employed for raising the spans. It connects Poole with Hamworthy, and has cost £70,000.

The second of the "British Artists' Exhibitions," in connection with Sir Joseph Duveen's scheme to assist British artists, will be held at the Manchester City Art Gallery from the beginning of May until the end of June.

The Statue of Lord Beaconsfield, in front of St. George's Hall, Liverpool, has been moved, under the supervision of Professor Reilly, and temporarily deposited on the steps of the Hall, there to await re-erection in a new position, as part of the rearrangement of the space in front of the Hall in connection with the erection of the Liverpool War Memorial.

The Bill promoted by the London and Home Counties Joint Electricity Authority, seeking powers for the compulsory acquisition of land at Duke's Meadows, Chiswick, for the erection of a generating station, has been found not to comply with the Standing Orders of Parliament in several important respects, and may not, therefore, be proceeded with this session.

The Ministry of Health has confirmed the order of the Middlesex County Council, amalgamating Chiswick and Brentford as one urban district, and the order will take effect on April 1 next.

The Highways Committee of the Surrey County Council, who were approached by both the National Trust and the C.P.R.E. to withhold permission for the erection of a petrol-filling station at Box Hill, immediately opposite the National Trust property, have expressed regret that they had no powers to prevent the erection of the station.

The bridge carrying the railway over the Kafu River, Northern Rhodesia, has been raised a distance of 5 ft., to bring it above flood water level in the rainy season. The 13 spans were raised 10 in. at a time by hydraulic jacks, concrete blocks being built on to the piers to bring them up to the required new level.

On the site of the battle in which Charles of Anjou defeated King Manfred at Bervevento, in 1266, some mediæval tombs, covered with large stone flags, have been found. Trial excavations have brought some gold jewellery to light.

The Manchester and District Congregational Board have issued an appeal for funds to build a new church at Moss Side and another at Alkrington.

Book Notices

The Art of Decorative Painting. Walter Bayes. London, 1927. (Chapman and Hall). 21s. net.

Mr. Walter Bayes, who among other things is the Principal of the Westminster School of Art, is in many ways particularly qualified to write a book upon the art of decorative painting. For one thing, his high capacity as a practical decorative painter has been well proven—his work at the Imperial War Museum alone would be sufficient to show that—and for another he is able to express his meaning and his ideas upon his subject in a pleasant, and at times extraordinarily witty, manner, which so few specialists are capable of doing, and those, moreover, who remember his regular contributions to the *Athenæum* years ago know what an able critic he is. From the architect's standpoint, this book is of more than normal value, because the author keeps ever a watchful eye on the material restrictions and conditions imposed by architectural requirements. For the student it is at once a scholarly and inspiring treatise, and for the layman delightful and informative reading on a most ancient yet vital craft. The book is admirably produced, and illustrated by a most careful selection of historic and contemporary work.

Laxton's & Lockwood's Builders' Price Book. (Kelly's Directories, Ltd.). Price 7s. 6d. net.

The features of this book are too well known to need special mention, but it is of interest to note that all the information contained in this edition has been subjected to thorough revision and correction, and we are confident that it will be found as accurate and reliable as its many predecessors. It can be said with justice, "No builder can economically dispense with its services."

The Design of Small Properties. By M. E. Bottomley. (New York: The Macmillan Company.) Price 12s. 6d. net.

Written by a landscape architect, the designedly simple plans in this book have been prepared to meet the tendency of American families to leave city apartments to make homes in the suburbs.

The Modern Gas Showroom. By a Business Architect. (Walter King, Ltd.). 3s. 6d. post free.

Law Report

Contravention of Bye-laws

In the Chancery Division on Friday, March 18, Mr. Justice Clauson heard an action by the Attorney-General at the instance of the Uxbridge U.D.C. for a declaration that Mr. James Ellis, of Park Lodge, Uxbridge, by erecting or converting a building abutting on his premises had contravened the Council's bye-laws. The Attorney-General also sought an injunction preventing him from allowing the building to stand in its existing form or an order against Mr. Ellis to remove it.

It was stated that Mr. Ellis had converted some stables into two maisonettes, which were buildings within the meaning of the various Public Health Acts. Mr. Ellis had not deposited plans as required by the bye-laws, and in addition the buildings were in breach of a number of other bye-laws.

Mr. Ellis maintained that the buildings were not subject to the bye-laws and did not come within any statutory definition which would make his work a new building or the erection of a new building.

His lordship, however, was satisfied that the operations came within the meaning of the bye-laws, and granted the claims set out in the Attorney-General's action. Judgment was accordingly entered against Mr. Ellis with costs.

The Manchester Building Trades Exhibition

March 29th—April 9th

The Tenth Manchester Building Trades Exhibition, to be held in the City Hall, Deansgate, Manchester, opens on Tuesday, March 29. Below we give a forecast of some of the exhibits, which will include a wide range of building materials and fittings, builders' and contractors' plant, and woodworking machinery. Many new products will be shown for the first time.

The stand to be occupied by MESSRS. BRITISH FIBROCEMENT WORKS, LTD., of Erith, will be constructed with the various "Fibrent" Asbestos-Cement products made by this firm.

MESSRS. THE BEAVER BOARD CO., LTD., of 133-136 High Holborn, London, W.C.1, will be exhibiting a variety of "Beaver" Board products, including "Beaver" Green Board, which has a soft, restful colour and has been prepared specially for use in nurseries.

"Blackstone" Cold Starting Oil Engines and Compressors will be exhibited by MESSRS. BLACKSTONE & Co., LTD., of Stamford.

Models of spring dancing floors, parquetry and panelling will comprise the exhibit of MESSRS. S. G. BRIERLEY, of Deansgate, Manchester.

A pavilion designed to show the constructional value of "Celotex" Insulating Board will be exhibited by MESSRS. THE CELOTEX COMPANY OF GREAT BRITAIN, LTD., of Australia House, London, W.C.2. Decorative effects to be obtained with the textured surface of this material will also be featured.

"Stonehenge" Plaster Slab Walling, a patent system of wall construction which is new to this country, and concrete posts for varying heights of fence, will be displayed at the Stand of MESSRS. THE CONCRETE UNIT CO., LTD., of Trafford Park, Manchester.

A complete line of hand mortising machines will be exhibited by MESSRS.

COOKSLEY, of 21-25 Tabernaacle Street, London. This display will include one of their Universal Woodworking Machines, comprising saw bench, planer and spindle moulder, designed for general builders' work.

MESSRS. JOHN DICKENSON & Co. (COLTON), LTD., of Fairclough Street, Bolton, will be showing examples of their asphaltic manufactures, together with specimens of the new materials. "Durasol" Bituminous Paint is one of their specialities.

At the Stand to be occupied by MESSRS. THE DREADNAUGHT MANUFACTURING AND TRADING Co., LTD., of 1 Finkle Street, Manchester, prominence will be given to a series of concrete mixers made by STOTHERT & PITT, LTD., of Bath. They will also show power hoists and other lifting tackle.

MESSRS. DREW, CLARK & Co., of "Diamond" Patent Ladder Works, Leyton, London, will be showing a range of their well-known telescopic ladders and extension ladders for contractors' use. "Raprig" scaffolding units, for quick erection and dismantling, are also to be exhibited.

MESSRS. THE ECLIPSE RAIL-TRACK LADDER COMPANY, of 60 Upper Mandlin Street, Bristol, will show a range of ladders and folding tables for builders and decorators.

Passenger lift cars and the latest designs in lift position indicators and door-opening gear will be exhibited by MESSRS. ETCHells, CONGDON & MUIR, LTD., of Mill Street, Ancoats, Manchester.

The "Ventex" Air Filter, and a display of air piping, showing bends and junctions as used for dust exhaust and heating installations, will be exhibited by Messrs. FARRELL & Co., LTD., of Sandford Road Works, Bexley Heath. They are also showing a new automatic door check.

Various patterns of "Fernden" Cleft Chestnut Fencing, and oak gates, will be shown by MESSRS. THE FERNDEN FENCING Co., LTD., of Bridge Street, Guildford.

Concrete mixers in various capacities, including the "Fowler" Hoisting Mixer, complete with a hoisting winch for lifting mixed concrete to any desired point of a building under construction, will be shown by MESSRS. JOHN FOWLER & Co. (Leeds), LTD., of Steam Plough and Locomotive Works, Leeds.

Bourgogne "Chagny" Roofing Tiles are to be exhibited by MESSRS. J. B. FOUQUET & Co., of 1 Fennel Street, Manchester.

MESSRS. HEATH & Co., of 63-65 Gt. Jackson Street, Manchester, will be exhibiting portable railway units, tipping wagons, "Diamond" Concrete Mixers, steel barrows, skips and other equipment for the general contractors' use.

An attractive display of tile fireplaces and wood mantels, together with builder's ironmongery, will be shown by MESSRS. THOMAS HUDSON'S EXORS., LTD., of 59-69 Shudehill, Manchester, special reference being made to the "L & G" Patent Fire and the "Triplex" Grate.

"Bimol" Blocks for partition walls, made from Moler earth, "Vitrolite" panels for interior decoration, and oak flooring which can be laid direct over existing floors, will be exhibited by MESSRS. HUTCHINSON & Co., of 1 North Parade, St. Mary's Parsonage, Manchester.

Automatic spring roller sun blinds, and revolving wood shutters for garages, workshops, etc., are to be exhibited by MESSRS. IRVING & Co., of 316 Stretford Road, Manchester.

The Stand being exhibited by MESSRS. L. KEIZER & Co., LTD., of 66-72 St. Anne Street, Liverpool, will be specially designed to illustrate the varied effects which may be obtained with Plywood panelling and the many purposes for which plywood can be used in building construction.

The Stand of MESSRS. LANGLEY (LONDON), LTD., and THE COURTRAI DU NORD TILE Co., LTD., of 161 Borough High Street, London, will be provided with a four-hipped roof displaying their Green Glazed Interlocking Pan-

tiles. Marseilles, Beauvais and Gilar-doni Roofing Tiles will also be shown.

MESSRS. THE LINER CONCRETE MACHINERY Co., of City Road, Newcastle-upon-Tyne, will be showing various machines for making concrete products, including several models exhibited for the first time.

MESSRS. THOMAS McRAE, of 18 Long Millgate, Manchester, will be exhibiting a variety of light-gauge copper tubes and fittings, including the "Instantaner" and "DD" Compression Joints and other accessories to modern methods of plumbing with copper.

MESSRS. THE MIDLAND SAW AND TOOL Co., LTD., of Midsaw Works, Summer Lane, Birmingham, will be demonstrating their "Midsaw" Universal Woodworker, complete with a new dovetailing attachment. This machine will do the work of a saw-bench, planer and thicknesser, moulding, mortising, boring and tenoning.

Modern fire-fighting appliances and equipment, including "Minimax" chemical hand fire extinguishers, will be exhibited by MESSRS. MINIMAX, LTD., of Feltham.

A spring floor for dancing, carried upon the Patent "Valtor" system of steel springs and girders, and fitted with automatic locking gear for rendering the floor rigid or resilient as required, is to be shown by MESSRS. FRANCIS MORTON, JUNIOR & Co., of 24-27 High Holborn, London.

A new steel "Rolador" shutter, having many advantages over steel rolling shutters of the ordinary type, will be exhibited for the first time by MESSRS. E. POLLARD & Co., LTD., of St. John Street, Clerkenwell, London, E.C.1. This shutter is adaptable for loading docks, party wall openings, garages, and shop fronts.

A variety of floorings, including composition flooring, terrazzo, wood block, parquetry, cork and rubber, will be displayed by MESSRS. THE RELIANCE FLOORING Co., of 114 Hemmons Road, Longsight, Manchester.

A new general purpose machine for single and double tenoning, cross cutting and trenching, will be shown by MESSRS. THOMAS ROBINSON & SON, LTD., of Railway Works, Rochdale.

MESSRS. J. SAGER & Co., LTD., of Canal Works, Halifax, will have a representative selection of modern woodworking machinery, especially suitable for builders and contractors, including a new machine for recessing stair strings.

Tubular Steel Scaffolding, as used for exterior and interior work, and "Conforms" Steel Shuttering, for concrete retaining walls and centering, will be the chief feature of the exhibit by MESSRS. SCAFFOLDING (GREAT BRITAIN), LTD., of 43 Lansdowne Road, Stockwell, London, S.W.8. They will also show the "Scaffixer" Scaffold Ties and a section of Heavy Suspended Scaffolding for use on steel frame buildings.

"Sasco" Super Quality and "Sasco: Cosac" Standard Quality

(Continued on page 548)

London Building Notes

BARNET.—The Barnet Union proposes to carry out improvements to their institution in West End Lane, and plans have been approved providing for the rebuilding of the casual wards and other buildings. The architects are Messrs. Trant, Brown & Brightiff, A.R.I.B.A., 332 High Road, Kilburn, N.W.6.

BATTERSEA.—The London Power Co., Ltd., Horseferry Road, Westminster, S.W.1, has given notice of its intention to build a new generating station on a site in Kirthing Street, Battersea, S.W., with a frontage to the River Thames.

BRIXTON.—A motor garage is to be built on a site of some 15,000 square feet in Effra Road, S.W., with a frontage of 90 ft. The promoters of the scheme are Messrs. Keith & Boyle (London), Ltd., whose architect, Mr. G. T. Shenstone, A.R.I.B.A., 38 Bedford Place, W.C.1, has now completed the plans.

BROMLEY.—Messrs. F. Medhurst, Ltd., drapers, propose to rebuild their shops and showrooms in High Street, Bromley, and to erect a building of three storeys. Plans have been prepared by Mr. W. Pamphilon, architect, Newman Road, Bromley.

DENMAN STREET.—It is reported that Mr. Edward Laurillard has acquired a site in Denman Street, W.1, opposite the Regent Palace Hotel, upon which to build a new theatre. Plans are stated to be in course of preparation for a building to cost about £150,000.

DUKE STREET.—A building of first-class shops and offices is to be erected on the site of Nos. 3-5, Duke Street, W.1, to plans prepared by Messrs. Hoare & Wheeler, 22 Portman Street, W.1. A building of four storeys is proposed. The builders are Messrs. G. & E. Kent, 97 Drayton Gardens, Kennington, S.W.10.

DULWICH.—The Society of Friends, Euston Road, N.W.1, through its Council for International Service, has purchased Hitherwood, a large house on Sydenham Hill, S.W., which it is proposed to adapt as an international guest house. The residence will be completely redecorated.

GREAT COLLEGE STREET.—The Royal Veterinary College in Great College Street, N.W.1, is to be pulled down and rebuilt at a cost of about £50,000. Sanction has recently been received by the Governors from the Lords to the Treasury to a grant from the Development Fund up to £35,000. Plans are shortly to be prepared.

GUNNERSBURY.—In connection with the development of the Gunnersbury Park Estate at Gunnersbury Lane, S.W., on which 400 houses are to be eventually built, it is proposed to build a shopping centre, consisting of single and double fronted shops with flats above. Plans have been prepared by Messrs. Douglas Smith & Barley, 50 Queen Anne's Gate, Westminster, S.W.1. The builder is Mr. J. Weller, Gunnersbury Lane, S.W.

HACKNEY.—The L.C.C. Education Committee propose to adapt the site of Upton House Industrial School as a

new central school. The cost is estimated at £12,360. Plans have been prepared by Mr. G. Topham Forrest, F.R.I.B.A.

HACKNEY WICK.—At the annual meeting of shareholders of Messrs. Achille Serre, Ltd., it was stated by Mr. Eugene A. Serre, chairman, that the company was outgrowing its accommodation at Hackney Wick, and had under consideration the acquisition of a plot of land on the outskirts of London on which to build a large new works to house all departments.

HAMPTON.—The parishioners of St. John's Church, at Hampton Wick, have decided to build a new parish hall, and instructions have been issued by the Church Council for the commencement of building work. The hall has been designed by Mr. Jessop Hardwick, F.R.I.B.A., Eagle Chambers, Eden Street, Kingston-on-Thames.

HENDON.—The London Telephone Service Commissioners have secured a site at Hendon, N.W., upon which it is proposed to build a new telephone exchange. Plans have been prepared under the direction of Mr. R. J. Allison, F.R.I.B.A., Chief Architect to H.M. Office of Works, Westminster, S.W.1.

HIGH HOLBORN.—Steelwork for the office building in High Holborn, W.C.2, is now being erected by the contractors, Messrs. The Somerville Barnard Construction Co., Ltd., Archangel Road, S.E.14. The builders are Messrs. F. & H. F. Higgs, Ltd., Station Works, Hinton Road, Herne Hill, S.E. The new office and shop building has been designed by Messrs. Robert Angell & Curtis, 133 Regent Street, W.1.

HORNCHURCH.—The Romford Garage and Service Co., Ltd., 7 High Road, Ilford, have decided to build a large motor garage at Gallows Corner.

KENSINGTON.—It is proposed to erect new shops and showrooms on a corner site in Brompton Road and Beauchamp Place, S.W., at a cost of several thousand pounds. A building of five floors has been designed by Messrs. Brown & Barrow, Lennox House, Norfolk Street, W.C.2, whose plans have recently been approved.

LEE GREEN.—A site in Meadow Court Road, Lee Green, S.E., has been purchased by a local firm, who propose to build a block of property consisting of motor car showrooms, with 43 lock-up garages adjoining. Plans have been prepared by Messrs. Purvis & Purvis, architects, 417 New Cross Road, S.E.

MANSION HOUSE.—Office and warehousing premises are being erected in Garlick Hill, E.C.4, for the Hudson's Bay Co., Ltd. The building will be of seven storeys. The contractors are Messrs. Trollope & Colls, Ltd., 5 Coleman Street, E.C.2. The steelwork is being erected by Messrs. David Colville & Co., Ltd., Cockspur Street, S.W. The architects are Messrs. Williams & Cox, 34 Henrietta Street, Strand, W.C.

NEW CAVENDISH STREET.—A block of property in New Cavendish Street and Hallam Street, W.1, is to be pulled down to make way for an ex-

tensive rebuilding. It is proposed to erect a block of self-contained flats with shops on the ground floor. The surveyors are Messrs. Yates & Yates, 12 Hanover Square, W.1.

NOTTING HILL GATE.—The Metropolitan Railway Co. have approved plans for the complete reconstruction of the station buildings, etc., at Notting Hill Gate Station. Provision is to be made for new platforms, booking hall, shops, cloakrooms, etc. The work will be supervised by the company's architectural staff.

OXFORD STREET.—Steelwork is now being placed in position for the superstructure of the third section of the new building in Oxford Street, W.1, between Messrs. Bourne & Hollingsworth, Ltd., drapers. The building will comprise seven floors. The builders are Messrs. F. G. Minter, Ltd., Ferry Works, Putney, S.W. The architects are Messrs. Slater & Moberley, 46 Berners St., W.1.

PARK LANE.—It is reported that the Italian Government are negotiating for the purchase of Dorchester House, which stands in a site of 1½ acres in Park Lane, W.1, for use as an Embassy.

PICCADILLY.—Foundations are now being constructed for the block of offices and flats to be built at the corner of Piccadilly and Stratton Street, W.1, to a height of nine storeys. The building has been designed by Mr. W. Curtis Green, A.R.A., 5 Pickering Place, S.W.1. The builders are Messrs. Holloway Bros. (London), Ltd., Bridge Wharf, Grosvenor Road, S.W.1.

PINNER.—The Cuckoo Estate is to be extensively developed for residential purposes, and houses costing from £1,500-£2,000 are to be erected by the owners, Messrs. Telling Bros., Ltd., builders, Eastcote, Middlesex. Plans for the houses and lay-out, which includes several new roads, have been prepared by Mr. Louis Carr, M.I.T.P., 10 Ray Road, Northwood.

SMITHFIELD.—In connection with the large building scheme of the Governors of St. Bartholomew's Hospital, referred to in last week's issue of "The Architect & Building News," it is learned that the plans for the five-floor surgical block, costing £200,000, will be prepared by Messrs. Lancaster, Lucas & Lodge, F.R.I.B.A., 19 Bedford Square, W.C.1. The erection of the new nurses' homes—of which two blocks have been built, leaving one remaining block still to be started—is under the direction of Messrs. J. Douglas Matthews, Son & Ridley, 3 Pauls Bakehouse Court, E.C.4.

WILLESDEN.—The General Council of the Willesden Hospital have decided to proceed with the extension of their institution in Harlesden Road, N.W.10. Plans have been prepared for two new ward blocks (one for women accommodating 26 beds and the other for children with 21 beds), an operating theatre, etc., the cost being estimated at £25,000. The architects are Messrs. Newbury & Fowler, Parliament Mansions, Victoria Street, Westminster, S.W.1.

MARSEILLES
ROOFING — TILES

The Week's Building News

The following abbreviations are used: U.D.C. for Urban District Council; T.C. for Town Council; R.D.C. for Rural District Council; E.C. for Education Committee; B.G. for Board of Guardians; P.C. for Parish Council; B.C. for Borough Council; M.H. for Ministry of Health; M.T. for Ministry of Transport; C.B. for County Borough; B.E. for Board of Education. Direct confirmation should be obtained before commitments, for which we cannot be responsible, are made.

ALFORD.—At the adjourned licensing sessions at Alford the justices approved the amended plans submitted on behalf of the Mablethorpe Hotels, Ltd., for the proposed new hotel.

AYRSHIRE.—Additions to the scarlet fever and diphtheria blocks of Davids-hill Hospital, the provision of a new duty-room, and the overhauling of the heating system, at a cost of £1,000, was recently agreed to by Ayrshire Northern District Committee.

BECONTREE.—The Salvation Army is to purchase a site at Becontree for the erection of a hall for use for religious services.

BELFAST.—Supplies for building purposes have been granted by the Belfast Water Commissioners in respect of the following houses: 29 in Sydenham Drive, 12 in Denorrtion Park, 11 in Ethel Street, 6 in Onslow Gardens, 5 in Kinedar Crescent, 2 in Hughenden Avenue, 2 in Sunnyside Street, 2 in Grangeville Gardens, and a restaurant at Balmoral.

BIRMINGHAM.—The Public Health Committee of the Birmingham City Council recommend that £15,000 be allocated for the erection of a new block of buildings at the General Hospital.

BOURNEMOUTH.—Messrs. Gunton & Gunton are in communication with the Bournemouth Corporation regarding proposals for the erection of a Wesleyan Church in Alma Road.

CAERPHILLY.—The U.D.C. propose to erect 50 houses under their extensive housing scheme.

CARDIFF.—The R.D.C. propose to erect 15 non-parlour houses at Whitchurch. The architects are Messrs. Richards & McLean, 5 Dumfries Place, Cardiff.

CHALFONT ST. GILES.—Milton College is being altered for an extension of the Milton Museum.

COALVILLE.—A local company is being formed at Coalville with the object of building a Palais de Danse and cinema at the corner of Belvoir Road and James Street, now occupied by some old farm buildings. A Coalville firm of architects, Messrs. McCarthy & Collings, have been employed to prepare the plans of the scheme.

COALVILLE.—The Council decided to apply for the Ministry's sanction to the erection of 20 subsidy houses, 205 previously sanctioned having all been built or being in hand.

CROYDON.—Plans passed: G. H. Dales, 10 Richmond Road, 2 houses and garages, Upfield Road; Bethall, Swannell & Durnford, 16a John Street, W.C.2, extension to shops with two floors (amended plan), London Road, Croydon; E. G. Soper, 51 Idmiston Road, S.E.27, 2 houses with garages, Grecian Crescent; F. W. Gardner, 40 Rosendale Road, S.E.21, 2 houses, Norbury Hill South-East Side; W. H. Merret & Sons, Carshalton Road, Sutton, flats, Park Hill Road and

Addiscombe Road; B. W. Hely, 2 Semley Road, 2 garages, Stanford Road; C. Lewin, 9 Cherry Orchard Road, 2 houses and garages, Duppas Hill Road and Duppas Road; W. G. Ingram, 4 Verulam Buildings, W.C.2, 2 bungalows, Downsview Road; W. Aston, Dixon Road, 179 houses and 13 garages, Dixon, Nugent, Elm Park Roads, and Whitehorse Lane; G. Parris, 11 Birdhurst Gardens, 2 houses, Dering Road; W. Sharp, 49 Chisholm Road, 2 shops with living accommodation over and 1 lock-up shop, Shirley Road, near Bingham Road; Thorman & White, 389 London Road, 10 houses and garages, Wharnccliffe Gardens; Paish, Tyler & Crump, East Croydon, 2 houses, Upfield, plots 13-14; L. W. Harris, 16 Lewin Road, S.W., 6 shops and houses, Thornton Road; P. Richardson, 136 Addiscombe Road, 14 houses, Thornton Road, adjoining Broughton Road; North, Robin & Wilsdon, 39 Maddox Street, W.1, 24 shops with flats over, Dovereourt Parade, London Road.

DUNDEE.—Reference to a new and enlarged maternity department was made at a quarterly court of the Governors of Dundee Royal Infirmary recently. The building would be of two storeys and basement.

DUNFERMLINE.—The T.C. recently agreed to the recommendation of the Housing Committee that 52 houses should be erected on the east side of Townhill Road. The scheme is for 28 houses of two apartments, and 24 of three apartments.

EASTBOURNE.—Messrs. Tatchell & Wilson have prepared plans for new masters' quarters for Eastbourne College in Old Wish Road.

EDINBURGH.—A recommendation is to be made to Edinburgh T.C. that a site in front of the City Chambers be granted for the erection of the Edinburgh Cenotaph.

EXETER.—The Governors of the Royal Albert Memorial, which houses the present library, recommend the City Council to accept a scheme costing £50,750 for a new public library, and the tender of Messrs. Stephens & Son, Ltd., Exeter, for £40,748.

FAVERSHAM.—The Council recently passed plans for alterations and additions to the Sportsman Inn, Seasalter, and the Gate Inn, Dunkirk.

FORRES.—Mr. J. Rankine, the burgh surveyor, has prepared plans for the erection of another 30 houses, estimated to cost £300 each.

FROME.—At a meeting of the Frome R.D.C., the Housing Committee recommended the building of 14 more houses at Beekington, Norton St. Philip, Wanstrow and Laverton.

GATESHEAD.—Detailed plans of the buildings for the proposed new school at Carr's Hill, Gateshead, the total estimated cost of which amounts to £32,683, have been before the Works Sub-Committee of the Gateshead E.C. The committee decided that the T.C.

be asked to approve of the plans and estimated cost, and that, subject to their approval, they be forwarded to the B.E.

GIRVAN.—The T.C. have approved of the recommendation of the Park Committee to erect a bathing station on a site to the north of Ailsa Street West, at a cost of £2,091. The contract has been placed with Messrs. T. Blair & Sons.

GOREBRIDGE.—On a report by the Housing Sub-Committee it was resolved to proceed at once with the erection of 52 houses at Gorebridge in blocks of four, 32 of the houses to be of three rooms and 20 of two rooms. It was decided that the houses should be brick and roughcast, and Mr. James D. Cairns, 63 George Street, Edinburgh, was appointed architect for the scheme.

GREENOCK.—Property in Brougham Street has just been purchased by the Greenock Picture Palace Co., Ltd., for the erection of a super-cinema.

HACKNEY.—A central school for 36 boys and a day open-air school for 13 children are proposals for the site of the closed Upton House Industrial School, Hackney.

HARROGATE.—The Royal Antiquarian Order of Buffaloes has purchased Grove House, a Harrogate mansion, for £16,000.

JEDBURGH.—Jedburgh T.C. recently approved a proposal for the extension of the municipal housing scheme by the erection of 28 additional houses on site at Friars Mount, the houses to be similar in type to those at present in course of construction on the Bongat site. Of the seven blocks, three will consist of houses of two apartments.

KEIGHLEY.—The Keighley T.C. have passed a resolution to the effect that the proposals of the West Riding County Council to acquire a certain area of land in the borough as a site for the erection of new provide secondary schools for boys and girls be approved.

LEEDS.—The Miners' Welfare Committee is prepared to make a contribution from the Central Fund of £10,000 towards the cost of erection of a new building for the Mining Department of the University.

LONDON.—The leases of The Royal Academy of Dramatic Art premises in Gower Street expire in 1930, and the Council need £25,000 altogether for the purpose of rebuilding. It is the Council's wish to establish the R.A.D.A. permanently and securely in premises that are worthy of a Royal Charter.

LONDON.—£100,000 is being asked for the extension of the South Kensington Natural History Museum.

MANCHESTER.—Flats and hostels for business girls in Manchester form part of a big scheme which will mature if report of a committee of architects and building experts, made after a tour around the city, is satisfactory.

**Protect the Timber
with
SOLIGNUM**

DRY ROT cannot exist where Solignum is used. Hidden woodwork is made permanently safe when treated with Solignum.

The cost of protecting the timber with Solignum is negligible compared with the cost of repairs and renewals.

*The hidden woodwork that should
be preserved with Solignum*

Ends of ridge boards built into walls.
Ends of purlins built into walls.
Wall plates and ends of joists.
Backs of skirtings, architraves,

MANSFIELD.—The Duke of Portland has given a site for a new church at Mansfield.

MIDSOMER NORTON.—The Midsomer Norton U.D.C. decided to apply to the M.H. for sanction to extend the present housing scheme by the erection of eight more houses.

MONMOUTH.—At a recent Monmouth Diocesan Conference at Newport, it was decided to build a cathedral for the Monmouth Diocese at a cost of roughly half a million sterling, in Newport, and to apply to the governing body of the church in Wales to create a Cathedral Chapter.

NEWPORT.—The question of a new civic centre for Newport recently came before the Parliamentary Committee of the Corporation. Officials were instructed to report on the following

NEWPORT (MON.).—M. J. J. Partidge, builder, Dos Road, Newport, is to erect 8 houses in Queen's Hill Crescent. The architects are Messrs. Page & Lawrence, Crown Chambers, Cambrian Road, Newport.

NEWPORT (MON.).—Newport Co-operative Building Society propose to build 50 houses at Maesglas. Messrs. William Jewell & Sons, builders, St. Brannocks, propose to erect a number of houses on Malpas Road.

three proposals: (1) Leaving the present Town Hall as it is, without any alteration of any sort, and the erection of extra buildings on the site opposite in Dock Street from Merchant Street to Corn Street; (2) the acquisition of the old timber-yard in Dock Street for the erection of new buildings; (3) a further report on the Clytha Park site.

OLDBURY.—The E.C. have received the sanction of the B.E. to proceed immediately with the erection of the junior department and practical instruction centre of a new school at Brissall Hall Lane, Warley.

PETWORTH.—A scheme for enlarging Petworth Cottage Hospital was recently decided upon at the annual meeting of the Governors, held at the Town Hall.

POOLE.—Extensions and improvements, costing in all about £20,000, are to be undertaken at the Poole Cornelia Hospital. An immediate commencement of the first portion of the scheme, consisting of a children's ward, new kitchen block, and the enlargement of the nurses' home, at an estimated cost of about £10,000, will be started within a few weeks.

REGENT'S PARK.—The St. Marylebone B.C. have under consideration a scheme for an open-air swimming-bath in Regent's Park, to cost approximately £12,500. The Office of Works have expressed willingness to grant a licence for a site in Albert Road at the foot of Primrose Hill and adjoining the gymnasium. The area is about 250 ft. by 150 ft., which, it is stated, would be enough for a bath of adequate size, with suitable dressing accommodation, etc.

RETFORD.—A scheme of additions to the Rampton (Retford) State Institution, at a cost of over £100,000, is practically complete. The work, accomplished by Messrs. B. Pumfrey, Ltd., has extended over the period of three and a half years.

ROCHESTER.—The Corporation have approved of the following building

plans: Offices and workshops next to 235 High Street, for Partington Billposting Co.; house, Priestfields, for Mr. R. W. Dale; bungalow, Wilson Avenue, for Mr. W. T. Hancox.

RUGBY.—A recommendation by Rugby Housing Committee that application be made to the M.H. for sanction to borrow £15,550 for housing purposes was agreed to at a recent meeting. It was also decided to accept tenders for erecting 20 houses at New Bilton for £9,256, and 8 houses at Marton for £3,480.

ROCHFORD.—The R.D.C. have decided to erect 24 non-parlour type houses in the Malting Fields.

SEVENOAKS.—The Kent C.C. are to obtain premises in Sevenoaks for the purpose of a tuberculosis dispensary.

SHEFFIELD.—The New Century Pictures, Ltd., intend to proceed with the reconstruction of the Albert Hall, Sheffield.

SHEFFIELD.—The scheme of the Carver Street Wesleyan Church, Sheffield, to build additional accommodation on the vacant land between Rockingham Street and Rockingham Lane, together with nine shops fronting West Street, is well advanced. Estimated to cost £15,500, the amended scheme provides for nine shops and a primary department above, as well as rooms for women, girls, and men.

SOLIHULL.—The Housing Committee of Solihull District Council, in a report to the Council, recommended that application be made to the M.H. for provisional approval to a scheme for the erection of 72 small dwellings. The recommendation was approved, as was also another by the Committee that a contract be entered into provisionally for the erection of 30 of the usual non-parlour type of working-class dwelling at Cornyx Lane, Solihull, at a cost of £13,060 (£435 per house).

SOUTHEND.—It is proposed by the Elementary Education Sub-Committee to erect a new school at Cromwell Road, Brittlewell, to contain three departments. The estimated cost of the building is £44,000.

SOUTHEND.—The T.C. recently approved a scheme for the erection of an electricity generating station of 25,000 kilowatt capacity at Hole Haven, on Canvey Island, at an estimated cost of £649,000.

SOUTH DEVON.—Estimated to cost £40,000, a development scheme for the South Devon and East Cornwall Hospital was recently outlined at the annual meeting of the Governors of the institution at Plymouth. The scheme provides for the addition of 94 new beds, and will necessitate the extension of the Maristow and Lopes wards, on the top of which it is proposed to build an additional ward with flat roof. The reorganisation of the out-patients' department, to include a central waiting hall capable of holding 300 people, with wings on each side, with surgical consulting room and two operating theatres on one side, with similar consulting units for the use of surgeons wards for paying patients. The scheme was approved.

SOUTHPORT.—A new cinema is to be erected in Ainsdale.

SPLSBY.—The Sanitary Committee recommended that houses be built in

the following parishes: Firsby 6; Hogsthorpe, Willoughby, and Bilsby, 4 each; Scremby, Uleby, Stickney, Welton, Little Steeping, and Huttoft, 2 each; total 30.

ST. ANDREWS.—The funds at the disposal of the Court for the building of the new residence hall at St. Andrew's University amount to £70,000. Plans of the building were submitted and approved, and the Court resolved to proceed at once with the scheme.

ST. HELENS.—The Corporation are obtaining tenders for the erection of 600 houses on various estates.

STEPNEY.—The B.C. are to erect 89 tenements and 10 shops at Vallance Road at a cost of £50,000.

STREATHAM.—Mr. D. P. Hayworth is to lay out the Elmfield Housing Estate between Leigham Court Road and Valley Road, Streatham.

STOKE-ON-TRENT.—The Sutton Trustees are to build the following houses, on the Stoke Lodge site: 30 parlour, three bedrooms; 110 non-parlour, three bedrooms; 56 non-parlour, two bedrooms.

SUNDERLAND.—The Corporation propose to erect another 104 houses on the Humbledon estate; 48 of the houses are to have three rooms and 56 four rooms.

THORNTON HEATH.—Mr. W. H. Aston, of Dixon Road, is to erect 179 houses and 13 garages at Dixon, Nugent, Elm Park Roads, and Whitehorse Lane, Thornton Heath.

TORQUAY.—Mr. W. French is to build 22 houses in Newton Road, Torquay.

WALLASEY.—The M.H. has reported favourably on the Wallasey extension scheme, and 280 acres of land is being acquired for the erection of houses for the working classes.

WALSALL.—The Housing Committee stated at a meeting of the T.C. recently that possession has now been taken of the Ida Road site, and that it is proposed to erect upon it 374 houses—80 per cent. non-parlour type and 20 per cent. parlour type.

WATLING.—A further portion of the Watling Estate, east of Edgware Road, is to be developed for building purposes, and the L.C.C. Housing Committee are asking the Council to approve a supplemental estimate of £600,000.

WEST BROMWICH.—The T.C. agreed to recommendations of the Housing and Town Planning Committee to erect a further 16 houses (12 A type and 4 B type) in Hollyhedge Road, Charlemont Estate, and to apply to the M.H. for sanction to borrow the cost.

WESTMINSTER.—A new London circus at the Westminster approach to Lambeth Bridge is proposed by the M.T. The cost, including the value of land to be surrendered, is estimated at £47,000.

WHITEHAVEN.—Mr. Herbert Walker, chairman of the Whitehaven Colliery Company, has given £10,000 for extension purposes in the Whitehaven Wesleyan Circuit.

WOMBWELL.—The West Riding C.C. are to consider shortly tenders for the erection of a "middle" school in King's Road, Wombwell. It is estimated that the school will cost about £30,000.

Building Trade Unions

In response to an enquiry, Mr. Coppock has informed us that the following abstract is an official statement of the scheme for a new confederation of the trade unions in the building industry, by which it is proposed to bring together again under one central control the unions of skilled and unskilled men. The scheme has been finally approved by the Executive Council of the existing National Federation of Building Trade Operatives, and will be circulated to the unions affiliated to the Federation. It is intended that the new confederation shall include and supersede the existing organisation. It would be governed by an elected central executive council, and for the purpose of safeguarding technical, craft, and labourers' interests it is proposed that eight groups should be formed representing bricklayers, masonry (including quarrymen and paviors), woodworkers, painters, plumbers, slaters and tilers, plasterers, and labourers respectively. Organising work would be vested in the confederation and for administrative and organising purposes the country would be divided into 12 divisions, each of which would have an adequate organising staff and a divisional secretary. These divisions would be based on London, the Southern Counties, South-Western Counties, Eastern Counties, South Midlands, North Midlands, South Wales, Yorkshire, North-Western Counties, the North-East Coast, Scotland, and Ireland. The confederation would be autonomous on all questions affecting industrial policy.

It is intended that instead of the present contribution to the National Federation of 2s. per annum per member, for which the federation acts as a general advisory body on industrial affairs and makes a provision of 5s. a week dispute pay, the contributions to the confederation should be 4d. per week per member and 2d. per week for apprentices, and the confederation would provide dispute pay at the rate of £1 a week. The scheme, it is stated, would leave the separate organisations as they are, except that the centralised body would take over entirely industrial control. No union would be able to take strike action on its own responsibility or initiative, and there could be no movement affecting wages and conditions except with the approval of the central executive. On the other hand, the affiliated societies would have control of their own domestic matters, including the contributions of their members and administration of their funds. A provision to prevent precipitate secession of affiliated societies lays down that any society wishing to withdraw from the confederation must give to the central executive council not less than six months' notice of its intention and must declare the grounds for wishing to withdraw. The matter would then be referred to an arbitration court, and until the decision of the court is made known no withdrawal is to take place, even though the six months' notice may have elapsed. Where withdrawal occurs the society concerned is to meet

its liability to the central fund up to the date of the actual secession. The scheme provides for an annual conference of members of the confederation, which would discuss policy and also act as an appeal court on decisions of the central executive. Representation at the conference would be on the basis of not more than two delegates for every 10,000 members and a further delegate for each additional 10,000 members.

The object of the scheme is to bring together in one organisation approximately half a million workers, who would include not only building operatives, but also workers engaged in the manufacture of builders' materials. Before the secession of the bricklayers, who belong to the Amalgamated Union of Building Trade Workers, and the plasterers in the Plasterers' and Granolithic and Cement Workers' Union, the present federation had about 300,000 members. The bricklayers and plasterers' unions were represented at a conference in January, summoned by the General Council of the Trades Union Congress, to consider the merging of the separate unions in the building group into one organisation, and preliminary consideration was given to the question of regaining unity through the medium of a new confederation. The scheme now before the unions makes it clear that unity must involve single centralised control, but it is hoped by those responsible for the proposals that autonomy has been presented in such a form that the difficulties which have separated two of the craft unions from those with unskilled membership may be overcome. Mr. R. Coppock, secretary of the National Federation of Building Trade Operatives, stated that the salient feature of the scheme was the establishment of a single co-ordinating force for local, district, regional, and national control. It was unlikely, however, that the members of the various unions would be asked to vote upon it for at least six months. A prominent Labour member of the L.C.C., in an interview, concurred with this view of Mr. Coppock's.

Trade Notes

In a recent communication Messrs. Bell's United Asbestos Co., Ltd., state that the directors have resolved to recommend to the shareholders, at the annual general meeting to be held on April 7, (a) The payment of a balance dividend of 2s. per share on the ordinary shares of the company, which, with the interim dividend paid in October last, makes a total distribution of 12½ per cent. for the year; (b) that £2,000 be placed to staff pensions account; (c) that £43,973 8s. 3d. be carried forward.

Messrs. Smith, Major & Stevens, Ltd., makers of the well-known "S.M.S." lifts and "Janus" door springs, of Abbey Works, Northampton, and Bolan Street, London, have appointed Messrs. R. N. Eaton & Co., 1 Foster Square, College Green, Dublin, to act as their Sales Representatives in the Irish Free State.

Housing and Electricity

The Government's new Electricity Act was the main topic of discussion at the annual dinner at the Savoy Hotel of the British Electrical Development Association. Sir James Devonshire, this year's President, presided.

Dr. S. Z. de Ferranti gave the toast of "Co-operative Publicity," and in reply the Right Hon. Charles A. McCurdy said that the vast majority of our inhabitants had no more chance of benefiting by the marvels of electricity than if they had lived in the Middle Ages.

"The Public Service of Electricity" was proposed by Sir Henry Fowler, and, in reply, Alderman W. Walker, of the Central Electricity Board, said that electricity in the home had become a fashion, and having reached that stage there was no doubt that the domestic demand for electricity would have an important bearing on the production of even the largest undertakings. If the 1926 Act did not have the result of giving the public cheaper electricity it would be a failure, and the Board would be a greater failure still.

Sir Andrew Duncan, the Chairman of the Central Electricity Board, also spoke, and said it was true that the Act had raised a very keen and legitimate controversy, but they had a way in Britain of respecting Acts of Parliament once they were on the Statute Book, and he trusted and hoped that the New Board would receive the wholehearted co-operation of the electrical industry. The Board was neither thin-skinned nor was it arbitrary or apathetic, but he realised that the work which an organisation like the E.D.A. was doing might prove to be one of the most inspiring and helpful forms of assistance that any Board could have.

As an example of the effectiveness of the British Electrical Development Association, attention may be drawn to a series of exhibition houses which have been organised in all parts of the country during the last few months. The association claims to be carrying out a great public service the immediate results of which will be to improve the amenities of British homes, and promote the interests of hygiene and labour saving, and improved production in all departments of life. The association has recently distributed nearly one and a half million booklets in connection with a competition closing on March 31, 1927, the first prize being an all-electric house or a cheque for £2,000.

Film Exhibition

Messrs. The National Radiator Co., Ltd., Hull, have arranged for the exhibition of their film showing the manufacture of Ideal Boilers and Radiators, as well as their lantern slides demonstrating their special features, in the "Renaissance" Room at the Carfax Assembly Rooms, Oxford, at 7.30 p.m., on Tuesday, the 29th inst.

HY-RIB

The Combined Reinforcement and Centering

METHOD OF USING PLATE CLIPS FOR FIXING HY-RIB TO STEEL MEMBERS.

These clips are made of spring steel and when driven on to the flange of the steelwork bite into the steel, gripping like the jaws of a vice. The Hy-Rib is secured by passing a short strand of wire or a nail through hole in plate clip and through a corresponding hole in the rib of the Hy-Rib, made by the punching tool provided for this purpose. This is a simple and inexpensive method of attaching Hy-Rib rigidly to structural steel.

Interior view of Hy-Rib wall, after receiving one coat of plaster on outside. Note plate clips for attaching the Hy-Rib to structural steel framework.

HY-RIB WALLS.

Hy-Rib can be used in conjunction with framework of either reinforced concrete, steel, timber or brickwork, and is attached either by means of wire, special clips or staples, or by grooves.

The ribs of the Hy-Rib take the place of studs, which are otherwise necessary, and do away entirely with the expense and labour of attaching sheets of lath to studs. Simply set up the Hy-Rib, plaster both sides—and the wall is complete. No studs are necessary.

The 1927 edition of the Hy-Rib Handbook, containing detailed information, will be forwarded on application.

THE TRUSSED CONCRETE STEEL CO. LTD.

REINFORCED CONCRETE ENGINEERS

22 Cranley Gardens, South Kensington, S.W.7

Building Contracts Open

ABERGAVERNNEY.—March 28.—For certain building work in connection with alterations to the institution. Messrs. Johnston & Jones, Monk Street, Abergavenny. Deposit £3 3s.

BARNSELEY.—March 28.—For the erection and completion of the Beckett Hospital. Chas. F. Moxon, architect, Regent Chambers, Barnsley.

BARNSTAPLE.—April 6.—For the erection of 22 non-parlour houses (two terraces of eight houses, one terrace of six houses) on the Mill Road and Pottington Road sites. The office of the Borough Surveyor, Castle Street. Deposit £2 2s.

BEDFORD.—March 31.—For the erection of 6 cottages at Stagdsen. The Council Offices, 81 High Street, Bedford. Deposit £2 2s.

BELFAST.—March 28.—For the erection of a rest house and playing shed at Gray Mount Open Air School, Gray's Lane, Belfast. The Office of the City Surveyor, City Hall, Belfast.

BURY ST. EDMUNDS.—April 4.—For the erection and completion of four blocks of cottages to be erected on the Grove Park housing site, Bury St. Edmunds. Roland H. Beaumont, A.M.I.C.E., Borough Surveyor, Town Hall, Bury St. Edmunds. Deposit £2 2s.

CAMPDEN.—March 28.—For the erection of houses in the parishes of Ebrington, Chipping Campden, Moreton-in-Marsh, Mickleton, and Quinton respectively, within their district. Mr. E. H. Earp, Arrow, near Alcester. Deposit £1 1s.

CO. DOWN.—April 1.—For the conversion into a Masonic Hall of premises, High Street, Killyleagh, Co. Down. Castor J. Love, Architect, 11 Chichester Street, Belfast. Deposit £2 2s.

CREDITON.—March 31.—For the erection of a block of six houses at Morehard Bishop, and a block of four houses at Poughill, near Crediton. Mr. E. O. Harding, Architect and Surveyor, 34 Prospect Park, Exeter.

DEVON.—March 29.—For the alterations and additions to the East Street Council School, Okehampton. The County Architect, 97 Heavitree Road, Exeter. Deposit £1 1s.

Building Instruction

The Board of Education are making arrangements for the following short courses to be held in the summer of 1927 for teachers in recognised technical schools, art schools, junior technical schools, evening schools and institutes, etc., in England and Wales: (1) Engineering science at Oxford, (2) electrical engineering at Oxford, and (3) building subjects in London, *viz.*, (a) building science, (b) building construction and drawing, and (c) painting and decorating. Teachers who desire to attend any of these courses must make application to the Board of Education on Form 106e. U. before April 13.

WIRING THE HOMES OF BRITAIN

This successful E.D.A. Campaign will depend for its lasting and continuous effect as a piece of propaganda on satisfied customers. Reliable wiring is the first consideration

“C.M.A.” CABLES should be used where the *best obtainable* is specified

Reg. Trade Mark No. 422219-20-21

“NONAZO” CABLES can be adapted where price must be considered, but sound work is essential

Reg. Trade Mark No. 458865

The Campaign will get the Customers; do not lose them by using “just as good” cables

North, Robin & Wilsdon, chartered architects, 35/39 Maddox Street, London, W.1. Quantity surveyor, Mr. H. A. Mackin, F.S.I., M.I.Struct.E., 10 Vigo Street, W.1. Excavation contract—The Foundation Co., London, £5,977 7s. 8d.; Nott Brodie & Co., London, £3,904 18s. 2d.; J. W. Woolnough, Ltd., Eastbourne, £3,762; J. F. Blair & Co., Ltd., London, £3,723; Wallasey Haulage, Ltd., Wallasey, £3,300; Frank Bevis, Ltd., Portsmouth, £2,870; Carkeek & Sons, Ltd., Redruth, £2,855. Structural steel.—Wright, Anderson & Co., Gateshead, £9,450; Gardiner & Sons & Co., Bristol, £9,342; A. D. Dawnay & Co., London, £8,877; Redpath, Brown & Co., London, £8,557; J. Booth & Sons, Bolton, £8,491; E. Wood & Co., Ltd., Manchester, £7,756; Boulton & Paul, Ltd., Norwich, £7,660; Lambourne & Co., Manchester, £7,220. Super-structure.—Sir Lindsay Parkinson & Co., London, £35,998; Wakeham Bros., Ply-

mouth, £35,670; Frank Bevis, Ltd., Portsmouth, £33,250; J. W. Woolnough, Ltd., Eastbourne, £32,086; G. E. Wallis & Co., Ltd., London, £29,353; T. Conway, Ltd., Weymouth, £28,700; Wort & Way, Ltd., Salisbury, £28,599; Nox, Ltd., London, £26,366; Carkeek & Sons, Ltd., Redruth, £26,360.

HELLINGLY.—For additional lavatory accommodation, etc., at Bishop Farm, Hellingly, Sussex. Mr. E. A. Chilton, A.R.I.B.A., architect, Butchers Farm, Buxted. Messrs. Turner & Gillham, £1,072 2s.; The Ringmer Building Works, £1,368; Messrs. Payne & Taylor, £1,699 12s.

HERSHAM.—For the erection of 78 houses for the Walton U.D.C. the tender of Messrs. David Weston & Co., Ltd., Blackfriars House, New Bridge Street, London, has been accepted.

HOYLAKE AND WEST KIRBY.—Messrs. William Fleming & Co., Neston, whose tender amounted to £10,618, have secured the contract for the extension to the Hoylake and West Kirby Cottage Hospital. The work is to be completed in ten months.

OKEHAMPTON.—Okehampton T.C. have accepted a tender of £3,400 for the construction of a new cattle market in Lodge Road. It was resolved that the lowest tender be accepted, that of Messrs. Gardner & Bell, of Bridgerude, for £3,400, subject to the sanction of the M.H.

KIRKCALDY.—At a meeting of Kirkcaldy T.C. it was decided to accept the offer of Mr. R. Terras, jun., East Wemyss, of £33,080 0s. 6d. for the erection of 88 houses on the Cairns Road site, and £18,087 16s. 2d. for 48 houses on the Masserene Road site, a total of £51,167 16s. 8d., the Town Clerk being instructed to obtain the approval of the B.H. The Finance Committee reported that the estimated cost of the scheme was compiled as follows: Land, £3,200; houses, £1,167 16s. 8d.; roads, £5,752 3s. 4d.—a total of £60,920. The Council agreed to borrow the money.

MANCHESTER.—The tender of Messrs. J. T. Chapman & Sons, builders, Patrieroff, Manchester, amounting to £40,740, has been accepted for the erection of the new secondary school for boys at Gorse Hill, Stretford, Manchester.

PLYMOUTH.—For erection of a new house, garage, etc., at Crownhill, near Plymouth, for Capt. Charles C. Cartwright; W. H. Hamley, Roborough, £1,795; Messrs. Solomon & Renny, Plymouth, £1,760; S. J. Moorman, Elburton, £1,687 (accepted). Plans prepared and building supervised by Lionel F. Vanstone, architect, 15 Old Town Street, Plymouth.

SEAFORD.—For additions to "Ladycross," Seaford. Mr. W. T. B. Foster, L.R.I.B.A., architect, Ladycross, Seaford. C. Morling, Seaford, £5,695; Godfrey & Sons, Seaford, £5,587; The Ringmer Building Works, Sussex, £5,276 (amended).

STOKESLEY.—The R.D.C. recently accepted the tender of R. D. Ogilvie, Dunston-on-Tyne, at £2,996 10s., for a diversion improvement at Leven Bank, near Yarm.

TEWKESBURY.—The Corporation Housing Committee recommend the tender, £5,200, of Messrs. E. Miles & Son, of Coleford, for the erection of 12 houses at Priors Park estate.

London Building Notes

(Continued from Page 534)

ST. MARY AXE.—Work is in progress upon the foundations of office and warehouse buildings to be erected in St. Mary Axe on a site near Camomile Street, E.C.1. The building will be six storeys high, the builders being Messrs. Hall, Beddall & Co., Ltd., Waterloo Bridge, Southwark, S.E.1. The plans have been prepared by Messrs. Caröe & Passmore, 3 Great College Street, Westminster, S.W.1.

ST. MARYLEBONE.—A block of flats and shops are to be erected on the site of No. 73 Portland Place, St. Marylebone, W., the L.C.C. having, on March 7, given permission for the height of the building to exceed that laid down as the maximum by the London Building Act, 1894. The architects are Messrs. Wills & Kaula, 22 Southampton Street, Bloomsbury Square, W.C.1.

TOTTENHAM.—Work is to be put in hand at once upon the erection of the proposed new post office at Tottenham, N.1, for which the Postmaster-General has now approved plans and estimates. The building has been designed by H.M. Office of Works, Storey's Gate, Westminster, S.W.1, whose chief architect is Mr. R. J. Allison, F.R.I.B.A.

TWICKENHAM.—Plans have been approved for the erection of 150 houses on the large estate in Hampton Hill owned by the Carpenters' Company. It is proposed to provide large recreation grounds, including 30 tennis courts. The plans have been prepared by Sir Banister Fletcher, F.R.I.B.A., 1 King's Bench Walk, Temple, E.C.4.

WEMBLEY.—A start is about to be made upon the superstructure of the proposed new Wembley Cottage Hospital, which is expected to cost about £20,000 to build and equip. A completely self-contained institution of 20 beds has been designed by Mr. Herbert Kenchington, 44 Bedford Row, W.C.1.

WESTMINSTER.—Foundations are being constructed for the new library, etc., which is to be erected in Orange Street and St. Martins Street, S.W.1, at a cost of about £50,000. Plans have been prepared by Mr. A. N. Prentice, F.R.I.B.A., 10 Norfolk Street, Strand, W.C. The builders are Messrs. Walden & Co., Swallowfield, Berks.

WILLESDEN.—Alterations are being carried out by Messrs. McVitie & Price, Ltd., biscuit manufacturers, to their Willesden biscuit factory, N.W.10. Plans have been recently approved for a block of buildings in Waxlow Road, N.W. The architects are Messrs. Willard, Son & Ellingham, of Market Place, Rugby.

WILLOW STREET.—A block of 41 flats are to be erected on a site in Willow Street, Westminster, S.W.1, for the Westminster City Council. The architects are Messrs. H. V. Ashley & Winton Newman, F.R.I.B.A., 14 Gray's Inn Square, W.C. The quantity surveyors are Messrs. Drower & Brighton, 28 Victoria Street, S.W.1.

EARLE'S CEMENT

G & T EARLE (1925) LTD
WILMINGTON.
HULL.

CEMENT MANUFACTURE — 4. The cement clinker is conveyed from the stores to grinding mills where it is reduced to a powder of such fineness that nearly all of it will pass through a sieve which has 32,400 holes to the square inch. The mills are long cylinders in which are contained steel balls. As the mills rotate these balls are propelled round, and crush and rub the clinker to a fine powder. The cement thus ground is conveyed to silos, and is later packed by a pneumatic packer similar to Mr Heath Robinson's design.

Manchester Building Trades Exhibition

(Continued).

Columbian Pine Doors will be the chief feature at the stand of MESSRS. JAMES W. SOUTHERN & SON, LTD., of Store Street Saw Mills, Manchester. Most of these doors will be stained and polished to show the natural beauty of the grain. "Picus" Wallboard, a new line made from Gaboon Mahogany Plywood, will also be shown.

The various uses to which Stancliffe Stone, direct from the quarries, can be applied, is to be the feature of the stand occupied by MESSRS. THE STANCLIFFE ESTATES CO., LTD., of Darley Dale, Derbyshire.

A working display of woodworking machines, with several new models, including a motor-driven cross-cutting and trenching machine, will be shown by MESSRS. WADKIN & CO., of Green Lane Works, North Evington, Leicester.

A new "Turn Lift" for garages with two or more floors, which also acts as a turntable for the cars, will be the chief feature at the stand occupied by MESSRS. WM. WADSWORTH & SONS, LTD., of High Street, Bolton. Accrington Facing Bricks and terracotta ware; "Redac" rough faced bricks; Bramley Full Stone; graded sand and gravel for reinforced concrete works and other building materials, will be exhibited by MESSRS. B. WHITAKER & SONS, LTD., of 4 Albion Street, Leeds.

MESSRS. A. WILKINSON (MANCHESTER), LTD., of 21 Charles Street, of Hebden Bridge, will be showing a

Princess Street, Manchester, will be making a feature of the "Marwell" (Back to Back) Living-room Grate and Scullery Cooker.

Patent Reinforced Door Units, made by the DOOR UNIT CO., LTD., of Park Royal, London, N.W.10, will be exhibited by Messrs. D. C. Williams, Ltd., of Smithdown Lane, Liverpool, "Pudlo" cement waterproofing powder will also be shown at this stand.

Three entirely new lines in asbestos cement products will be exhibited by MESSRS. TURNER BROTHERS ASBESTOS CO., LTD., of Trafford Park, Manchester.

The exhibit of MESSRS. WOCO DOOR CO., of Dashwood House, London, E.C.2, will consist of a structure built up with their own doors, forming both walls and roof. One interior wall of this House of Doors is to be lined with "Gyproc" plaster wallboard.

MESSRS. THE THAMES BOARD MILLS, LTD., of Purfleet, will be demonstrating the constructional and decorative possibilities of Essex Board.

A comprehensive range of builders' and contractors' plant, including concrete mixers, stone breaking and crushing machinery, and concrete carts, will be shown by MESSRS. FREDERICK PARKER, LTD., of Leicester.

MESSRS. THOS. PARSONS & SONS, of 315-317, Oxford Street, London, will be showing paints, enamels and varnishes, making a special feature of "Parso-Glaze."

MESSRS. JOHN PICKLES & SON, LTD., comprehensive range of woodworking machines for builders, including some models incorporating new features.

Incorporated Church Building Society

At a recent meeting of the Incorporated Church Building Society grants were made towards building new churches at Drypool, S. Columb £300; Kettering, All Saints, £200; Romford, S. John-the-Divine, £150.

Housing Progress in Scotland

The following figures show the progress that has been made in State-aided housing schemes in Scotland to Feb. 28, 1927:—1919 Act: complete 25,528; under construction, 22. Private subsidy schemes (1919 Addition Powers Act: completed, 2,234. Slum clearance schemes: completed, 4,833; under construction, 2,151. 1923 Act by local authorities: completed, 3,021; under construction, 864. 1923 Act by private enterprise: complete 9,072; under construction, 2,814. 1924 Act—by local authorities: complete 5,932; under construction, 13,871. 1924 Act—by private enterprise: complete 229; under construction, 21. Demonstration houses—completed, 1. Totals: completed, 50,963; under construction, 19,935.

Foundations are being constructed for the new library, etc., which is to be erected in Orange Street and St. Martins Street, S.W.1, at a cost of about £50,000. Plans have been prepared by Mr. A. N. Prentiss, F.R.I.B.A., 10 Norfolk Street, Strand, W.C.

The "John Tann" Safe Book

is more than a catalogue, its aim being also to provide a short scientific treatise on Safe and Strong Room construction.

The House of Tann have over 40 years more experience of safe making than any other firm in existence, and during the whole history of the firm dating back to 1795 no John Tann Fire and Burglar Resisting Safe has ever had its contents destroyed or stolen.

John Tann, Ltd., are in a position to supply and install Safes, Strong Rooms, Doors and every other kind of security work, from a light fire resisting Safe or door, suitable for private houses or small business premises, to a massive structure designed to withstand every conceivable contingency.

From 1795 to the present day the House of Tann have maintained their position as the world's premier Security Engineers.

This profusely illustrated book will gladly be forwarded to responsible applicants.

JOHN TANN Safes & Strong Rooms

Architects seeking the maximum security for their clients' possessions are invited to consult the Technical Dept. of John Tann, Ltd., on any question relating to Safe or Strong Room Installation.

JOHN TANN, Ltd., 117 Newgate St., London, E.C.1

More artistic fixtures
to give better light—
and to suit every purpose

MILLER
LIGHTING FIXTURES

& IVANHOE
GLASSWARE

We are exhibiting at
Drapers' Exhibition—Stand No. 11
Entrance Hall.

WE cordially invite you to come and inspect the "Miller" and "Ivanhoe" fixtures to be seen in our showrooms, either in Drury Lane—London, or George Street—Glasgow.

There you will see a representative display of lighting fixtures—scientifically designed to give better light in greater abundance—artistically designed to impart a more decorative effect. "Miller" and "Ivanhoe" fixtures are made in sizes and designs to suit every lighting purpose—whether in the home, factory, hospital or business house.

Our staff of fully experienced lighting experts is ready at any moment to give you any technical information you may require.

Progress Satisfactory

Architect : Well, is everything going along all right?

Clerk of Works : Excellently, Sir. We shall soon have the flat roof joists in position and the boarding on, ready for the Vulcanite covering. There's one thing with Vulcanite, that being applied in a series of layers the building is watertight as soon as the first layer is down, which enables finishing work on the floors below to proceed while the roof is being completed—thus saving more time.

Architect : Yes. It's excellent roofing from every point of view. Weatherproof and durable. Fire resisting too, when it's covered with sand and gravel, or with $\frac{1}{2}$ inch of tar macadam.

Clerk of Works : I think it's a great idea to have a covering which will allow the roof to be used as a recreation ground for the employees.

Architect : Yes—that's the beauty of VULCANITE. It lends itself admirably to such a purpose. It always surprises me that it costs less and not more than other roofing materials.

Clerk of Works : Yes. It's the best and the cheapest.

"VULCANITE" roofing is used under the London Building Act and the Bye-laws, etc., of all Borough and Urban District Councils; and is accepted by all the leading Fire Insurance Companies as an Insurance Tariff Roof

We shall be pleased to have your request for our Illustrated Booklet, and to supply detailed drawings and estimates free.

BUILDING WAGE GRADES

Grade Classification	A	A1	A2	A3	B	B1	B2	B3	C	C1
Standard Rates	1/8	1/7½	1/7	1/6½	1/6	1/5½	1/5	1/4½	1/4	1/3½
Labourers' Rates	1/3¼	1/2¾	1/2½	1/2	1/1¾	1/1¼	1/1	1/0½	1/0¼	-/11¼

The following are the gradings of towns in England and Wales. The rates quoted apply to all craftsmen, with the exception of those marked with an asterisk, which denotes that there is a differentiation in the rate paid to painters, details of which are given separately at foot. The London rates are :—Within a 12 mile radius from Charing Cross—all craftsmen (excluding painters), 1s. 9½d. ; painters, 1s. 8½d. ; labourers, 1s. 4½d. From 12 to 15 mile radius, all craftsmen (excluding painters), 1s. 9d. ; painters, 1s. 8d. ; labourers, 1s. 4d.

THIS IS AN ABRIDGED LIST; THE GRADINGS OF OTHER TOWNS MAY BE HAD ON APPLICATION TO THE EDITORIAL OFFICE OF THIS PAPER.

HOUSING

The subject of housing, like the poor, is always with us ; but, during the past week or two, it has contrived to get even more attention than usual from the public press. For one thing, Col. F. E. Fremantle's new book on " National Housing," with its commendatory foreword by the Minister of Health, and its concise survey, supported by a wealth of facts and figures, of Governmental schemes, has given reviewers an opportunity to enlarge upon a general consideration of this great and pressing problem. The National Federation of House Builders, too, held their annual meeting in London last week, and they had something to say about the private enterprise side of housing, as well as criticisms to offer about public housing and the State schemes in particular. Then the Property Owners' Protection Association have also held a meeting, and they were chiefly interested in the coming expiry of the Rent Restriction Act, and the possibility of the operation of the Act being further extended. On this matter, the Minister of Health is reported to have said, last week, that he did not think it at all likely that he would recommend the Government and Parliament to make any alteration which was going to produce a sudden and radical change in the relations between landlord and tenant. This is perhaps as well, for if Mr. Edwin Evans, of the Property Owners' Association, is a true prophet, there are members of that body who would take advantage of the expiry of the Act to turn out all their tenants ; and he feared, if that happened to any large extent, they would be asking for further restrictive legislation, which was one of the great dangers of ending the Act.

The House Builders' Federation have their solution for the housing problem, in the shape of State loans on generous mortgage terms, by which thrifty people will be enabled to buy the houses which members of the Federation erect. It was contended that " the housing shortage had in some ways proved a blessing in disguise by compelling many to purchase a house, who would have been content to rent a house all their lives. Now they had established security of habitation and pride of ownership, which were assets both to the citizen and the nation." That the majority of houses rising in the vicinity of our towns, through private enterprise, can be classed as assets either of the citizen or the nation is, we think,

an unwarrantable assumption ; they constitute a liability, the burden of which, the citizen, with any aesthetic feeling, is already experiencing, and which the State will, doubtless, shoulder later on. Nor do we think, the owners under duress of finding shelter, will have much pride of possession left by the time they have finished paying for their houses in fifteen or twenty years time. Our quarrel is not with private enterprise but with its products, which are just as vulgar, and meretricious as they ever were.

The Federation desire to build small houses to let, however, but they must have numerous concessions to induce them to do so. First they must be allowed to build twenty or more to the acre ; then loans to the owner up to ninety per cent. on mortgage must be obtainable, the rate of interest closely approximating to that of the borrowing authority ; the withdrawal of all war time restrictions (whatever that means) and the rating assessment to be fixed on the basis of pre-war houses of comparable size, without regard to rental. This last concession will hardly appeal very strongly to the local authorities.

One speaker at the Federation meeting opined that public authorities should leave off building villas and concentrate on small working class dwellings to let. As he did not define his terms that does not carry us very far. The houses in State-aided Schemes are hardly villas in the accepted sense, and for this we are profoundly grateful ; but it is up to the Federation to state clearly what standard of accommodation they think is suitable for a working man.

Col. Fremantle is a believer in ownership, holding the view that owners are much more likely to take care of their houses than occupiers. To that view we subscribe, but as a corollary, we believe that it is essential that they should have a house, in the first place, which is worth taking care of. We think what is required is some scheme for financially assisting thrifty members of the public to build their own houses, decently designed and soundly constructed. We are hardly persuaded that financial syndicates and speculators, keen on getting rid of their productions, as quickly as possible and at the largest possible profit, should be assisted by special concessions or State funds ; or that the houses thus erected can be regarded as assets either by the citizen or the community.

Notes and Comments

London Squares

The London Society has published a handsome brochure on the subject of London Squares and How to Save Them, copies of which, price 1s., can be obtained from the Society at 27 Abingdon Street, Westminster, S.W.1. The Bill of 1905, rejected by the House of Lords, which would have protected the open space in 437 squares and gardens, and the subsequent Act of 1906, which confirmed the sterilisation of 55 open spaces in the hands of public bodies and nine others in private possession, by arrangement with the owners, are reviewed. There are probably many other owners than these nine who would be prepared to agree to the provisions of the 1906 Act; but it is unfair to expect them to voluntarily sacrifice their rights if others are to be permitted to make large financial gains by selling their open spaces. Where, too, such properties are in trust, it is doubtful if the trustees could legally sanction such sterilisation of part of the property in their charge. It is apparent, therefore, that some kind of legal compulsion on the owners will be necessary. Under the provisions of Mr. Scurr's proposed measure, no garden square or open space may be built upon without the consent of the London County Council or (where the space is within the City boundaries) that of the City Corporation, which bodies may impose such terms and conditions as they think fit. This is good, but it hardly goes far enough, as it puts these public authorities in the invidious position of having to grant some concession to preserve the open space. The point is that London cannot afford to sacrifice any of its open spaces, and the owners have already obtained an immense return on their original speculation by the enormously increased value of their surrounding property. The London Society booklet aims at creating a public opinion upon the situation, and if that does not already exist, then the publication serves a useful and timely purpose.

The Purpose of the Road Fund

The growing resentment against applying the monies of the Road Fund to purposes other than that for which the Fund was originally instituted has found expression in a unanimous resolution of the West Riding County Council, copies of which have been sent to the Government and all Members of Parliament. The Council points out that the outstanding liabilities of the Fund exceeded the balance on March 31 last by nearly £11,000,000, without taking into account the further liabilities imposed by the transfer of £7,000,000 towards the general revenue account of the country, and the fathoming on the Fund of the outstanding liabilities of the Unemployment Grants Committee, which it is estimated will amount to £800,000 per annum for the next few years. The adverse balance, the Council opines, will probably have substantially increased by March 31 this year, and it is evident that they fear a further raid on the Fund in face of the deficit on the Budget. With an ever-increasing strain upon their resources to maintain the main roads under the increasing wear and tear of modern traffic, the West Riding Council and other County Councils are, naturally, fearful that the diversion of further sums will mean a reduction in grants from the Fund that will leave them unable to cope with their responsibilities unless an almost insupportable addition is made to the heavy burden which the ratepayers have to bear.

Building Trade Unions

The National Federation of Building Trade Operatives have completed a scheme for a new confederation of all the trade unions in the building industry, by which it is hoped to bring together under one control the unions of skilled and unskilled men engaged, not only in the building trade, but in the manufacture of builders' materials. This scheme will come before the Annual Conference of the Federation in June next, but a good many months are expected to elapse, and much propaganda work will probably be needed, before acceptance of the scheme is ballotted upon by the respective unions concerned. Acceptance would mean that the unions would all come under one centralised control in regard to the larger issues; and it is obvious that such an ambitious organisation would be fraught with very great powers for good or evil. The bricklayers' and plasterers' unions have been frankly averse from central control in the past, and the success of the new proposal rather hinges upon their acceptance of the scheme. Both trades are below the requirements of the building industry in personnel, and the strong bargaining position in which this state of things places them, induced them to secede from the Federation a short time back and to try negotiating with the employers on their own account. Under the new constitution, no affiliated body would be able to break away without giving the central administration six months' notice of its intention, and it would then be required to justify its reasons before an arbitration court. Until the decision of that court was announced it would not be able to effect its withdrawal even though the six months' notice had expired. If the new order of things contemplated brings about a better control and a prevention of sectional strikes, it will be welcomed by architects, builders and others engaged in the building industry; and the further progress of the scheme will be awaited with interest.

Peterborough Cathedral

From a statement issued by the Dean on behalf of the Restoration Committee, the work of re-roofing and securing the famous painted ceiling of the nave at Peterborough Cathedral has now been completed, and the re-roofing of the south transept is now in hand. When this is completed, all the main roofs of the building will have been put into a sound and stable state of repair. The next work to be undertaken will be the rebuilding of the roof of the south-west tower, which is in a ruinous condition and endangers the masonry underneath. This will cost some hundreds of pounds and will exhaust the present resources of the Committee. The ravages of the death-watch beetle have added to the costs of restoration, and there are fears that the timber over-roof of the eastern chapel may collapse at any time, with dire results to the delicate stone tracery of the vaulting below. This, consequently, becomes another urgent piece of work to be put in hand. It does not seem so very long ago that the architectural world was somewhat astonished by the discovery of what was then termed the "jerry building" methods of the mediævalists in the construction of the west front of the Cathedral. In the years that have elapsed, the Restoration Committee appears to have been quietly and steadily carrying on the work of upholding and strengthening this great edifice; and the further call now made for funds—about £4,500 to meet the immediate need of the current year—will no doubt find a response outside the parishes of the diocese to which the appeal is directly addressed.

STUART HOUSE, CAMBRIDGE: NORTH ELEVATION.
GEORGE HUBBARD & SON, F. & A.R.I.B.A., Architects.

STUART HOUSE, CAMBRIDGE

Of the many new buildings associated with Cambridge University, one of the most handsome is Stuart House, which has just been completed to the designs of Messrs. George Hubbard & Son, F.S.A., F.R.I.B.A.

The building is designed after the manner of the English Renaissance and does not seem ashamed of its architectural parentage. In fact, what strikes one in its design is the highly satisfactory blend of traditional decorative *motifs* with a straightforward modern arrangement of plan and window openings, and there is no feature in the style chosen which should render it unsuitable for adoption at the present time. Let us consider, for instance, the principal frontage, the north elevation here illustrated. Here we see a façade comprising two floors. The centre portion, with three bays, is projected in front of the rest and surmounted by a pediment, while on either side of it, symmetrically arranged, are narrow façades which each contain one bay, the entrance doorway being placed to the right of the pediment. The building, however, seems conscious of an important social status, for in spite of the restraint which marks the treatment of the walls, the pediment is highly ornate, for not only is it surmounted by a stone modillion cornice, but has in its

tympanum a sculptural decoration with central shield and garlands. The stone of the pediment is reflected in rusticated quoins and string courses which are united to the window openings by key-stones. The building seems to have admirable proportions. The first floor windows are subtly differentiated from the ground floor ones by being made taller, but a common scale is preserved by making the difference commensurate with the height of a single pane of glass. The stone finials above the quoins are supported by others surmounting the low parapet wall which encloses the fore-court immediately in front of the building.

The house stands well back from the street. The court is entered through wrought-iron gates resting on Portland stone piers. These gates are of exquisite design and workmanship and show how it is still possible to produce wrought-iron work comparable to the best period. The gates were made by Messrs. Bagues, the University Arms in the centre were designed by Mr. Kouge Gray, and this work was also executed by Messrs. Bagues. The building is mainly of brick from the Daneshill Brick and Tile Works, Basingstoke, the quoins and dressings being of stone from Weldon, in Northamptonshire, the stone which was used by Henry VII and his executors in the

STUART HOUSE, CAMBRIDGE: THE LIBRARY.
GEORGE HUBBARD & SON, F. & A.R.I.B.A., Architects.

building of King's College Chapel. The University Arms in the pediment were carved in oak by Mr. Robert Lindsay Clark, of Cheltenham. Mr. Clark was an Associate of the Royal Society of British Sculptors, and had exhibited at the Royal Academy. He had just finished the work, when he died suddenly.

The building is entered through a canopied door at the north-west. The doors are of oak. The floor of the hall is paved with black and white marble. The floors of the chief rooms are of deal covered with cork carpet. The staircase and upper landing are of oak. The plan is very simple and orderly. On the ground floor the clerk's room is on the east side of the hall and the library on the south side. There are approximately 12,000 books, which are mainly used for loan to local lectures and tutorial class centres in various parts of the country. The clock-face here and elsewhere is electrically governed by the master-clock in the clerk's room. It is intended that the library shall be the special home of extra mural students resident in the University. This room is dignified and spacious and seems fitted to perform its function excel-

lently. Here again the decoration is pleasing and unobtrusive, being confined to a plaster cornice to the plain white ceiling, suitable mouldings to the book-cases, and large panel with star pattern over the mantelpiece.

On the north side of the upper landing is the board room, which is panelled in oak in memory of Mrs.

James Stuart. On the south side of the landing are rooms for the secretary, the assistant secretary and the joint secretary of the Tutorial Classes Committee.

The basement under the whole building provides ample storage accommodation for syllabuses, reports and other literature. The basement also contains the heating boilers. The system used is the "Panel" system, which was adopted after exhaustive enquiry for the new Bank of England. Fireplaces are provided in the chief rooms so that there can be some heating when it is not necessary to light the furnace.

Stuart House may be commended as an excellent example of an architect's job performed with thoroughness, for in addition to designing the main structure of the building, Messrs. Hubbard &

STUART HOUSE - Cambridge

Ground Floor Plan

STUART HOUSE, CAMBRIDGE: THE DOOR TO THE BOARD ROOM.
GEORGE HUBBARD & SON, F., A.R.I.B.A., Architects.

Son also designed the wrought-iron gates and railings, the University Arms in the pediment, the memorial tablet, the shelving in the library, the clock-faces, the panelling, tables and chairs in the board-room, and the bookcase and cupboard in the secretary's room. It must, of course, be a special satisfaction to architects when their clients give them an opportunity of making all the decoration and fittings harmonious with the building itself, and Messrs. Hubbard & Son are to be congratulated both on their opportunity and on the way in which they have taken advantage of it.

Stuart House is a centre for extra-mural students, and was required to accommodate administrative offices and accommodation for the existing libraries and for students wishing to read or write there. The Board of Extra-Mural Studies were anxious to provide not merely convenient office quarters, but "a dignified home, worthy of the movement and of the University which has the honourable pre-eminence of being the founder of extra-mural teaching." Such a building they have been able to erect by the generous aid of the Local Examination Syndicate.

The site of the building is on the south side of Mill Lane, partly on the ground which was already under the control of the Local Examination Syndicate. As the illustration shows, the immediate neighbour of Stuart House is another building designed in the Renaissance manner, so the new structure may be said to be in sympathy with its architectural surroundings.

The problem of giving an appropriate character to new buildings in a place such as Cambridge is an exceptionally difficult one, because the existing colleges and other monuments are worthy of such great veneration that care must be taken not to allow the new buildings to encroach on the prerogatives of the old. What exactly these prerogatives are it is not easy to define, but they may be defined as a prerogative of style and in particular a prerogative to be prominent, to remain the principal object of interest in an historic seat of learning. For this reason any attempt at architectural novelty for novelty's sake, any "modernist" experiment of an obtrusive kind, would be distinctly out of place in cities such as Oxford and Cambridge. Messrs. Hubbard & Son, therefore, did well in making their building express a studious regard for convention, and an air of sobriety which enables it to be a modest and agreeable neighbour of the historic buildings in its vicinity. This modesty, however, is not exaggerated, for, as has already been remarked, the ornate pediment has power to draw sufficient attention to Stuart House and to remind the passer-by that the "University Extension Movement" is a very important one and well worthy of architectural celebration.

It is noteworthy that whenever this special effect of *dignity* is desired architects turn instinctively to some variant of the Classic style. This is really the secret of its extraordinary hold over us. Even the most

adventurous "modernist" must sometimes be compelled to confess that while he can give to his creations many other qualities, he finds it a little difficult to make them look dignified. That the time-honoured classic *motifs* can be and often are abused is, of course, undisputed, but nevertheless we must acknowledge that the style has an extraordinary power of expressing orderliness, social convention and an essential *decency* which architecture can ill-afford to be without. Messrs. Hubbard & Sons have shown both courage and good sense in being willing to yield to this convention. They have given to Cambridge a new building which is both scholarly and decorous.

The contractor was Mr. W. Sindall, of Cambridge, and the principal sub-contractors were Messrs. Rosser & Russell, Ltd., for the panel heating system; Messrs. Baguès, Ltd., wrought-iron gates and electric light fittings; Messrs. H. H. Martyn & Co., Ltd., joinery and carving; Messrs. Whatling & Son, bookshelves; and Messrs. Bloxam & Scuffells, steel works.

Correspondence

Architectural Staff Salaries

To the Editor, THE ARCHITECT & BUILDING NEWS.

SIR,—The timely letters which have appeared in your columns from Mr. John Mitchell, Secretary, A.A.S.T.A., cannot fail to provoke much heart searching among salaried architects. The salaries quoted are quite common, and this week the number is increased by a further notice from the County of Hereford, which requires the services of an assistant in connection with architectural and school work at £150 per annum, 5 per cent. payable to superannuation. The actual salary which will be available to the unfortunate successful candidate will be about £2 14s. 8d. per week. Not only is this less than an operative's weekly wage, but it is open to question if a general labourer would accept such terms. Mr. Mitchell mentioned the wretched salaries paid in Plymouth. I know of a case in that town where an assistant was in receipt of a disablement pension, and his employer, a private architect, paid him about 30s. a week to make up his salary to existence level! Basic minimum salaries, in my opinion and in the opinion of many of my colleagues, are an absolute necessity if such scandalous underpayment is to be checked. The A.A.S.T.A., of which I am a member, is tackling in the right manner the abuses abounding in professional life. On the occasion of the last building dispute the R.I.B.A., or certain of its more prominent members, made overtures to act as mediators. Should the occasion ever arise again, it is to be hoped that employing architects will have put their own house in order by recognising the fair claims of their salaried colleagues.

Yours faithfully,
"A.R.I.B.A."

The Salford City Council have approved a scheme for the erection of a Trades or Exhibition Hall on the Cattle Market site. It is proposed to try and interest financiers to form a limited company, with a subscribed capital of not less than £250,000, who will undertake to expend not less than £1,000,000 on the erection of the buildings and the development of the site. The Corporation will grant a lease of the site for a term of 60 years, the first seven years to be free of rent, the remainder £2,000 per annum.

The Victory Scholarship, gold medal and premium of £150 have been awarded by the Royal Institute of British Architects to Mr. Harold Thornley Dyer, of the Bartlett School of Architecture at University College, London.

Coming Events

Manchester Building Trades' Exhibition.—March 29-April 9.—Particulars from Provincial Exhibitions, Ltd., City Hall, Manchester.

Royal Institution of Great Britain.—Friday, April 1.—Mr. John Allen Howe, O.B.E., on "The Stones of London." 9 p.m.

The Institute of Transport.—Friday, April 1.—Annual General Meeting at the Town Hall, Leeds 7 p.m.

Institution of Municipal and County Engineers.—The Executive and Quarterly District Meeting will be held at the Town Hall, Bradford, on Saturday, April 2, 1927.

The Society of Engineers.—Monday, April 4.—Mr. G. C. Workman, M.S.E., on "Some Aspects of Reinforced Concrete." Burlington House, W. 5.30 p.m.

The Surveyors' Institution.—Monday, April 4.—Mr. H. Harkinson on "Building Estates." Manchester.

Design and Industries Association.—Tuesday, April 5.—Mr. H. W. Hobbs on "Modern French Decorative Art."

The Institution of Civil Engineers.—Tuesday, April 5.—Messrs. Isaac James Jones and Gerald Curry, MM.Inst.C.E., on "The Enlargement of the City and South London Railway Tunnels." 6 p.m. Wednesday, April 6.—Mr. Francis Ernest Wentworth-Sheilds, O.B.E., M.Inst.C.E., on "Methods of Preserving Structures." 6 p.m. Great George Street, Westminster, S.W.1.

Liverpool Architectural Society.—Wednesday, April 6.—Mr. P. H. Lawson on "The Later Renaissance Architecture of Chester."

The Southend-on-Sea and District Society of Architects.—Wednesday, April 6.—A General Meeting of the Society will be held at the School of Arts and Crafts, Southend, at 8 p.m. Mr. W. R. Davidge, F.R.I.B.A., will deliver a lecture on "Some Aspects of Town Planning."

The Royal Archaeological Institute.—Wednesday, April 6.—Mr. J. W. Walker, F.S.A., on "The Recent Excavation of the Priory of St. Mary Magdalene at Monk Bretton, Yorks." Burlington House, Piccadilly, W. 5 p.m.

The Worshipful Company of Turners.—Exhibits of Turning in Wood and Metal. April 6-7 (11 a.m.—4 p.m.); April 8 (11 a.m.—2 p.m.; Presentation of Prizes, 3 p.m.). The Mansion House.

Joint Delegation of the Local (Yorkshire) Associations of the Institutions of Civil and Mechanical Engineers, etc.—The Second Joint Delegation Dinner will be held on Friday, April 8, in the Great Northern Hotel, Leeds.

Royal Institution of British Architects.—The visit arranged by the R.I.B.A. Art Standing Committee to the Star and Garter Home, Richmond, will take place on Saturday, April 9, and not on April 2, as previously arranged.

Manchester Society of Architects.—Wednesday, April 13.—Mr. A. Trystan Edwards, A.R.I.B.A., on "The Aesthetic Control of Architecture."

Edinburgh Architectural Association.—Saturday, April 16.—Visit to Borthwick Castle.

Royal Institution of British Architects.—The Annual Exhibition of Modern British Architecture will be held in the R.I.B.A. Galleries from April 27 to June 3.

Electrical Exhibition.—Friday, April 29.—The Mayor of Stepney will open an electrical exhibition at The People's Palace, Mile End Road. 3 p.m.

The South Wales Institute of Architects.—Exhibition of Photographs of Modern Buildings. The City Hall, Cardiff. May 9-14.

AN INTERESTING GRILLE IN WROUGHT IRON AND GLASS BY KANTACK AND COMPANY, METALWORKERS, OF NEW YORK.

Modern Architecture

At the Annual General Meeting of the Berkshire Society of Architects, held at Reading University on March 23, Mr. Oswald P. Milne read a paper on "Modern Architecture," from which we take the following extracts.

Everyone lived in buildings made with hands, and so it was well that every man should be able to distinguish between good and bad architecture. As the Prime Minister had said: "People could avoid listening to a jazz band or seeing a film, but, wherever they went, they had to look at buildings and buildings had to look at them."

By looking at buildings of the past, they might observe that a nation wrote its history in its buildings. From these one could read what the people were like, what they did and what were the strong influences in their lives. One might also observe how climate, and the materials easily obtainable, affected the form and design of the architecture.

The development of the dwelling in England might be taken in illustration. The defensive castle of the Norman baron, in some 500 years, had grown into the Elizabethan house, which showed the progress of culture and the fact that ordered and peaceable times had succeeded days when a man had to defend himself against his neighbours. The house of the times of Queen Anne or the Georges was of a type very suitable to the needs of to-day, if a few bathrooms and labour-saving devices were added.

One could, therefore, be quite certain that we were just as truly to-day writing our history in our buildings. A few generations ahead would read from that writing that we were a pretty muddled and vulgar generation, and a queer sense of values and commerce as our god.

We had not altered our methods or organised our powers to meet the new situation caused by the development of machinery and the spread of general education. It was futile now to proceed in the haphazard way that served well enough in the past when things did not change quickly, and when the son, untroubled by book learning, learned by practice the methods and traditions of his father's craft. We now, perforce, must work in a conscious and sophisticated way. That meant, if things were to be wide, organisation and planning ahead; it meant looking at things as a whole.

Town planning was, as was also the planning of individual buildings, an art that needed long study and training, and to leave it haphazard and without guidance in the hands of the speculative builder was only to increase the "skin disease" around every town in the country, with which we were only too familiar. We had a Town Planning Act and, if we would use it wisely, we might enter a new age of orderly development.

Take the neighbouring town of Oxford as an example. Here was one of the most beautiful old

towns in England. The outskirts had been ringed in an unimaginative manner with dreary buildings. Headington is not now a happy approach to such a city, but I have seen plans of some 400 or more houses, that the Rural District Council of Headington proposed to build, that would make it infinitely drearier still. Both in lay-out and design they are so badly devised that they will spoil not only the amenities of the roads on which they stood, but of the whole neighbourhood in their vicinity. One expected horrors from the speculative builder, but that a local authority should not obtain better advice than it has done on its building operations is a tragedy. It was this sort of thing that people should rise up against, and, if they made their voice sufficiently heard, they could ensure that better things were done. The outskirts of Reading, as seen in a photograph from the air, could not make them particularly proud of the way their own town had allowed itself to grow. Growth they wanted, but orderly, seemly, and pleasant. However, here and there, much better things were being done.

Architects generally got the blame of all horrors in the way of building, though in truth by far the greater proportion of building that went on was not designed by anyone who had had an architectural training. It was rather the lack of interest, on the part of the public, in getting things better done that meant ugly towns and a despoiled countryside.

Competition Notes

League of Nations Competition

The jury which is to decide the international competition for plans for the erection of a League of Nations Hall, met at Geneva recently, and, it is stated, will probably be occupied for three or four weeks in selecting the winning plans. After the award has been made there will be a public exhibition of all the plans, which now number approximately 375 from various countries of Europe.

Guildford School Competition

The Education Committee of the Town Council recommend that the Board of Education be notified of its intention to proceed with the provision of a new school for Slyfield Green and Bellfields districts in place of the Stoke Hill School; that plans should be obtained by means of open competition among qualified architects; that a premium of 20 guineas be offered in respect of each of the second, third and fourth designs adjudged by the assessor; and that Mr. Topham Forrest, chief architect to the London County Education Authority, be asked to act as assessor.

The erection of the new Law Courts at Belfast, which are to provide accommodation not only for the Courts but also for some of the Government offices, is to be commenced within the next two months.

The Manchester Building Trades Exhibition

March 29th—April 9th

The Tenth Manchester Building Trades' Exhibition opened on Tuesday, March 29, at the City Hall, Manchester. Mr. Harry S. Fairhurst, F.R.I.B.A., President of the Manchester Society of Architects, presided at a brief ceremony, during which Sir Edwin Stockton declared the exhibition open. Sir Edwin congratulated the building and allied trades on their enterprise in organising the exhibition, and spoke of their great importance in the country at the moment.

Taken as a whole, this Exhibition is fully representative of the building and allied trades. Amongst plant and equipment the builder will here find a variety of hoisting tackle, power-driven and hand-operated concrete mixers, concrete block-making machinery, and tip wagons and turntables for the narrow-gauge track. All the mixers which are exhibited have their own particular features, in this respect consorting with the tubular scaffolding and steel shuttering to be found at one of the Stands. In the woodworking machinery section several new machines are being shown for the first time, all operations ranging from mortising and tenoning to stair housing being represented. Hardwoods and plywoods are also exhibited, together with ready-made doors and other joinery, the grain and finish of which is of more than passing interest. Tiles and other roofing materials, various floorings, wall tiling and decorative products, fireplaces and combination grates, and a small selection of sanitary ware are also on view.

Stand No. 47, occupied by MESSRS. L. KEIZER & Co., LTD., of 66-72 St. Anne Street, Liverpool, is designed to demonstrate the varied effects which can be obtained with Plywood paneling, and the many purposes for which Plywood can be used in houses, offices and shops. One of the principal items of interest is a specimen section of a Plywood floor. An interesting illustrated booklet can be obtained at this Stand showing photographs of interiors where plywood has been used for ceiling and frieze work, as well as for wall panelling and floors.

The exhibit of MESSRS. THE STANCLIFFE ESTATES Co., LTD., of Darley Dale, Derbyshire (Stands Nos. 50-51), affords an illustration of some of the varied uses to which the stone obtained from their quarries can be applied. Part of this exhibit, in the natural Stancliffe stone, takes the form of a bay window and portico entrance set in a courtyard garden enclosed by a balustrade wall. The rock gardens flanking the pathways show examples of tufa, limestone and spar rockery products which are supplied by the Company. The artificial stone exhibit is in the form of a garage showing various types of blocks and dressings for both exterior and interior use.

The Stand exhibited by MESSRS. BRITISH FIBROCEMENT WORKS, LTD., of Erith, Kent, and of 97 Bridge Street, Manchester, is constructed with the various "Fibrent" Asbestos-Cement products manufactured by this firm. The Turret roof is covered with "Fibrent" Antique Brown Slates (ladies size) laid straight; the lower slopes of the roof illustrate the use of "Fibrent" Diagonal Slates, Fibrotiles—

and Fibro-five Corrugated Sheeting. All these roofing materials are supplied alternately in grey, blue-black, red and antique brown colours. The external treatment of the walls and ceiling is carried out in "Fibrent" Corrugated and Flat Sheeting, and straight and scalloped tile hanging. For the internal walls "Fibrent" Panel Sheeting has been used. "Fibrent" Flat Sheets ($\frac{1}{2}$ in. thick) are used for the floor fixed direct to joists as a further illustration of the many uses of "Fibrent" products in modern construction.

MESSRS. THE CELOTEX COMPANY OF GREAT BRITAIN, LTD., of Australia House, London, and their wholesale distributors, THE MERCHANT TRADING Co., LTD., of 34 Bishopsgate, London, are exhibiting a pavilion which is designed to show the constructional value of Celotex Insulating Board for sound-deadening; as a damp-proof lining for interior walls and ceilings; for external walls as a base for rough-cast; for roof insulation over rafters under tiles; and as a plaster base. This exhibit also shows the many decorative effects that can be obtained on the textured surface of Celotex.

MESSRS. LANGLEY (LONDON), LTD., and THE COURTRAI-DU NORD TILE Co., LTD., of 161 Borough High Street, London, S.E.1 (Stand No. 49), have a structure with a four-hipped roof, displaying their Green Glazed Interlocking Improved Pantiles, and an enclosure in the foreground surrounded by display counters. Sections of roofs laid with Marseilles, Beauvais and Courtrai-Du Nord Tiles are also exhibited, and models of a valley and a hip demonstrate the simplicity with which these tiles can be cut.

The exhibit of MESSRS. WOCO DOOR COMPANY, of Dashwood House, Old Broad Street, London, E.C.2 (Stand No. 52), takes the form of a house constructed entirely of their own doors, which are ingeniously joined to form the walls and roof. The doors used demonstrate the various patterns supplied by the firm, and are treated with paint, stain and enamel, showing off each to the best advantage. The roof is formed of casement doors, and some of the glazing effects possible are shown in the entrance and exit. Within the house two good examples of Laminex doors are hung, including the Adelphi door with its long panel that so finely shows off the beauty of grain for which these doors are noted. One interior wall of this "House of Doors" is entirely lined with "Gyproc," a plaster wallboard made of pure gypsum packed between stiff sheets of prepared paper.

MESSRS. FRANCIS MORTON, JUNIOR, & Co., 24-27 High Holborn, W.C.1 (Stand No. 62), are showing a spring floor for dancing and gymnasiums

carried upon an installation of their patent "Valtor" system of steel springs and girders with locking gear for rendering the floor rigid or resilient as required. The timber work of this floor is supported on light steel joists. These girders are supported over the body of the floor upon "Valtor" spring fitments, consisting of steel spiral springs in iron casings, which support the floor over its entire surface when in the resilient state. The automatic locking gear consists of lines of steel bars having iron wedges bolted to them and connected at one end of the floor by a toothed quadrant mechanism. By turning the quadrant in one direction the wedges are drawn in underneath the "Valtor" girders, thus supporting the floor rigidly from the wedges. By reversing the motion the wedges are released and the floor once more rests on the springs. The mechanism is of simple construction and is metal throughout, all perishable material, such as rubber or felt, being excluded.

For garages with two or more storeys a new type of Lift, made by MESSRS. WM. WADSWORTH & SONS, LTD., of Bolton, is exhibited at Stand No. 20. This lift, which we illustrate, besides taking a car up or down, will receive it from any direction or deliver it in a like manner. The lift acts as a turn-table on each floor, and revolves by power controlled by a press switch in the same way as for ascending and descending. The guarded enclosure and gates are part of the equipment, and the whole unit revolves. By this arrangement it will be seen that damage to cars is reduced to a minimum; they can also be handled with much greater facility.

MESSRS. THE BEAVER BOARD Co., LTD., of 133-136 High Holborn, London, W.C.1 (Stand No. 37), in co-operation with MESSRS. SOUTHERN & DARWENT, LTD., of Manchester, are showing examples of Beaver Wall Board, which is wholly a British manufacture from raw material to finished product. It is made from spruce timber of Canada reduced to fibrous form and pressed into uniform panels 36 in. and 48 in. wide, and in lengths of from 8 ft. to 16 ft. They are also showing Beaver Tile Board, which is scored to give the tile effect. This product can be enamelled to give a washable surface.

MESSRS. THOMAS PARSONS & SONS, of 315-317 Oxford Street, London, W.1, have taken Stand No. 36 to demonstrate the application of "Parso-Glaze," showing the ease with which this scrubbing paint can be applied and the novel decorative effects which are produced by means of the Parson's Rubber Stippler. "Parso-Stain," which dries with a matt finish which can be waxed, oiled or varnished, is also exhibited at this Stand.

At Stand No. 60 will be found some typical examples of the comprehensive range of builders' plant produced by MESSRS. FREDERICK PARKER, LTD., of Leicester. Foremost among these exhibits is the Parker O.C. Concrete Mixer—an entirely new machine of 7 cu. ft. capacity, with a frame of unconventional design which is said to give exceptional strength and rigidity. This machine, which we illustrate, is of the "open drum" type, keeping the mix constantly in view of the operator. In general construction the drum is the same as that of the older pattern mixers, but now has specially designed blades to keep the mix moving throughout the whole depth of the drum, thereby overcoming the common tendency to separate. The inside surface of the drum is also free from ridges or recesses, and has therefore no tendency to become "clogged" with an accumulation of material. Parker Interchangeable Axles are provided, enabling the mixer to be converted from "side loading" to "end loading," whilst the loading hopper runs on rollers, using the main members of the frame as runners instead of working about a fulcrum. The lift is thereby rendered direct, and the pull from the drums carrying the cables is straight from bottom to top of the lift. This method of construction

New Motor-Driven Cross-Cutting and Trenching Machine.
(Wadkin & Co.)
Stand No. 33.

over the ordinary type of swing cross cut saw. This machine can be fixed for convenience in any position in the workshop, no overhead structure being required. The saw operates in a straight line and not in an arc, as with the swing saw, and can therefore be used for grooving or trenching operations. The saw carriage can also be turned in either direction to any angle up to 45° for angular cutting, and when necessary the saw spindle can be canted from the horizontal to the vertical position and locked at any intermediate angle. The saw is driven by a 3½ H.P. electric motor directly mounted on the saw spindle, so that all belting is eliminated. The saw has a vertical rise and fall on the main column of 6½ in. for dealing with various thicknesses of material and for greater convenience in trenching or grooving. Canted to an angle of 30°, an effective cut 20 in. wide by 3¼ in. deep can be obtained. An automatic stop bar can be supplied with the machine for dispensing with the necessity of "marking out" in repetition work.

The production of economical power is being emphasised by MESSRS. BLACKSTONE & CO., LTD., of Stamford, at Stand No. 73. The oil engine here exhibited has been designed to give the power user the advantage of instant starting from cold on any grade of fuel oil that can be pumped.

At Stand No. 24 MESSRS. JOHN DICKINSON & CO. (BOLTON), LTD., of Fairclough Street, Bolton, display examples of their manufactures in the shape of blocks of "Seal," "Tropicas" and "Aciteneo" brands of Mastic Rock Asphalte. "Seal" Brand Asphalte is used for flat-roof watertightening work; "Tropicas" Asphalte,

on the other hand, is suitable for conditions where the temperature is above normal. As its name implies, this latter is suitable for general use in Tropical and semi-Tropical countries. The "Aciteneo" Asphalte is manufactured for use in lining tanks and covering floors which are subject to corrosion by acid products. "Durasol" Bituminous Paints are also exhibited at this Stand.

"Sasco" Super Quality and "Sasco Cosac" Standard Quality Columbian Pine Doors are the chief feature at the Stand of MESSRS. JAMES W. SOUTHERN & SON, LTD., of Store Street Saw Mills, Manchester (Stand No. 76). Most of the doors exhibited are attractively stained and varnished or polished, showing the natural beauty of the grain. Some of the doors have also been painted to show that paint can be applied with equal success to Columbian Pine. They are also showing Swedish Red Deal doors in new designs suitable for use as front entrance doors. "Picus" Wallboard, which is made from Gaboon Mahogany Plywood and can be stained and varnished, is a new line exhibited at this Stand.

The exhibit of MESSRS. B. WHITAKER & SONS, LTD., of 4 Albion Street, Leeds (Stand No. 63), is built entirely of this company's products. "Redac" Rough Faced Bricks have

The New Parker "O.C." Concrete Mixer:
Details of Drum.
(Frederick Parker, Ltd.)
Stand No. 60.

been used for the elevation, whilst heads, sills and cornice are executed in "Redac" Terra Cotta. Accrington Facing Bricks, Bramley Fall Stone and "Gravamae" Tarred Surface Dressing for footpaths is also shown at this Stand.

At Stand No. 54 MESSRS. JOHN PICKLES & SON, LTD., of Hebden Bridge, Yorks, have a new high-speed Planing and Moulding Machine with a gear box feed which is of interest owing to the fact that its loose blocks may be taken out without removing either a bearing or a spindle. They are also showing a Straight Line Edger, with an endless chain feed, and a Three Drum Sandpapering Machine with an endless bed feed. The Builders' Tenoning Machine also shown is of a new design, and is suitable for single or double tenons, top and bottom scribing, and cross-cutting and trenching.

Automatic spring roller sun blinds, and revolving wood shutters for garages, workshops, etc., are exhibited by MESSRS. IRVING & CO., of 316 Stretford Road, Manchester (Stand No. 43).

The New Parker "O.C." Concrete Mixer.
(Frederick Parker, Ltd.)
Stand No. 60.

eliminates the heavy stresses on the frame, which are present in the more usual type of hopper, which merely rotates about a centre spindle, and at the same time the power required to lift it is appreciably less. Power is supplied by a Lister engine, as is the practice in all Parker machines. In this case a 5½ h.p. engine is used, which is smaller than is usually the practice in a machine of this capacity, which is capable of producing one batch per minute. The "Monarch" Light Stone Breaker, for the crushing of general builders' debris for concrete; the "Monarch" Granulator, which is largely used by municipal authorities for producing chippings for "topping" work; and "Parker" concrete carts and barrows are also exhibited at this stand.

Several new woodworking machines are included in the display by MESSRS. WADKIN & CO., of Green Lane Works, North Evington, Leicester, at Stand No. 33. The motor-driven Cross-Cutting and Trenching Machine, which we illustrate, has many advantages

Cross-Cutting and Trenching Machine:
Cutting Compound Angles.
(Wadkin & Co.)
Stand No. 33.

A wide range of machinery for making concrete products is being exhibited by MESSRS. THE LINER CONCRETE MACHINERY Co., of City Road, Newcastle-upon-Tyne (Stands Nos. 5 and 6). This display includes a new Multiple Moulding Box for concrete flags, which is capable of casting 24 flags of any desired thickness at one operation, using a sloppy wet mixture, and the new "Liner" Single Kerb-making Machine. The latter, which is illustrated, is made in three sizes, and will turn out any kerb section within its overall dimensions. The method of ejection employed is such that an extremely wet mixture can be used, so that the face of the kerb may be trowelled, giving a glass finish, or ribbed with the roller if desired. To eject the finished kerb the handle is pulled over into its forward position, this operation being reversed to close the mould. The new "Liner" Improved Tilting Drum Concrete Mixer is also exhibited for the first time. This machine is fitted with an exceptionally large diameter drum, which enables the materials to be well

The New "Liner" Tilting Drum Mixer
(Charging).
(The Liner Concrete Machinery Co.)
Stands Nos. 5 and 6.

lifted and thrown about during the mixing operation. The usual centre spindle, often sticking up into the drum is cut out, the drum shaft being carried through a rocker arm beneath the drum. This mixer, which is also illustrated, is a 7/5 model, that is, one with a capacity of 7 cubic ft. (unmixed) or 5 cubic ft. (mixed). It is complete with hand loader, which has all the advantages of a power loader for a machine of this capacity, and is directly driven by a 3 h.p. Lister petrol engine.

Three entirely new asbestos-cement products, made by MESSRS. TURNER BROTHERS ASBESTOS Co., LTD., of Trafford Park, Manchester, will be found at Stand No. 48. The "Servall" Multiple Tile is a new idea in domestic roofing—a boldly designed, readily fixed unit providing for a pantile effect, which is enhanced by its rich russet-brown colour. These units, by reason of their large size, should give greater economy in roof construction costs by comparison with roofing materials of ordinary design. (Roofing spars, for example, may safely be opened up to 3-ft. spacing with 2-in.

The New "Servall" Multiple Tile.
(Turner Brothers Asbestos Co. Ltd.)
Stand No. 48.

x 2-in. battens at 21-in. centres, flushing being carried out without difficulty in the usual manner.) Viewed from every angle, they also present a much bolder outline than has been hitherto possible, so that they show up to a greater advantage when *in situ*, at the same time giving better weather protection than that afforded by roofing materials of smaller dimensions. They can also be readily adapted to varying roof designs, being divided into multiples for varying lengths and widths, and may be used in conjunction with a close fitting two-piece adjustable roll top ridging which has been specially designed and shaped to fit the contour of the tile. "Permanite" Asbestos Cement Tiled Sheets are the second feature of interest. These sheets have all the appearance of tiles, but cost considerably less, and can be installed at a fraction of the labour cost in comparison with ordinary glazed tiles. They can be supplied in a wide range of colours with a highly glazed surface, and are claimed to be proof against discoloration or cracking. In fixing these sheets, timber studding can be used, thus cutting out the cost of plastering; brick walls should be plugged and strapped at 16 or 24 in. centres to provide a suitable screwing surface, but for existing plastered walls an adhesive preparation can be supplied to avoid the necessity for battening. Special barbed nails are also supplied for fixing these tiled sheets in a neat and effective manner. These nails have cruciform heads, the branches of which taper to a relatively sharp edge at the under side and conform to the shape of the grooves in the tiled sheet, so as to become more or less concealed therein, whilst the shank is rectangular in section and provided with barbs to ob-

New Pipe Joints for Light Copper Tube.
(Thomas McRay)
Stand No. 25.

tain an effective hold in the battens. "Permanite" Asbestos Marble, the third new product, is essentially a substitute for white, veined marble, in a fire-resisting material of lighter weight possessing a highly polished surface which is obtained without the use of varnish or enamel.

MESSRS. THOMAS MCRAY, of 18, Long Millgate, Manchester (Stand No. 25), are exhibiting a variety of light gauge copper tubes and fittings, including the "Instantan" and "D.D." Patent Compression Joints, and other accessories to modern methods of plumbing with copper. The two pipe joints mentioned are illustrated. In the "D.D." system (upper sketch), a die or forming block and two expanding tools are used to form the end of the tube into a cup-shaped seating to receive the gunmetal nipple of the union, the two being forced into watertight contact by a coupling nut. These "D.D." fittings are made in all sizes, from $\frac{1}{4}$ in. to 2 in., in a variety of couplings and connections. In the "Instantan" joint (lower sketch) a compression

The New "Liner" Tilting Drum Mixer
(Mixing).
(The Liner Concrete Machinery Co.)
Stands Nos. 5 and 6.

ring, pinched between the nut and the socket, is compressed inwards upon the tube, forming two circumferential keys in the copper which bind it in an immovable watertight joint, and at the same time making perfect contact with the socket. The corrugations shown in our sketch are, of course, exaggerated.

MESSRS. E. M. CARSON (J. B. FOUQUET & Co.), of 1 Fennel Street, Manchester (Stand No. 22), are showing Bourgogne "Chagny" Roofing Tiles and a fine red flooring tile.

The main features of Stand No. 53, occupied by MESSRS. D. ANDERSON & SON, LTD., of Park Road Works, Strretford, Manchester, are the sections of roofing showing the actual construction of a "Belfast" Roof covered with two-ply "Rok" and having a gutter formed in the felt, as well as methods of finishing at verges and against parapet walls. Other roofing exhibits at this Stand include Mineral Surfaced "Rok," "Stoniflex," and "Rok-Flexile" Strip Shingles. Damp-courses to meet the requirements of Corporations and Municipal authorities are also shown.

The New "Stonhenge" Division Walling.
(The Concrete Unit Co. Ltd.)
Stand No. 34.

A patented system of wall construction, which is new to this country, is exhibited by MESSRS. THE CONCRETE UNIT CO., LTD., of Trafford Park, Manchester, at Stand No. 34. The slabs used for this "Stonhenge" Division Walling are made of a fire-resisting and heatproof material, and are delivered to the site ready for erection. Being thoroughly dry on delivery, they can be papered or painted, without further delay, as soon as the wall is erected, for in contrast to other partition constructions this one requires no refining or plastering, the wall surface being smooth on both sides. It is also claimed to be the only partition which can, with very slight damage to the slabs, be removed from one position and re-erected elsewhere. From our illustration it will be noticed that the slab units, which are 2½ in. thick, overlap each other with an S-shaped joint, and that pointing is the only essential operation during erection. Concrete posts for varying heights of fence, and examples of pre-cast stonework from contracts now being carried out by this firm, are also displayed.

An interesting exhibit of exclusive fireplaces, sanitary ware, and electrical fittings is being shown by MESSRS.

JOHN CHEW & Co., LTD., of Lord Newcastle-upon-Tyne (Stands Nos. 5 10 and 11). Prominent among these is a fireplace suite with the interior and fire done in engraved rustless steel surrounded by Swedish marble. This firm is also showing dog fires done in rustless steel and oxidised copper, with a variety of tile interiors. In the sanitary goods, the merits of Chromium plated taps over white metal receives special emphasis.

At Stand No. 77 MESSRS. E. POLLARD & Co., LTD., of St. John Street, Clerkenwell, London, E.C.1, and of 84 Oldham Street, Manchester, are showing a patented rolling shutter for loading docks, party wall openings, garages and shop fronts, with several new features. This shutter, which is known as the "Rolador," is constructed on the interlocking principle with laths of 14 gauge cold rolled steel, and is made in two models—a standard one, where the lath is designed to throw off the rain, and a fire-resisting one, with the lath fitting tightly against the groove flange so that flame cannot creep through. The shutter itself coils upon hexagonal boxes, and the laths vary in width, the narrowest being fitted at the top so that each lath when coiled fits down correctly upon the lath beneath it. In this way although the new laths are twice as thick as those of an ordinary interlocking shutter, a coil of approximately the same size is obtained. The hexagonal boxes revolve on roller bearings instead of plain end bearings and these are designed to distribute the weight along the steel rod which supports the interlocking laths. This supporting rod is also mounted on sliding end bearings, which allows the first and last of the laths to fall into the grooves of the framework with equal smoothness. "Rolador" parts are standardised and are pressed out of the solid with dies, the laths being turned up cold by special machinery.

The exhibit of Messrs. Heath & Co., of Diamond Works, 63-65 Gt. Jackson Street, Manchester (Stand No. 72), includes portable railway units built in their own works; tipping wagons and oscillating turntables; steel barrows, crane skips and other engineering products. They are also exhibiting their "Diamond" Concrete Mixers, in both hand-driven and power-driven types, and a range of lifting appliances suitable for builders and contractors.

Amongst other woodworking machinery at Stand No. 41, MESSRS. A. COOKSLEY, of 21-25 Tabernacle Street, London, E.C.2, are showing their Universal Woodworking Machine, comprising sawbench, planer, and spindle moulder, which has been designed for general builders' work. They are also exhibiting one of their latest Recessing, Grooving and Crosscutting Machines with swinging head, specially arranged for all classes of stair housing. This machine is self-contained with driving motor, and is fitted with a rising and falling table. A complete line of hand mortising machines, comprising side stroke and centre lever types, is also to be seen here.

At Stand No. 58 MESSRS. ETCHELLS, CONGDON & MUIR, LTD., of Mill Street,

The New "Rolador" Shutter: Details of Construction.
(E. Pollard & Co., Ltd.)
Stand No. 77.

Ancoats, Manchester, and of 25 Victoria Street, London, S.W.1, are showing an "E.C.M." Passenger Lift Car in grey sycamore with walnut inlay, together with lift indicators, door opening gear, and the "E.C.M." Standard Lift Controlling Gear in operation.

MESSRS. FARRELL & Co., LTD., of Sandford Road Works, Bexley Heath (Stand No. 30), are showing their "Autac" Door Check, which is actuated by a spring mechanism and, although made in only one size, is adjustable to suit either heavy or light doors. The "Ventex" Air Filter, a production of MESSRS. OZONAIR, LTD., of 96 Victoria Street, Westminster, S.W.1, is also exhibited at this Stand. This filter, which we illustrate, consists of an outer frame and an inner case holding metal plates of special section which are coated with a viscous liquid to which dirt and dust adheres during the passage of the air through the filter. These frames are 18 in. square, and are so arranged that a number of them can be bolted together to form a filter of any desired capacity. The accumulated dirt is periodically removed from the filter by cleansing the inner frame in hot soda water; the filtering media is then recoated with the dust-catching liquid and put into service as before.

The "Ventex" Air Filter.
(Ozonair, Ltd.)
Stand No. 30.

The New "Rolador" Shutter: Details of Construction.
(E. Pollard & Co., Ltd.)
Stand No. 77.

MESSRS. THE ECLIPSE RAIL TRACK LADDER CO., of 60 Upper Maudlin Street, Bristol (Stand No. 19), are showing a large assortment of extension ladders, rigid extension trestles, extension scaffold boards, folding tread lattice, and folding tables for paper-hangers. All these have improvements incorporated in their design and are well worth inspection.

Patent Telescopic Extension Ladders and Scaffold Trestles are also exhibited by MESSRS. THE ACME PATENT LADDER CO., of Summerly Street, London, S.W.18, at Stand No. 28.

Stand No. 27 is designed to show the constructional and decorative possibilities of Essex Board for ceilings, walls and partitions. The surface of this board, which is manufactured by MESSRS. THAMES BOARD MILLS, LTD., of Purfleet, Essex, is one of its pleasing features, for when treated with distemper or flat paint it gives an attractive matt finish. Essex Board is also an excellent non-conductor of heat and cold; it cuts and nails easily, and requires no preliminary treatment before decorating.

Models of spring dancing floors, parquetry and panelling comprise the exhibit of MESSRS. S. G. BRIERLEY, of 49 Deansgate, Manchester (Stand No. 7). Two spring floors are shown, one as used on a concrete bed, and one of the "suspended" pattern where space is limited and two springs are carried between the existing joists.

MESSRS. DREW, CLARK & Co., of "Diamond" Patent Ladder Works, Leyton, E.10 (Stand No. 15), are exhibiting a wide range of extension ladders, automatic folding platform steps, and other requisites for builders and decorators. They are also showing their patent "Rap-Rig" Scaffolding, which can be fitted with detachable wheeled legs to facilitate moving from one position to another.

Fire-fighting equipment, including a display of chemical hand fire extinguishers, is the chief feature at Stand No. 80, occupied by MESSRS. MINIMAX, LTD., of Feltham.

The "Dyke" Patent Door Unit, in deal, Columbian Pine and hardwoods, made by MESSRS. THE DOOR UNIT CO., LTD., of Park Royal, London, N.W.10, is being exhibited by Messrs. D. C. Williams, Ltd., of Smithdown Lane, Liverpool, at Stand No. 35. This door unit comprises a door hinged to its frame, completely fitted with mortice lock, furniture and one set of architraves, the other set tongued, grooved and mitred, ready for fixing as a complete unit. This door is built up with five or six boards with specially jointed edges, and is braced together with steel tubes passing edgewise through the boards. Provision has been made for keeping the tubes under tension. These doors are guaranteed not to shrink, warp or twist, and have been dropped cornerways 20 ft. without any rack or visible sign of disturbance beyond a bruised corner. In addition to ordinary

housing work, this door can be adapted to other requirements, lending itself to a variety of decorative treatments such as inlays, overlays, or compo ornament, whilst hardwood doors can now be supplied at a cost little in excess of a first-class deal door, by means of a special process of veneering. Conisborough Rustic facing bricks and "Pudlo" cement waterproofing powder is also shown at this Stand.

At Stands No. 12 and 13 MESSRS. THE DREADNOUGHT MANUFACTURING AND TRADING CO., LTD., of 1 Sickle Street, Manchester, special prominence is given to concrete mixers made by Stothert & Pitt, Ltd., of Bath—the Victoria H.M. Mixer (hand or power) and the "All-on" model complete with side loader and water tank, driven direct by a 2½ B.H.P. petrol engine, which is so balanced on the carriage that one man can wheel it.

The "Chaudoir" Patent Turn Lift for Garages.
(Wm. Wadsworth & Sons, Ltd.)
Stand No. 20.

The Light Smith Tilting Drum Mixer, with a batch capacity of 4½ cubic feet, is particularly adaptable for tramway and other works where space is limited, a tilting drum is preferred, or reversible direction of wheels is desirable. The "Lee Magnum" Concrete Block, Brick and Slab Machine for making solid or hollow rock-faced concrete products is another feature worth inspecting at this stand, where there is also a range of "Dreadnought" power hoists, winches and other lifting tackle.

At Stand No. 17 MESSRS. NAYLOR BROTHERS (LONDON), LTD., of Slough, Bucks, and of 46 Swan Street, Manchester, are showing their range of Varnishes, Paints, Enamels and Distempers. Prominent among the exhibits are two doors which are finished with Naylor Supermatt Flat Oil Paint and with "Suwena" White Enamel.

Another door shows Suwidee Varnish and Encaustic Copal Varnish, the former being applied over a light primrose, which is discoloured very little, the clean colour of the yellow still remaining pure despite the varnish coat on top. A new product, Brushing Belco, a cellulose lacquer which, it is claimed, can be applied to any wood or metal surface, needing no undercoat and no previous preparation, is also exhibited. This cellulose lacquer is manufactured by The Nobel Chemical Finishes, Ltd., who are associated with Messrs. Naylor Brothers, and can be supplied in ten standard colours.

MESSRS. HUTCHINSON & Co., of 1 North Parade, St. Mary's Parsonage, Manchester (Stand No. 44), are exhibiting "Bimol" Blocks for partition walls which are made from Moler earth; "Highpor" bricks and slabs for heat insulation purposes; "Vitrolite" panels, in a wide variety of colouring, for walls and ceilings; and oak flooring, only ¾ in. thick, which is therefore suitable for laying over existing floors.

A new General Purpose Machine for single and double tenoning, top and bottom scribing, cross-cutting and trenching, is exhibited by MESSRS. THOMAS ROBINSON & SONS, LTD., of Railway Works, Rochdale (Stand No. 39-40). In this machine the horizontal cutter spindles are set to give a slight undercut to the shoulders of the tenons, but the top spindle has a levelling adjustment to enable cross-cut saws, when used on this spindle, to cut vertically. Trenching can be carried out up to 24 in. wide, the cutter block on the top horizontal tenoning spindle being replaced by a plain or expanding trenching cutter block. By swivelling the fence, diagonal trenches can also be cut. The table is 48 in. long by 26 in. wide, and runs on dustproof rollers.

Stands No. 3 and 4 are devoted to a display of cleft chestnut pole fencing, cleft and sawn oak park paling, palisading and boarded fencing, and entrance gates in oak, chestnut and deal, made by MESSRS. THE FERNDEN FENCING CO., LTD., of Guildford, Surrey.

Stand No. 42, occupied by MESSRS. R. R. MINTON & Co., LTD., of Cheap-side, Liverpool, is finished with their "Glosopan" Gloss White Enamel and "Flatopan" Flat Oil Paint, the perfection of these specialities being demonstrated by the results obtained. A further illustration of the application of Flatopan Flat Oil Paint is demonstrated by a series of panels which are shown representing walls of rooms in different colour schemes. "Gransorbian Graining Paper," which enables the decorator to reproduce the natural grain of woods in a manner almost unobtainable by hand; specimens of the work done with this speciality in conjunction with their Gransorbian Scumble Stain are to be seen on a series of doors.

New Recessing Machine for Stair Strings.
(J. Sagar & Co. Ltd.)
Stand No. 61.

Amongst the modern woodworking machines exhibited by MESSRS. J. SAGAR & Co., LTD., of Canal Works, Halifax, at Stand No. 61, is a new Double Spindle Recessing Machine for Stair Strings, which we illustrate. In this machine adjustable stops are provided giving the correct spacing and widths of the treads and risers on the string board, and also on the slide frame for giving the "wedge room," the slide frame being swivelled right or left as required by the hand wheel at the front of the overhanging arm. When the various stops are adjusted for the string board required, no further setting out is necessary, a stop being adjusted to drop into the nosing of the first housing, which automatically spaces out the remaining housings in the stringer, the latter being moved forward longitudinally by hand against the table fence provided. The trenching cutter spindles revolve in roller and ball bearings, and are mounted in headstocks, which move along both sides of a right-angle slide frame, mounted on a bracket and swivelling from the overhanging arm of the machine. This special slide frame represents the run or track of the housings for the treads and risers in the stair stringboard. An adjustable fence is provided with swivelling adjustments in either direction, so that the string boards can be worked in varying gradients.

The "Marwell" Back-to-Back Grate.
(A. Wilkinson (Manchester) Ltd.)
Stands Nos. 82-83.

At Stand No. 59 MESSRS. SCAFFOLDING (G.T. BRITAIN), LTD., of 50 Bland Street, Moss Side, Manchester, whose Head Office is at 43 Lansdowne Road, London, S.W.8, are exhibiting the various types of safety scaffolding and scaffolding devices manufactured by this company. These exhibits comprise their patent Tubular Scaffolding, Heavy Suspended Scaffolding for use on steel frame buildings, and the "Scaffixer" Scaffold Ties for use with ropes in lieu of hemp or wire lashings. A section of "Conforms" Steel Shut-tering for concrete retaining walls is also on view. The carrying out of scaffolding contracts is a branch of this company's business, and photographs of work in progress or of recent completion are to be seen at the Stand.

The "Marwell" Back to Back Type Living-room Grate and Scullery Cooker is the feature of Stand No. 83-83 occupied by MESSRS. A. WILKINSON (MANCHESTER), LTD., of 21 Charles Street, Princess Street, Manchester. This combination, which we illustrate, has the fire in the living-room, from which the flame and heat pass under the H.P. boiler at the back of the fire, direct to the bottom of the oven in the scullery, and is conducted up flues at the sides and over the top of the oven to the chimney outlet. A cheerful open fire, a roasting and baking oven with a spacious hotplate for boiling purposes, and an ample supply of hot water for domestic use, are thus provided from one grate. An "interior" can be substituted for the mantel register shown in our illustration, on the living-room side of this combined heating and cooking unit, if so desired; the mantel register can also be supplied with tiled side cheeks in place of iron panels.

MESSRS. JOHN FOWLER & Co. (LEEDS), LTD., of Leeds, (Stand No. 26), are showing the "Fowler" Hoisting Mixer, which is a combination of their standard 6/4 concrete mixer with a hoisting winch for lifting the mixed concrete to any desired point. An extra large engine is fitted to this machine to provide ample power for carrying on the mixing operation continuously, and to be able to do hoisting at the same time, whilst the framework is reinforced to take the extra stresses incurred. They are also exhibiting the "Fowler" 4/3 Tilting Drum Mixer, which brings the advantages of mechanical mixing within the reach of the smallest user. In this unit, as in the larger machine, the drum is built up of two metals—a steel plate cone to reduce weight and a cast semi-steel base to withstand wear and tear. The patent arch on the bottom of the drum is claimed to prevent "balling" or clogging, and since the drum bottom is free from obstruction a clean discharge is ensured. The pitch of the mixing blades has also been designed to create the maximum amount of agitation, and their efficiency in this respect can be gauged by the fact that this mixer has been found equally serviceable for mixing skimming plaster as well as for the usual concrete aggregates.

At Stand No. 75, MESSRS. THE MIDLAND SAW AND TOOL CO., LTD.,

The "Marwell" Back-to-Back Grate.
(A. Wilkinson (Manchester) Ltd.)
Stands Nos. 82-83.

of Summer Lane, Birmingham, are demonstrating the "Midsaw" Universal Woodworker under belt. This machine will do the work of a saw-bench, planer and thickener, moulding, morticing, boring, tenoning, and grinding, besides which attachments can be added for dovetailing, turning and corner locking. Its compactness enables it to be carried to the job in cases where this course is warranted, and its many capacities are fully described in an illustrated booklet to be obtained at this stand, where a spindle moulder, a 32-in. sawbench, and a combined planer are also on show.

At Stands No. 65 and 66 MESSRS. THOMAS HUDSON'S EXORS., LTD., of 59-69 Shudehill, Manchester, are showing their "L. & G." Sunk Pattern Patent Fire and the "Triplex" Range, both in use. In the former the air necessary for combustion is controlled by means of a valve, and the fire may be maintained to give any desired degree of heat from an almost dormant smouldering to the fiercest glow. At this Stand there is also an attractive display of tile fireplaces, wood mantels, sanitary ware, and builders' ironmongery.

A variety of floorings, including composition flooring, terrazzo, wood block, parquet, cork and rubber, is displayed by MESSRS. THE RELIANCE FLOORING Co., of 114 Hemmings Road, Longsight, Manchester, at Stand No. 46.

The New "Liner" Kerb-making Machine.
(The Liner Concrete Machinery Co.)
Stands Nos. 5-6.

GROUND FLOOR PLAN

HOUSE AT CHISLEHURST, KENT. GEOFFREY P. MULLINS, A.R.I.B.A., Architect

HOUSE AT CHISLEHURST, KENT. GEOFFREY P. MULLINS, A.R.I.B.A., Architect.

Professional Societies

South Wales Institute of Architects

Sir Clement Kinloch-Cooke, Bart., M.P., speaking recently at the annual Dinner of the South Wales Institute of Architects on the Architects' Registration Bill, which he is shortly to present in Parliament, made an important speech in which he said the widespread effort to ensure the qualifications for architectural practice found its zenith in the Architects' Registration Bill. The Bill would not interfere with anyone at present in bona fide practice as an architect. The formation of a Council for the Preservation of Rural England showed the necessity for creating and maintaining a body of competent architectural practitioners, to any of whom local authorities and other public bodies or individuals could turn for advice and assistance in carrying out town and regional planning schemes, thus securing the preservation of the countryside and the prevention of its spoliation by the eyesores now being erected in such large numbers. The main object of the Bill was ostensibly to protect the public. As in the legal, medical and teaching, to mention only a few of the professions, the public was protected against unqualified persons by means of registration having the authority of law, so by the Bill it was proposed to give the same protection in the case of architects. Accordingly, the Bill provided that any person desiring to practice as an architect would be required to furnish himself with credentials carrying with them statutory authority and showing that he had received the necessary preliminary training and passed the necessary examinations. The same machinery that gave protection to the public would also protect the qualified architect from the competition of the unqualified person. In those professions where a statutory registration obtained the position of members had been raised, while the public had not failed to show its appreciation by taking advantage of the guarantees afforded for its protection. In no case had anyone advocated a return to the *status quo ante*. It was strange to him that so useful and desirable a reform had been so long delayed. It was not, perhaps, generally known that this country was one of the few where architects were allowed to practice without a statutory qualification. In Canada, Australia and New Zealand a statutory qualification had long been insisted upon. The same was the case in the Transvaal, and would soon become law throughout the Union of South Africa. In some twenty States of America, in Italy, Spain, and even in Russia legislation existed of a similar kind. Similar proposals were under consideration for India and Palestine, while in France, Germany, and Hungary, Government diplomas were compulsory in the case of official architects. There could be no doubt that the indefinite character of the profession of architecture prevailing in this country, in which a person totally ignorant of the root principles governing art and construction had an equal right with the skilled expert to describe himself as an architect, had had a prejudicial effect, not alone on the public, but on the profession itself.

Sir Clement proposed the toast of "The Royal Institute of British Architects and the Allied Societies," to which Mr. E. Guy Dawber, F.S.A., president of the Royal Institute of British Architects, responded.

Major Harry Barnes, F.R.I.B.A., also responding, spoke on the advantages which Sir Clement Kinloch-Cooke's Bill would bring to architects, especially to those men who lived in localities where the smaller authorities lacked an appreciation of what could be done by the employment of competent architects.

Berkshire Society of Architects

The Seventh Annual Meeting of the Berkshire Society of Architects was held at Reading University

on March 23. The Society has a membership of 101, including honorary members. The prizes awarded by the Berks Archaeological Society for measured drawings were presented to Mr. J. W. Turner and Mr. R. P. Walden. The following officers were elected to serve during 1927:—Chairman: Mr. J. T. Saunders, F.R.I.B.A.; Vice-Chairman: Mr. J. G. T. West, F.R.I.B.A.; Hon. Librarian: Mr. H. Whiteman Rising, F.R.I.B.A.; Hon. Treasurer: Mr. W. R. Morris, F.R.I.B.A.; Hon. Auditors: Mr. A. S. Cox, L.R.I.B.A. and Mr. E. P. Morgan, L.R.I.B.A.; Hon. Secretaries: Mr. W. J. Freeman, A.R.I.B.A., and Mr. E. Steward Smith, A.R.I.B.A.; Four Members: Mr. W. Roland Howell, F.R.I.B.A., Mr. Harry Hutt, F.R.I.B.A., Mr. C. B. Willcocks, F.R.I.B.A., and Mr. S. E. Burrett. Seven representatives of the Berkshire Society of Architects on the Council of the B.B. & O.A.A.: Mr. W. Roland Howell, F.R.I.B.A. (Reading), Mr. Harry Hutt, F.R.I.B.A. (Reading), Mr. H. Whiteman Rising, F.R.I.B.A. (Reading), Mr. C. B. Willcocks, F.R.I.B.A. (Reading), Mr. E. P. Warren, F.R.I.B.A. (Cholsey), Mr. J. G. T. West, F.R.I.B.A. (Abingdon), and Mr. E. Steward Smith, A.R.I.B.A. (Reading). After the meeting a lecture (an epitome of which we give on page 562) was given by Mr. Oswald P. Milne, F.R.I.B.A., on "Architecture in Modern Life."

Devon and Exeter Architectural Society

The annual meeting of the Society, which is in alliance with the Royal Institute of British Architects, was held recently at Exeter. The chair was taken by the President, Mr. E. F. Hooper, L.R.I.B.A., of Exeter. After the annual reports and balance-sheets of the Society had been unanimously adopted, the prizes for the annual measured drawings competition were awarded to Mr. F. Podesta Harrison (Plymouth) and Mr. F. S. Stillwell (Plymouth). Mr. E. F. Hooper, L.R.I.B.A., then delivered his address in the course of which he mentioned that the registration of Architects Bill, which is to be presented before Parliament next month, was a measure of very great importance to all architects, and there was no possible doubt that the measure, if passed, would be of inestimable value and benefit to the public and to the civic life of the country in general. In conclusion, the President mentioned the growing concern of the public at the spoliation of the country-side by ugly and unsuitable buildings.

The following Officers and Council were elected for the ensuing year:—President, A. C. Norman, F.R.I.B.A. (Plymouth); Vice-Presidents, R. M. Challice (Exeter) and W. A. Vercoc, A.R.I.B.A. (Plymouth); Past Presidents, J. L. Fottracre, F.R.I.B.A. (Plymouth) and E. F. Hooper, L.R.I.B.A. (Exeter); Hon. Treasurer, S. Dobell (Exeter); Hon. Auditor, L. F. Tonar, L.R.I.B.A. (Exeter); Hon. Secretary, J. Challice, A.R.I.B.A. (Exeter); Members of Council—Fellows: P. Morris, F.R.I.B.A., J. Bennett, L.R.I.B.A., W. J. M. Thomasson, A.R.I.B.A., O. Ralling, L.R.I.B.A., E. Jenkin, L.R.I.B.A. (Exeter), J. C. Beare, A.R.I.B.A. (Newton Abbot), Chas. Cheverton, F.R.I.B.A., A. S. Parker, F.R.I.B.A., B. Priestley Shires, F.R.I.B.A., W. H. May, F.R.I.B.A., H. Victor Prigg, A.M.I.C.E. (Plymouth); Associate Members of Council, D. W. Cooper (Exeter) and A. T. Martindale, L.R.I.B.A. (Plymouth).

South Wales Institute of Architects

At the annual general meeting of the South Wales Institute of Architects, held on the 17th inst., the following officers were elected: President, Mr. C. S. Thomas, F.R.I.B.A., of Swansea; Vice-Presidents, Mr. C. F. Ward, F.R.I.B.A., and Mr. T. Alwyn Lloyd, F.R.I.B.A.; Hon. Treasurer, Mr. H. Teather, F.R.I.B.A.; Hon. Auditor, Mr. J. Herbert Jones, F.R.I.B.A.; Hon. Librarian, Mr. R. H. Winder, A.R.I.B.A.; Hon. Secretary, Mr. Ivor P. Jones, A.R.I.B.A.

THE 7TH AVENUE FRONT OF MACY'S, SHOWING THE NEW TALL BLOCK AND THE OLDER BUILDING (to the right of the picture).
ROBERT D. KOHN and ASSOCIATES, Architects.

AN AMERICAN DEPARTMENTAL STORE

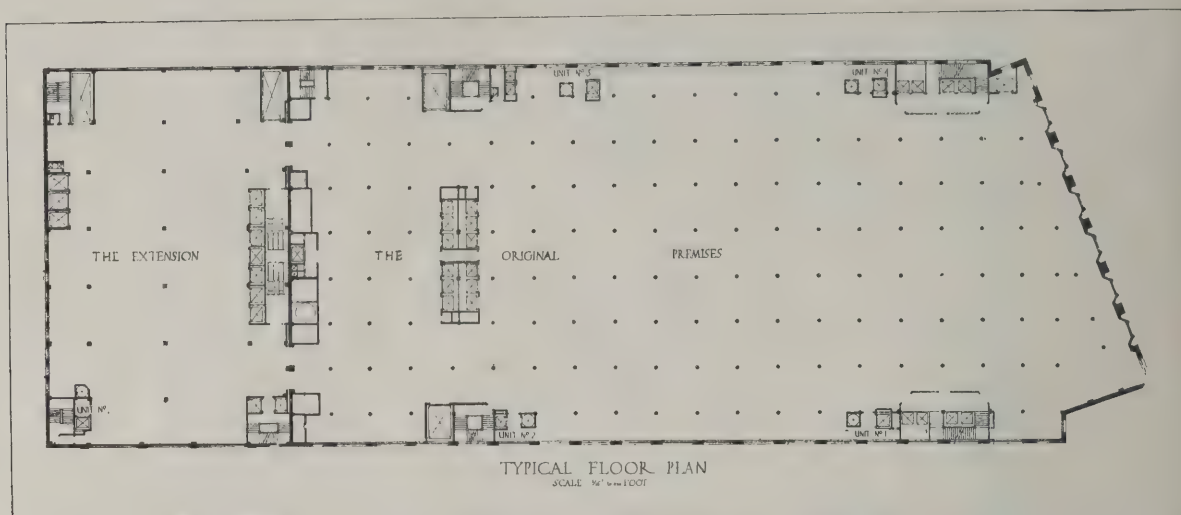

Macy's, New York.

By HOWARD ROBERTSON, F.R.I.B.A., S.A.D.G.

Progress and change in the design of the large department store in America have been exemplified more in detail and equipment than in the adoption of any fresh principles of lay-out. There is still a certain difference in New York, as there is in London, between the *de luxe* department store and the popular store, but in the former type there is less separation between departments than one finds in a first-class London shop, such as, for instance, Debenham & Freebody. The adoption of the big open space, without division walls, is common to both types, but the arrangement of goods and the general atmosphere of the expensive shop differs from that of the cheaper shop in the same way as does its shop windows; in the one case a reduction of show space and substantial piers, as at Lord & Taylor's, and on the other extreme the all glass treatment with the piers behind the glass face, as at Bonwit Teller's.

Macy's shop, in Broadway, between 34th and 35th Street, lies midway between the two poles. It is a cash store, with no charge accounts (though it operates a banking system for its customers, by which it pays 2 per cent. each year on all purchases made at the store), and it attracts a good class of customer, though not quite the same clientèle as the more expensive shops on Fifth Avenue.

The original building was erected 22 years ago, and in 1923 was added to by the addition of a very modernly equipped block at the rear. The new section and the old can be clearly distinguished on the plan by the difference in spacing of the column centres. In the old building the cast-iron columns are on 22 ft. x 24 ft. centres, and in the new portion the span is increased with steel stanchions to spans of 30 ft. x 40 ft.

MACY'S NEW BUILDING, NEW YORK: TYPICAL FLOOR PLAN.
ROBERT D. KOHN AND ASSOCIATES, Architects.

The system of floor construction is the cantilever type; in this method there are floor beams and a floor slab, but the beams are to each side of the pier instead of directly over it, thus reducing the span of the infilling between the beams, which takes the form of a 5-in. cinder concrete slab, the cinders being entirely from anthracite coal and, of course, very carefully washed. This method leaves two faces of the stanchion free as a surface against which pipes, etc., can be run, but the main advantage is allowing, with the wide spans of the stanchions, an extremely light floor slab.

The most practical floor height for the shop has been found to be 15 feet floor to floor, though in Macy's there is a specially high basement constructed to take ducts, cash tubes, etc. Very often, particularly in hotels, a special mezzanine floor, about 6 ft. or 8 ft. high, is arranged to take all such equipment, in lieu of arranging it in the basement, as is the general practice in England.

Apart from wider spans, the chief innovation in the new portion of Macy's is the installation of escalators, in addition to elevator service. Most of the traffic in the new shop arrives through the doorways into the old shop, and between these doors lie the up and down escalators, in each case the travel being continuous from floor to floor, *i.e.*, the point of arrival at any floor is adjacent to the point of departure for the next floor. It has been ascertained by calculation at Macy's that the escalator has a lifting capacity equal to about twenty-eight times that of one elevator. About 280 people per hour are taken in an elevator, and about 7,200 persons travel during a busy hour in a single-file escalator, and it has been found that the use of escalators has enormously increased the traffic towards the upper floors of the shop, proving an attraction to the customer. The escalator "cage" is totally enclosed, and can be shut off in the same way as a staircase.

As regards vertical traffic in a store of this kind, it has been found that the best method of arranging elevators is to disperse them at various points, and use them for long hauls, and the escalator for short trips. All elevators are fitted with micro-levellers, which ensure that they stop at an even level with the floor.

It will be seen that there are two large elevators for merchandise. These serve all floors, and are 28 ft. long, sufficient to accommodate a motor truck. Recent elevators are being made 31 ft. long, and some of the latest motor trucks are designed so that the truck body can be slid into the elevator while the chassis remains in the basement, thus economising on haulage of dead weight.

The basement of Macy's receives the incoming merchandise, and trucks from the street level are taken down to the basement, in which are the assorting bins for distributing merchandise, and in which, together with a sub-basement, there is space for ninety vehicles. Most of these are electric, and there is a special charging station, enabling the truck batteries to be charged while the bodies are being loaded. Special floor and ceiling level ventilation is provided in these basements on account of the presence of deleterious gases from the batteries.

The basement generally serves for reception and despatch of goods. For despatch there are a series of parcel chutes, which lead from the various floors to the basement, and on the ground floor, which is the most active selling department, there are rows of goods counters between the counters from which the public is served, and from these goods counters a series of chutes discharge on to an endless chain which is kept running below the floor, *i.e.*, on the basement ceiling. This belt passes a series of baffles, which catch the parcels and distribute them into various bins for despatch. The parcels are made up on the various floors by employees specially detailed to this work. The gangways for the public between the counters on the ground floor average 8 feet wide.

In the basement also are, of course, the power plants for the building. Macy's make their own electricity and find this an economy. In their new building oil fuel is used for the heating; the cubical contents of this building is approximately the same as that of the earlier portion, which requires with coal fuel eleven boilers and thirty stokers. In the new portion there is one less boiler and only two stokers are required for the oil burners, and it is reckoned that the annual saving effected has been as much as £6,000 per annum.

An incinerating plant is provided for burning rubbish; it is on the "economiser" principle, *i.e.*, the process of burning is utilised to pre-heat the water used in the oil-heated boilers, and raises it from the normal 60 degrees to very nearly boiling point.

Perhaps the most interesting feature of a store of this size is the enormous number of services which are required to support the actual selling area, and the vast number of employees to be catered for.

The restaurant service, for instance, has to cater for feeding 6,000 employees and about 2,000 guests. The arrangement for employees is a very up-to-date version of the "cafeteria" system—self-service—with four restaurants capable of holding 250 persons. Meal time for employees starts at eleven o'clock in the morning, and there are six shifts. The customer,

on entering the restaurant, provides himself with a tray, cutlery, napkin, etc., from a supply placed immediately inside the door; he then passes down the length of a long counter on which are placed all the dishes on the menu, with prices clearly marked, and makes a selection, which he places on his tray. There is a special track at counter level along which the tray can be slid while the selection is being made, thus avoiding the risk of spilling liquids, etc. At the end of the run an employee checks over the contents of the tray, and the adjoining cashier clerk receives payment. It is a very rapid and satisfactory service, and obviates all waiting and unnecessary delays.

There are sixteen floors in the new portion of Macy's, on the top three of which are located the main merchandise reserves which replenish the shop below. These reserves are zoned according to the various selling departments, with which they are connected by triple spiral chutes. There is a further reserve on the 10th and 11th floors of large goods in stacks, the merchandise being delivered here by electric trucks which are brought up in the elevators. All the goods are housed on steel shelving specially designed to meet the needs of different categories.

In addition to goods reserves, the 16th floor contains the training and research departments. The 15th floor contains offices for buyers, with private interview rooms, clerical offices, etc. The latter are all provided with acoustical ceilings, a similar equipment being installed in the administration offices on the 12th floor. The general scheme is to use a thick acoustical felt, from 1 in. to 2 in., covered with coarse muslin or perforated oilcloth. Celotex fibre board is used throughout in the telephone exchange rooms for the same purpose of sound deadening.

The 14th floor contains the advertising staff, the 13th the general offices and accounting department, the 12th the controller's department, and, apart from the already mentioned goods reserves, the remaining floors down to the 8th and 9th contain rest and recreation rooms, the vast public restaurant with its external terrace, the carpenter's shop, painting and repairs works, and the first aid and hospital department. This latter is finely equipped; there are seven nurses in attendance, able to look after fifty patients per day, and there are two outside nurses employed in travelling by automobile to visit employees who are ill in their own homes.

Naturally the finish and equipment of the various sections of such a building as Macy's varies according to its designation, the floors being a case in point. In the hospital department, for instance, they are finished in a rather resilient composition; in the goods reserves they are in grano; on the stair treads grano is mixed with carborundum, while rubber carpet and Travertine are both satisfactory for the public spaces, as is also a cloisonné terrazzo of squares of two or three feet separated by narrow strips of copper.

There is probably very little to be learned from the American store in respect of the various services and departments required for a vast selling organisation. But the readiness with which the American business man discards any appliance or method which is out of date or cumbersome, is generally a guarantee that American equipment will be found to be of the most modern and efficient pattern, and well worth the expense of a visit for those interested in equipping similar classes of buildings in this country.

The 14th century crypt discovered towards the end of last year, which abuts on the City of London Church of All Hallows, Barking, is to be formally opened by the Prince of Wales on April 7, and is to form a memorial to the late Mr. G. S. Hoare, who devoted himself to the service of "Toc H."

Building News in Parliament

WESTMINSTER, Wednesday, March 30.

Objection has been taken by certain members of the Labour Party to the proposed use of Stancliffe stone for the repairing of the main building of the Houses of Parliament, and they are raising the question on the Civil and Revenue Departments estimates. The sum which the House of Commons is asked to sanction this year for the repairing work is £30,000, the first instalment of a sum of £1,062,350 which will have to be spent during the next 12 or 15 years.

The point made by the objectors is that the use of siliceous sandstone will prove inimical to the health of the workmen on the job, and they contend that Portland stone ought to be used. The Office of Works, however, take the view that Stancliffe stone is both the best and the most economical material for the special character of the repairing work that has to be done. If Portland stone were employed, the cost of the work would be nearly £4,000,000, as it would be necessary to re-face the whole building.

But for the illness of the Lord Chancellor, Lord Cave, the Government's Leasehold Reform Bill would probably have been presented to Parliament by this time and its provisions would have been generally known. It is hoped that even yet it may be possible to introduce it so that the measure can be read a first time before Easter. To pass from the greater to the lesser, the Bill which Mr. Scurr introduced some time ago for the purpose of preserving the London squares, by conferring certain safeguarding powers upon the London County Council and the Borough Councils, still awaits second reading. The attempts which have been made to get it through have been met so far by opposition, but this is the fate of most Bills introduced by private Members, and it remains to be seen whether the opposition will be persisted in.

The Minister of Health has rejected the proposal which was pressed upon him by Colonel Day, a Labour Member, that all property owners owning houses with a rateable value under £80 a year should be "licensed." The object of the proposer was that this would be a method of compelling such owners to keep their property in a sanitary condition and in good repair. Mr. Chamberlain refuses to consider the passing of legislation along such lines. He pointed out that local authorities have wide powers under existing legislation to secure the purposes aimed at, even to the extent of executing the necessary work themselves and recovering the cost from the owners.

The Minister of Health has reminded the House of the useful operations of the Small Dwellings Acquisition Act, reinforced by the Housing Act, 1925, in helping to solve the housing problem. The total number of houses in respect to which advances have been made under those Acts up to the end of 1926 was 71,150. About £33,000,000 has been sanctioned by the Ministry of Health as advances to local authorities under the Acts from 1919 till the present year. In addition, the London County Council has sanctioned or advanced over £2,800,000, while the Birmingham Corporation has advanced £1,760,000 under special powers.

Local authorities in the rural areas, it was announced in the Commons, are to be energised with a view to getting them to put the provisions of the Rural Housing Act into early operation. The reconditioning of rural houses, as a means of providing good homes for agricultural workers, is regarded as a hopeful means of achieving, at small cost, what the Labour Government proposed to do, by building new houses, at a high cost. Mr. Chamberlain is anxious that housing shall be stimulated in rural areas, *pari passu* with the progress that is being made in urban areas.

Decorative Details from Britannic House, Finsbury Circus, London—III

Decorative Details from Britannic House, Finsbury Circus, London—III

SIR EDWIN L. LUTYENS, R.A., Architect. E. R. BROADBENT, Sculptor.

London Building Notes

ACTON.—Extensions are to be effected to the buildings of the Acton Hospital in Gunnersbury Lane, W. It is proposed to build new wards for 41 beds, with appurtenant increases for nursing and domestic staff, the whole costing some £25,000. The plans have been prepared by Mr. E. C. P. Monson, F.R.I.B.A., Finsbury Pavement House, Moorgate, E.C.

BERMONDSEY.—Factory premises are being erected in Grimscott Street, Bermondsey, S.E.1, for Messrs. Lazenby's, Ltd. (branch of Messrs. Crosse & Blackwell, Ltd.). The builders are Messrs. Higgs & Hill, Ltd., Crown Works, South Lambeth Road, S.E., who are working to the plans of Messrs. Joseph, architects, 2 Paul's Bakehouse Court, Godliman Street, E.C.4.

BLOOMSBURY.—Funds are being raised by the Royal Academy of Dramatic Art for the rebuilding of its premises in Gower Street, W.C. The present buildings are leased until 1930, and it is proposed to expend £25,000 on new premises, which will include a bijou theatre, a large gymnasium, and adequate accommodation for staff and students.

CAMBERWELL.—The Royal Savoy School in Colyton Road, Camberwell, S.E., has been acquired by the Wilmot Estate Co., 28 Grove Vale, East Dulwich, S.E.22.

CHEAPSIDE.—Funds are being raised for the purpose of restoration and other works at the Church of St. Mary-le-Bow, in Cheapside, involving an expenditure of £10,000. The present restoration will be supervised by the diocesan architect, Mr. E. S. Underwood, F.R.I.B.A., 3 Queen Street, E.C.4.

CITY ROAD.—Approval has been given to plans which provide for the erection of a block of bank premises on the site of No. 227 City Road, E.C., for the Westminster Bank, Ltd. The architects, Messrs. Horace Cheston & Son, 3 Tudor Street, E.C.4, have designed a building of three floors.

CORNWALL ROAD.—A block of flats are to be erected for the Metropolitan Police Force on a site in Cornwall Road, S.E.1. To be six storeys high, the building will contain 96 flats. The builders are Messrs. R. & H. F. Higgs, Ltd., Station Works, Hinton Road, Herne Hill, S.E. The plans have been prepared by Mr. G. Mackenzie Trench, F.R.I.B.A., New Scotland Yard, Westminster, S.W.1, and the quantities by Messrs. Thurgood, Son & Chigney.

CRICKLEWOOD.—Work is in hand upon the erection of the new Cricklewood Telephone Exchange, which is to be built for the London Telephone Service to the plans of H.M. Office of Works, Storey's Gate, Westminster, S.W.1. The builders are Messrs. Harry Neal, Ltd., Northwood, Middlesex. The chief architect to H.M. Office of Works is Mr. R. J. Allison, F.R.I.B.A.

CROYDON.—Operations are to be commenced upon the site of the proposed additions, which include a new nurses' home with recreation and dining rooms, at the Croydon Mental Hospital. Plans have been prepared

by Mr. H. Carter Pegg, F.R.I.B.A., 35 Parliament Street, Westminster, S.W.1, for a building costing £22,000, and providing accommodation for about 60 nurses.

CROYDON.—An hotel is to be erected at Waddon, by Messrs. Barclay, Perkins & Co., Ltd., to the plans prepared by the company's architects. The new building will contain extensive residential accommodation, and will cost £50,000 to build and equip.

DENMARK HILL.—The Salvation Army propose to build a training college for officers on a site of seven acres on Denmark Hill, S.E. The plans have been prepared by Mr. Alexander Gordon, 97 Queen Victoria Street, E.C.4, and Mr. G. J. Morris Viner, 23 Knightbridge Street, E.C.4, in consultation with Sir Giles Gilbert Scott, 7 Gray's Inn Square, W.C.

EARL'S COURT.—It is hoped to put in hand the first section of the new Kensington, Fulham and Chelsea Hospital, at the site on the corner of Richmond Road and Finborough Road, S.W. A large, completely equipped hospital, to cost £100,000, is planned, the architects being Sir Aston Webb, P.P.R.A., and Mr. Maurice Webb, F.R.I.B.A., 19 Queen Anne's Gate, Westminster, S.W.1.

EAST SMITHFIELD.—A warehouse of three floors is to be erected at East Smithfield, E.C., by the London and North Eastern Railway Company. The plans will be prepared under the direction of Mr. C. J. Brown, C.B.E., chief engineer, King's Cross Station, N.W.1.

FENCHURCH STREET.—A block of City offices is to be erected on the corner site in Fenchurch Street and Mincing Lane, E.C. The architects are Messrs. J. Campbell Jones Son & Smithers, 9 Dowgate Hill, Cannon Street, E.C.4. The builders are Messrs. Trollope & Colls, Ltd., 5 Coleman Street, E.C.2.

ISLINGTON.—Plans have been approved for alterations and additions, involving the partial rebuilding of part of the premises in Upper Street, Islington, N.1, owned by the London Co-operative Society, Ltd. The plans have been prepared by the Society's architects, Messrs. North, Robin & Wildson, F. & A.R.I.B.A., 35-39 Maddox Street, W.1.

KENTISH TOWN.—The shops and showrooms in Kentish Town Road, N.W., owned by Messrs. C. & A. Daniels, Ltd., drapers, are to be entirely rebuilt and modern drapery stores erected. The plans have been prepared by Messrs. T. Jay Evans & Son, 1 Newton Street, W.C., the builders being Messrs. George Parker & Son, Ltd., 124 Sumner Road, Peckham, S.E.15.

LEICESTER SQUARE.—The demolition of the old Empire Theatre is now completed. Messrs. T. D. Huntington, Ltd., Broadway Chambers, Hammersmith, W., are the builders. The new cinema to be erected will be designed to accommodate 3,500 seats, at a cost of £750,000. The associated architects are Messrs. Frank Matcham & Co., 9 Warwick Court, Holborn, W.C., and Mr. Thomas Lamb, of New York. The

consulting engineer is Mr. S. W. Budd, A.M.Inst.C.E.

LEWISHAM.—A reconstruction and enlargement of the Prince of Wales Cinema in Lewisham High Street, S.E.13, is proposed by the proprietor, Mr. J. Rayman. Plans have been prepared for alternative schemes, the architect being Mr. J. Stanley Beard, 101 Baker Street, W.1.

NEWGATE STREET.—Old buildings at the corner of Newgate Street and Ivy Lane, E.C.1, have been demolished to make way for a block of office and warehouse property shortly to be erected. The building will be of six floors, and has been designed by Messrs. Trehearne & Norman, Windsor House, Kingsway, W.C. The builders are Messrs. Griggs & Son, 100 Victoria Street, Westminster, S.W.1. The demolition contractors are Messrs. B. Goodman, Ltd., Haggerston Road, E.

PARK LANE.—Preliminary operations have been started on the well-known Grosvenor House site in Park Lane and Park Street, W.1, where development plans show a new 50-ft. roadway flanked by two large blocks of residential flats. The contractors are Messrs. Edcaster, Ltd., Vinnery Works, Goldhawk Road, W., builders of the new Mayfair Hotel on the Devonshire House site. The architects are Messrs. Wimperis, Simpson & Guthrie, 60 South Molton Street, W.1.

PICCADILLY.—The well-known property, the Burlington Arcade, in Piccadilly, and Burlington Gardens, W.1, has been acquired by the London Freehold and Leasehold Property Co., Ltd., 12 Norfolk Street, Strand, W.C.2.

SOUTHWARK BRIDGE.—Approval having now been given to the plans of the Vintners' Company for the nine-storey warehouse in Queen Street, E.C., work has been commenced by the contractors, Messrs. W. H. Larden & Son, Ltd., 107 Trinity Road, Wandsworth, S.W. The building has been designed by Messrs. Kersey, Gale & Spooner, 91 Moorgate, E.C.2.

ST. JAMES'S PLACE.—It is proposed, in connection with the opening of the new Ladies' Navy & Army Club, at Spenser House, St. James's Place, S.W.1, to build a residential wing at the rear of the property to accommodate some 30-40 bedrooms. Plans have been prepared by Messrs. Forbes & Tate, 97 Jermyn Street, S.W.1.

STRATFORD.—A site in Stratford's main street, the Broadway, E.15, has been secured by the Popular Cinemas, Ltd., who are to build a new theatre in the district. The architect is Mr. George Coles, F.R.I.B.A., 40 Craven Street, Strand, W.C.2.

WOOLWICH ROAD.—The Greenwich B.G. propose to add to their Greenwich and Deptford Hospital in Woolwich Road, S.E., a new operating theatre, for which plans have been prepared by Messrs. William A. Pite, Son & Fairweather, 12 Carteret Street, Queen Anne's Gate, S.W.1. Quantities have been prepared by Mr. Louis Jacob, F.S.I., 58 Gordon Square, W.C.1. Work is about to be commenced.

unure," at Purley,
home of J. B.
ight, Esq., O.B.E., is
charming house de-
signed by Messrs. Percy
Boddy, F.R.I.B.A.,
John A. Dempster,
R.I.B.A. The house was
built by Mr. Stafford H.
mer, of West Croydon.
The rendered surfaces are
"Atlas White" Port-
land cement stucco, the
textural effect having
been obtained by the use
of a wire brush. The
general trend of work
in renderings of white
Portland Cement concrete
concrete that possesses
full tensile strength
and lasting properties of
orthodox true Port-
land cement concrete—is
a hard brushed surface
or surfaces treated with
a carpet-covered float.
Plasterers are learning
that the neat cement skin
which in the early days
of concrete renderings was
allowed to cover the

aggregate, is productive of cracking and crazing. Architects are daily saving time and trouble by specifying proper textural finishes. My "Atlas White Stucco Specifications" are of great assistance in this connection. As many copies as may be required may be had from me. Write to Regent House, Regent Street, London, W.1. Plasterers or contractors are

just as welcome to them as are architects and surveyors. Anyone interested in white concrete may have a copy for the asking. We issue illustrated handbooks dealing with half-a-dozen uses of white Portland cement concrete. "Atlas White for Mortar" is a notable one. Before specifying the pointing and setting of brick or stone, write for a copy. It costs nothing. It points the way to beautiful effects and its illustrations of brickwork pointed in different colours are unique.

Frederic Coleman

The Week's Building News

The following abbreviations are used: U.D.C. for Urban District Council; T.C. for Town Council; R.D.C. for Rural District Council; E.C. for Education Committee; B.G. for Board of Guardians; P.C. for Parish Council; B.C. for Borough Council; M.H. for Ministry of Health; M.T. for Ministry of Transport; C.B. for County Borough; B.E. for Board of Education. Direct confirmation should be obtained before commitments, for which we cannot be responsible, are made.

ABERDEEN.—Plans for the erection of 45 houses and for the alteration to existing property in Aberdeen, at a cost of £70,080, were recently passed at a meeting of the Plans Committee of the Aberdeen T.C.

ABERYSTWYTH.—The T.C. propose to carry out improvements in Mill Street.

AYLESBURY.—The Ministry of Transport has approved a scheme for the erection of cement works at Pitstone. Level crossings over the Upper and Lower Icknield Ways are to be built to facilitate railway traffic. The promoters are the Associated Engineering and Finance, Ltd., London.

BALLISODARE.—The Sligo C.C. have approved the borrowing, by the County Board of Health, of £10,000 for a housing scheme at Ballisodare.

BASINGSTOKE.—The Corporation Housing Committee are to erect 126 houses on the Hackwood Road estate, and tenders are now being invited.

BECONTREE.—The L.C.C. recommend that, subject to the consent of the M.H., a site at Becontree, having an area of about 88,000 square ft. and a frontage of about 632 ft. to Becontree Avenue, be let on lease to Mr. W. White for the erection, within two and a half years, of about 30 shops.

BIDDULPH.—The U.D.C. are to erect 50 more houses on the Station Road housing site, subject to the approval of the M.H.

BOLSOVER.—The Bolsover Urban Council have received sanction to borrow £12,800 for the erection of 30 houses on the Waley Thornes housing site.

BRAMPTON ESTATE.—The report of a meeting of the Housing Committee recommended application to the M.H. for sanction to borrow £30,500, repayable in 60 years, for cost of Pickford Road (Brampton Estate) housing site (£4,000), cost of erection of 50 "Nash" bungalows (£14,300), internal sewers (£1,720), road making (£9,800), and borrowing costs (£590). It was also recommended to apply for sanction for a loan of £2,018, repayable in 30 years, for cost of outfall sewers. The committee mentioned that the 50 "Nash" houses on the site would be erected in such positions that the frontages in Long Lane and Pickford Road would be left for the erection in the future of houses of other types if this was desired. Another recommendation of the committee was: That the surveyor be instructed to proceed to arrange for the erection by direct labour of six "Nash" bungalows and with the preparation of plans, specifications, and general conditions and form of tender for the erection of 64 additional bungalows by contract, and invite tenders accordingly.

BRIGHTON.—Brighton station is to be reconstructed by the Southern Railway at a cost of roughly £90,000. The existing booking-hall is to be enlarged, and an additional exit from

the station will be provided by means of steps and a subway. The refreshment rooms will be extended, their lighting improved, and a scheme of decoration adopted for the interior treatment. There will be a new enquiry office and improved waiting-room accommodation. Work will be started immediately.

BRUTON.—The Governors of King's School, Bruton, Somerset, are inviting tenders for the erection of a sanatorium according to plans prepared by the architects, Messrs. Pictor & Hinton, of Bath.

CAMBORNE.—Work is shortly to be commenced on the erection of 50 houses which are to be erected by the U.D.C. to plans prepared by Mr. E. S. Haslett, architect.

CHARLTON.—Developments are promised in connection with the Charlton Park housing estate. Messrs. Thomas & Edge, the contractors building the 202 houses on the Twenty Acre Field, are to be approached with a view to their submitting a price for the erection of 80 further houses on the Charlton Park site, and the disposition of other land has been receiving the consideration of the committee.

CHATHAM.—The Chatham Corporation will shortly be inviting tenders for constructing a further 11 miles of sewers in the borough. This will complete the 38 miles of sewers of the main drainage scheme prepared by W. H. Radford & Son, Civil Engineers, Nottingham.

DOWNHAM.—A further section of the Downham housing estate of the L.C.C.—the Verdant Lane section—is to be developed at an estimated expenditure of £810,000. The Housing Committee of the Council, in recommending that approval be given to this estimate, report that the lay-out plan for the section shows 1,266 houses and flats (4,705 rooms). A site has been allocated for an elementary school, and a further site reserved for leasing for the erection of a licensed refreshment house.

EASTBOURNE.—A new library is to be built in the East End of Eastbourne.

GLAMORGAN.—In connection with the Glamorgan County Council schools scheme, the erection of a new school at Rhiwbina will be proceeded with immediately. The estimated cost is £16,350. The work on the new school at Beddau will be commenced next week. The contract price is £12,340. The building at Dolau, Llanharan, now in course of erection, will cost nearly £19,000, and that at Tiryrberth, which will be opened in about two months' time, will cost over £15,000. The intermediate school for boys, which is now being built at Neath, will cost £39,456, and the blind institution at Bridgend £29,309. The erection of the first of a series of mining institutes for the county has just been commenced at Caerphilly.

In this connection grants of approximately £5,500 will be received from the Miners' Welfare Fund in respect of each of five schools, the grant being according to the size of the contemplated building.

GRANGEMOUTH.—Grangemouth T.C. have agreed to complete their housing scheme by building 52 additional houses.

GRAVESEND.—The Corporation are to invite further tenders for 114 houses at King's Farm.

GUISELEY.—The Guiseley Urban Council have decided to build about 75 houses on the Hawkhill Estate housing site. Builders desirous of submitting plans, etc., may forward their names to Mr. M. Renard, Clerk to the Council, Guiseley, near Leeds.

HACKNEY.—The L.C.C. have approved preliminary plans embodying the proposals in regard to a central school and day open-air school on the Upton House Industrial School site.

HALIFAX.—A new branch library is to be erected in the Ovenden district by the Halifax E.C.

HONITON.—The Honiton Rural Council have received sanction from the M.H. to erect 82 houses in the district as follows: Branscombe, 6; Upottery, 4; Broadhembury, 4; Cotleigh, 2; Payhembury, 6; Dunkeswell, 4; Luppitt, 4; Feniton, 4; Talaton, 4; Yarcombe, 12; Monkton, 4; Southleigh, 4; Salcombe Regis, 12; Sidbury, 12. The Ministry have also approved the Council raising a loan of £1,400 for housing subsidies.

LEWISHAM.—The L.C.C. have decided that a school for about 896 children, and capable of enlargement by 128 places, should be provided at Downham (Lewisham, E.). They have approved preliminary plans of the proposed school.

LLANGOLLEN.—Eight houses are to be erected by the R.D.C.

MANSFIELD.—The Corporation are to erect 113 houses on the Ravensdale estate.

MANSFIELD.—Mansfield T.C. propose to build a new Town Hall and Municipal Offices at a cost of £80,000.

MARBLE ARCH.—A cinema capable of seating 3,000 people, with restaurant and dancing accommodation, is to be erected at Marble Arch, adjoining Great Cumberland Place, London. Preparation of the site will commence almost immediately with the demolition of a number of houses.

MILE END.—A new elementary school is to be built by the L.C.C. at Mile End Road, and another at Bow.

MYNDDISLWYN.—A hundred and fourteen houses are to be erected on the Penllwyn site, Pontllanfraith, at a cost of £60,000. The architects are Messrs. A. F. Webb & W. A. Griffiths, Tredegar Chambers, Blackwood, and the contractors Messrs. J. E. Jones & Co., Pontllanfraith.

161 BOROUGH HIGH STREET, LONDON, S.E. 1

ROWLEY.—The Regis E.C. recently considered a plan for a school on land bought by the Urban Council on the Stile House and Church Farm estates at Rowley for housing purposes. The plan was approved.

SELSDON.—Messrs. Richard Costain & Sons are to build another 50 houses at Selsdon Garden Village, Surrey.

SOUTHWELL.—Southwell R.C. recently decided to apply for a further loan of £40,000 for subsidy houses.

SOUTH ELMSALL.—The annual parish meeting at South Elmsall has decided to ask for a loan for a fire station to serve the township and the adjoining village of South Kirkby. Plans have been approved, the estimated cost being £2,500.

STAINES.—Plans passed: House, Towing Path, Laleham, J. N. Wetherill; bungalow, Stanwell Moor, Stanwell, W. Spencer; house, Dawley Road, Harlington, W. J. Billingham; four cottages, Dawley Road, Harlington (subsidy), H. C. F. Frere; house, Kingston Road, Laleham, H. Caiger; pair of houses, Green Lane, Shepperton, W. A. Whitewright; pair of cottages, Cranford Village, A. C. Keen; pair of cottages, Feltham Hill Road, Ashford (subsidy), A. Dodsworth; six cottages, Arlington Road, Ashford (subsidy), A. G. Melsom; new road at Harlington, Field & Sons; and 24 houses, Hatch Lane, Harmondsworth, Lightwood Building Co.

ST. AUSTELL.—The Joint Isolation Hospital Board propose erecting a new isolation hospital at an estimated cost of £6,000.

SWANSEA.—Twelve houses are to be built in St. Iltyd's Crescent.

TORQUAY.—Plans have been prepared for alterations to a shop in the Strand, Torquay, for Messrs. J. Troulan & Sons, opticians. Mr. Lionel F. Vanstone, architect, Midland Bank Chambers, Paignton.

WALSALL.—A proposal will come before Walsall T.C. from the Housing Committee that tenders be entered into for erecting 203 houses on the Ida Road site, at a total cost of £83,221, and also for erecting 20 houses and 12 flats on the Four Crosses site at Leamore, at a total cost of £13,030. It is also proposed to submit drawings, for approval, of the lay-out of the necessary electricity mains, which will cost £8,600.

WALSALL.—The Rushall P.C. are to ask the Walsall R.D.C. to erect 40 more houses. The B.G. are to have plans prepared for the erection of a house for the medical officer to be appointed, at an estimated cost of £1,700.

WEATHERBY.—West Riding E.C. have voted £10,000 for the adaptation of premises at Weatherby for a middle school and the erection of an elementary school.

WHITECHAPEL.—The Whitechapel Pavilion has been sold, and is to be converted into a cinema.

WHITWOOD MERE.—West Riding E.C. have voted £7,500 for the erection of a school at Whitwood Mere.

WINCHESTER.—The Corporation Housing Committee, at the last meeting of the Council, requested to be permitted to prepare a scheme for the erection of 40 more houses. These are

for Stanmore, on Battery Hill. There are 40 new houses nearing completion at Bar End, and last month it was decided to erect 30 on St. Giles' Hill. The estimated cost of the Battery Hill houses is £21,000. The proposal was unanimously adopted.

WOOLWICH.—The L.C.C. recommend the borrowing by the Woolwich Metropolitan Borough Council of an amount not exceeding £30,000 for housing purposes within the borough.

Brixton School of Building

On Friday of last week the distribution of prizes and exhibition of students' work took place at the London County Council School of Building, Brixton.

After an address by the Chairman (Mr. H. D. Searles-Wood, F.R.I.B.A.), the Minister of Labour, Sir Arthur Steel - Maitland, congratulated the school on its splendid work during the past session, and distributed the medals, prizes and certificates.

The following is the list of medallists and prize-winners:—

Trade Classes (Evening).—W. J. Dickerson, 1st, £2 2s. and Institute of Builders' Silver Medal and City and Guilds of London Institute Silver Medal, Carpentry and Joinery; C. E. Hansson, 2nd, £1 1s. and Institute of Builders' Bronze Medal; L. A. Blake, College of Masons' Silver Medal and £2 2s.; A. Kerley, Associated Master Plumbers' Prize, £1 1s.; G. Faulkner, £1 1s., Brickwork; W. S. Taylor, £1 1s., Masonry; E. Snelling, £1 1s., Plumbing; B. O. Jay, 15s., Plastering; T. J. Hall, 15s., Plastering; L. C. Pinney, 15s., Plastering; A. Thomas, 10s. 6d., Painting; A. J. West, 10s. 6d., Painting.

General Building Classes (Evening).—H. Fulford, 1st, £3 and Silver Medal, City and Guilds of London Institute, and £1 1s., Builders' Quantities; W. E. Wakelin, 2nd, £2 10s. and Silver Medal, City and Guilds of London Institute, Builders' Quantities; F. S. Hockaday, 1st, equal £1 1s. and School of Building Silver Medal; R. G. Liptrap, 1st, equal £1 1s. and School of Building Silver Medal; E. Cordeiro, 2nd, £1 1s. and School of Building Bronze Medal; H. E. Greene, 1st, Builders' Estimating, £2 2s.; S. Hancock, Homework, £1 1s.; E. F. Parsons, £1 1s., Builders' Accountancy.

Architectural Classes (Evening).—D. W. Parsons, Sketch Club prize, £2 2s.

Senior Day Technical School.—Second year: J. Austin, 1st, £1 1s.; F. A. Rule, 2nd, 10s. 6d. First year: J. G. Goodall, 1st, £1 1s.; R. T. Lenton, 2nd, 10s. 6d.

Junior Day Technical School.—Third Year: H. G. Ede, 1st, £1 1s. and Institute of Builders' Silver Medal; E. J. Cook, 2nd (General Section), £1; W. Henderson, 2nd (Trades Section), £1. Second year: A. C. Layfield, 1st (General Section), 15s.; W. H. Coe, 1st (Trades Section), 15s. First year: J. H. Pearson, 1st, 15s.; C. D. Kendrick, 2nd, 10s.

National Painters' Competition, 1926.—J. Watson, 1st, £3 3s., Sketch Book Studies; 3rd, £1 10s. 6d., Coloured Drawings; Scott prize, £2.

B. H. E. Gates, 3rd, £1 10s. 6d., Sketch Book Studies. M. L. Clifton, 2nd, £1 1s., Set of Six Colour Schemes. C. D. Kenrick, 1st, £1 1s., Free Drawing. Decoration: L. C. Lewis, 1st, £25; H. White, £10 10s.; B. F. Dark, £10; J. Watson, 2nd, £7 10s.

Rural Councils Association.

At a recent meeting of Okehampton Rural Council a letter was received from the Rural District Councils Association with reference to the Housing Rural Workers Act, 1926, pointing out that under the Act Rural District Councils had no power after the 31st inst., unless they made application to the Minister of Health before that date asking to be the local authority for the purpose of the Act to the exclusion of the County Council. They urged that all Rural Councils should show the Minister of Health that they were able and willing to undertake all the responsibilities of the Act, and maintained that Rural Councils were the proper authority to look after their local affairs. The Chairman said he had been present at the conference of the Rural Councils Association, when 500 delegates present had been unanimous that the Rural Councils should be the authority for the Act. The Act stipulated that the County Councils should administer it, but there was a proviso that any district authority could make an application under special circumstances to be the authority to the exclusion of the County Council. It was resolved to make application for power under the Act, instead of the County Council.

Glasgow Building Strike

An Industrial Court is to consider the point in dispute in the Glasgow building strike. Work has been recently resumed. The labourers—a cut of 1½d. per hour in whose wages was the cause of the strike—go back at the old rate. The Industrial Court will be asked to give its opinion on the question: "Should the National Agreement apply to the building trade labourers affiliated to the National Federation of Building Trade Operatives who are employed by members of the Scottish Building Contractors Association in Glasgow and the West of Scotland?"

Welsh Subsidy Houses

Mr. Neville Chamberlain stated recently in the House of Commons that houses completed in connection with subsidy schemes in the following six Welsh counties since 1919 and up to March 1, 1927, were: Denbigh, 1,263; Flint, 38; Brecknock, 192; Carmarthen, 1,373; Glamorgan, 6,194; Monmouthshire, 3,609.

Builders' Apprentices

Recent official statistics show that there are over 11,000 apprentices at work on 60,000 houses now being built by contract or by direct labour in England and Wales, under schemes approved by the M.H.

The Hall Mark of Your Craftsmanship

TO maintain a high standard of quality in an installation and yet to keep the cost of accessories at fixed limits is a problem often confronting the Electrical Craftsman.

It is in this connection that the "Crabtree" 3-amp. (popularly known as the "Crabtree Junior"), can solve the problem of controlling small circuits (house lighting) where a 5-amp. and consequently more expensive Switch would ordinarily be used.

Although only 1 1/2" in dia., the "Crabtree Junior" has been proved to be capable of heavier loading than the majority of so-called 5-amp. Switches.

Supplied in Double-Pole or semi-recessed type and with mechanical parts practically identical with a 5-amp. Switch, it often obviates the necessity for fitting a cheap foreign-made "5-amp." (?) Switch.

Compact Craftsmanship by—

"Craftsmen
in Electrical
Switches."

Economics of Building

Mr. David M. Lawrance, B.Sc., recently read a Paper before the Auctioneers' and Estate Agents' Institute on "The Economics of the Land." Speaking under the heading of the economic rent of urban land, the lecturer said: In the case of land suitable for the erection of private dwelling-houses, situational advantage would take the form of such amenities as pleasant and healthy surroundings and quick and easy means of transport to shopping and business centres. There might be a considerable area of land in and around a town which was suitable for the erection of houses, but the land which possessed those amenities in the greatest degree, and for which there was therefore the greatest demand, would be necessarily limited in quantity. The effect of this limited supply would be that the price or rent paid for houses in that particular situation would rise to the maximum figure which those who coveted those amenities, and were able to pay for them, would be prepared to offer. Similar houses erected on land which did not possess those advantages in the same degree would not be the subject of such keen competition on the part of prospective occupiers, and would not command so high a figure.

In the case of land suitable for the erection of business premises of various types, the principal consideration was the profit to be derived from the occupation of suitable premises in the particular situation. The prospective occupier of shop premises on the principal shopping street of a city could afford to pay a higher rent than the occupier of shop premises in the suburbs, because the situation of the premises would enable the former to carry on his business at a much higher level of profit than the latter. It was true that some part of the difference in rental value might represent interest on the extra cost of more elaborate premises on the central site, but a large proportion would be due to situational advantage. To an even greater extent than in the case of land suitable for housing purposes, the supply of the most favourably situated land would be strictly limited, and demand would tend to force up the price until it had eliminated from competition all except those the nature of whose business enabled them to derive the maximum advantage from occupation of premises on the best sites. So they found the limited area of land at the financial centre of cities coveted by the banks, insurance offices and the most prosperous commercial undertakings. As a consequence the rents of office premises were at their maximum in that quarter, and after allowing a reasonable return on the cost of erecting elaborate and expensive buildings, the economic rent—the payment for the situational advantage of the site—would represent a large proportion of the annual value of land

and buildings combined. Other parts of the urban area would appeal to the big wholesale houses. Premises on the principal shopping streets would be occupied by retail traders with sufficient capital to carry on business on a large scale; those in the less important shopping centres by firms whose capital or enterprise was more limited.

In all these cases the estimated income from the type of building best suited to the position of the site—and consequently the economic rent of the land—would be governed by the anticipated profits of prospective occupiers, based on the advantages which the situation offered from a business point of view. An important factor in limiting the amount of accommodation available on the best sites was the tendency to diminishing returns in buildings—the fact that, apart from any question of building by-laws or engineering difficulties, buildings could not economically be carried to an indefinite height even in the most coveted situations. An exceptionally high building required, as a rule, an exceptionally heavy expenditure on walls and foundations, while the general cost of construction was increased by additional expense in such items as hoisting and scaffolding. Usually the upper storeys of such a building were less attractive to prospective tenants than the lower ones, so that the general tendency was for the rental values to decrease the higher one went in the building. As a result a point would sooner or later be reached beyond which the extra income to be expected from the addition of further storeys to the plan of the building would fail to show a reasonable return on the increased structural cost involved, so that it would pay the capitalist better to apply his money to developing the resources of less favourably situated sites. The tendency to diminishing returns did not, of course, operate with the same intensity in every type of building. It was probably strongest in the case of factories and warehouses, where the running expenses of raising goods and materials to the upper floors, and the increased cost of supervision and general organisation, soon made themselves felt above a certain height. It was least felt in the case of thoroughly well equipped offices and flats in particularly favourable situations. The latter point was strikingly illustrated by the fact, recorded in a recent Paper read before this Institute on the subject of Real Estate in America, that in the "sky-scrapers" of New York the upper floors not only let first, but actually command a higher rental on account of the increased light and quietude which they enjoyed as compared with the lower floors.

Westminster Bank

The Westminster Bank announces that Mr. Robert Hugh Tennant, Deputy Chairman, has been elected Chairman of the Bank, and that the Hon. Rupert E. Beckett has been elected to succeed him as a Deputy Chairman.

Happy Cardiff

The Cardiff Housing Committee recently decided not to make any further application to the M.H. for power to build houses of the present type. Instead, the city engineer was instructed to prepare a plan of a house of a much smaller type, which could be built and let at a much lower price.

The resolution followed upon a recommendation by the city treasurer that the time had arrived for the committee to consider whether it would not be wise either to retard or suspend municipal housing operations. He explained that there were 1,125 houses either in course of construction or to be built; while the net total of applicants was 865. Taking the whole of the schemes, the Corporation's total capital expenditure on housing would reach £2,097,800, while they would ultimately have provided 3,206 houses. He recommended that the Corporation in future should confine itself to the granting of subsidies and loans to private enterprise. With a margin of 440 houses, he urged that there would be ample room for prospective applicants, especially as there was an average of 21 houses vacated per month. They were rapidly approaching a position when they could say that under existing conditions they had cured the housing shortage.

Church Army Housing

Viscount Lascelles recently unveiled at Leeds the Church Army Houses commemorative shield. The houses, 12 in number, have been built in Clifton Grove, and the Church Army has made it a condition that nobody with less than four children shall be admitted as a tenant, and the income must not exceed £4 10s. a week. The houses consist of three bedrooms, bathroom, living-room, and scullery. The cost of each house is £650. For £300 subscribed the Church Army adds a similar sum, and the Government subsidy makes up the remainder.

Ottawa Carillon

Messrs. Gillett & Johnston, bell founders, Croydon, have completed within 18 months of beginning the work the largest carillon in the world. It will be shipped to Canada and, with an electric clock, will be placed in the tower of the Houses of Parliament at Ottawa. The carillon, which commemorates the peace of 1918 and the sacrifices of Canada in the war, consists of 53 bells, weighing as many tons, mounted in a steel framework weighing 22 tons. An inscription on the largest bell of 10 tons is in French and English, and round the top maple leaves have been moulded. This bell will be the second largest in Canada and the third largest on the American continent. The clock will control five of the bells for striking the Westminster Chimes. It is proposed to inaugurate the carillon with suitable ceremony on Dominion Day, July 1. At a private view of the bells recently, M. Kamiel Lefevre, principal assistant carillonneur at Malines, gave a recital.

WOOLMER GREEN.—April 11.—For the erection of 10 cottages. Mr. H. G. Cherry, 7 Buckingham Street, Adelphi, W.C.2. Deposit £3 3s.

REINFORCED CONCRETE ENGINEERS

The Kahn System

THE COALISLAND WATER AND SEWERAGE WORKS, IRELAND.

Engineer: J. H. H. SWINEY, M.Inst.C.E.

Contractors: COLLEN BROS.

The above illustration shows the pumping station and the filter beds which are constructed of reinforced concrete on the Kahn system. The entire scheme also includes reinforced concrete sewage tanks and raw water basins.

REINFORCED CONCRETE IS THE MOST ECONOMICAL METHOD OF CONSTRUCTION, IT IS PERMANENT AND FIREPROOF, AND IT ELIMINATES MAINTENANCE CHARGES.

With reinforced concrete structures the first cost is the last cost. There is no maintenance. Concrete does not require painting. It does not rust, dry rot, or perish. Its strength increases with age.

A large percentage of the labour required for reinforced concrete construction is semi-skilled and the necessary equipment comparatively simple — points having a considerable bearing on the total outlay.

THE TRUSSED CONCRETE STEEL CO. LTD.

22 Cranley Gardens, South Kensington, S.W.7

Building Tenders

BATH.—The Housing Committee has accepted the tender of The Housing Corporation of Great Britain, St. James's Square, London, for the erection of 148 houses at Southdown, Bath, at £71,165. Houses are of three kinds—parlour, non-parlour with three bedrooms, and non-parlour with two bedrooms.

BETHNAL GREEN.—The L.C.C. Housing Committee recommend the tender, £21,241, of Messrs. Rowley Bros., Ltd., Tottenham, for the erection of a block of 44 tenements in the Brady Street area, Bethnal Green.

BEXHILL.—The Corporation Highways Committee recommend the tender, £32,224, of Mr. Stephen Carey, for the widening of Barnhorn Lane.

BRIGHTON.—The Corporation have accepted the tender of Messrs. Packham, Sons & Palmer, Brighton, £1,148, for the erection of a foreman's house at Patcham Works.

BRIGHTON.—The Corporation Housing Committee have accepted the tender of Messrs. R. P. Davis & Co., Ltd., of Margate, for the erection of 60 houses on the Whitehawk Valley housing site at £28,500.

COLLINGWOOD ESTATE.—For the erection of Codrington House, the fourth block of dwellings to be erected on the Collingwood estate, Bethnal Green. The dwellings have been designed to contain 44 tenements with 132 rooms, to afford accommodation for 264 persons. Rowley Bros., Ltd., Tower Works, Tottenham, £21,286 (accepted subject to the consent of the M.H.); A. E. Symes, Stratford, E.15, £21,487; Leslie & Co., Ltd., Kennington Square, W.8, £21,523; A. T. Rowley, Tottenham, N.15, £21,561; J. E. Billings & Co., Ltd., 56 Victoria Street, S.W.1, £21,756; George Walker & Slater, Ltd., 58 Pall Mall, S.W.1, £21,940; William Simms, 591 Commercial Road, E.1, £21,965; E. D. Winn & Co., Ltd., 4 Halkin Place, S.W.1, £22,999; R. Woollaston & Co., 40 Turner's Road, E.3, £23,222; Canonbury Construction Co., Ltd., Canonbury Street, W.1, £23,698; R. J. Rowley, Tottenham, N.15, £23,956; A. Roberts & Co., Ltd., 74 Earl's Court Road, W.8, £24,350; Chessums, Ltd., Tottenham, N.15, £24,823; G. B. Farrar & Co., 193 Whitechapel Road, E.1, £24,868; S. E. Moss & Son, Southend-on-Sea, £26,668 12s. 6d.

COOMBS.—For the erection of 14 houses at Coombs for the East Stow R.D.C., Mr. Plummer, Bury St. Edmunds, £7,132.

KNEBWORTH.—Hitchin R.D.C. have accepted the tender of Mr. E. B. Meek, of Welwyn, for £11,500, for the erection of 26 cottages in Park Lane.

MERTON.—Surrey E.C. have accepted the tender, £12,872, of Messrs. Burges & Son, for the erection of an elementary school at Merton Abbey.

MERTON.—Surrey E.C. have accepted the tender of Messrs. Grace & Marsh, Croydon, £8,954, for the erection of a new science building at Rutlish School.

NEWTON ABBOT.—In connection with the Broadlands housing scheme the U.D.C. have accepted the tender of The Universal Housing Co., Ltd., for the erection of 54 houses, at £24,550; and that of Messrs. W. H. Smith & Son, Torquay, for the roads and sewers, at £3,045.

MIDDLESBROUGH.—The E.C. recently decided to accept the tender of Messrs. Stephen Easton, Ltd., Milburn House, Newcastle, amounting to £65,894, for a new technical college.

MIDDLESEX.—For work at the following schools, for the County Council of Middlesex, from plans prepared by Mr. H. G. Crothall, F.R.I.B.A., County Architect. Erection of new primary school, North Wembley: C. J. Newby & Bros., Southgate, £15,790 (recommended for acceptance); H. Knight & Son, Tottenham, £15,861; Y. J. Lovell & Son, Gerrards Cross, £15,958; W. Lawrence & Son, Ltd., London, E.C., £15,976; G. Bollom & Sons, Ltd., Acton, £15,977; W. Lacey, Hounslow, £16,130; G. Godson & Sons, Ltd., Kilburn, £16,217; Ferris Bros., Acton, £16,309; Perry Bros., Ealing, £16,769; W. Moss & Sons, Ltd., Cricklewood, £16,964 15s. 7d.; J. & J. Dean, Leyton, £17,065; Albert Monk, Lower Edmonton, £17,150; J. Dorey & Co., Ltd., Brentford, £17,270. Erection of new block, etc., at Whitehall School, Uxbridge: Y. J. Lovell & Son, Gerrards Cross, £11,474 (recommended for acceptance); Fassnidge & Son, Ltd., Uxbridge, £11,897; W. S. Try, Cowley, £11,906 16s.; Ferris Bros., Acton, £11,943; G. Bollom & Sons, Ltd., Acton, £12,227; H. Knight & Son, Tottenham, £12,234; W. Lawrence & Son, Ltd., London, E.C., £12,444; Perry Bros., Ealing, £12,451; W. Lacey, Hounslow, £12,587; G. Godson & Sons, Ltd., Kilburn, £12,990; W. Moss & Sons, Ltd., Cricklewood, £12,991 18s. 11d.

PLYMOUTH.—For erection of a new house, garage, etc., at Crownhill, near Plymouth, for Capt. Charles C. Cartwright; W. H. Hamley, Roborough, £1,795; Messrs. Solomon & Renny, Plymouth, £1,760; S. J. Moorman, Elburton, £1,687 (accepted). Plans prepared and building supervised by Lionel F. Vanstone, architect, 15 Old Town Street, Plymouth.

SEAFORD.—Official list of tenders received for cottage in Heathfield Road, Seaford. Messrs. Underdown & Duke, LL.S.A., architects, Lloyds Bank Chambers. Messrs. James Bodle, Ltd., £1,185; Mr. W. L. Killoran, £1,084 15s.; Messrs. The Ringmer Building Works, £1,064; Messrs. A. & H. Burgess, £994.

ST. ALBANS.—For the proposed erection of six houses at Frogmore, Mr. R. C. E. Ebbs, of Park Street, for £2,913 8s., was accepted. Other tenders submitted were those of Messrs. A. Ivery & Sons, London Colney, £3,623 8s.; Mr. H. W. Howe, Harpen-

den, £3,188 8s.; and Mr. G. P. Whitby, St. Albans, £3,037 8s.

TANDRAGEE.—At a special meeting of Tandragee U.C., Mr. W. A. Camblin, Edward Street, Portadown, was awarded the contract for the building of 11 artisans' houses at a sum of £3,818. There were 12 tenders, the highest being £5,250.

WESTMORLAND.—The West Ward (Westmorland) R.C. have let contracts for the £52,000 water scheme for which Mr. J. J. Davison, Wigton, is the engineer. The principal contractors are: Pipe line, Messrs. D. Thomson & Sons, Carlisle, £45,250; two reservoirs, Messrs. Hall & Busfield, Ltd., Leeds, £4,177.

A New Concrete House

A unique system of concrete construction is being used at Cambridge for the erection of 30 houses by the Corporation. The walls of the houses consist of slabs of concrete cast on horizontal wood platforms. The door and window frames are placed on the platforms and the walls cast round them. The walls are then placed in position in a few minutes by a specially designed crane, and it is stated that at least one house a day can easily be erected. The casting of the walls is done by unskilled labour, and no scaffolding is required. One hundred and seventy houses in Amsterdam have been built on this system and inhabited for four years. The Cambridge houses are the first to be erected in this country on the system. The advantages are said to be that the houses are impervious to external damp; that the construction is particularly strong; that the smooth inner walls enable most of the plastering to be dispensed with; and that the system is adaptable to different designs. The price of the houses being built by the Cambridge Corporation is approximately £467 per house.

The Auctioneers' and Estate Agents' Institute

Nine hundred and twenty-six candidates have sat this month for the examinations of the Auctioneers' and Estate Agents' Institute. The examinations were held in London, Birmingham, Bristol, Cardiff, Manchester, and Newcastle-upon-Tyne. The results will be announced about the end of April.

The work at "Butcher's Farm, Buxted," is under the supervision of "Mr. E. A. Chilton, A.R.I.B.A., of Uckfield;" and the work at "Boship Farm, Hellingly," under the supervision of "Messrs. Underdown & Duke, LL.S.A., of Seaford," and not as stated in our last issue.

Trade Note

Messrs. Art Decorations, Ltd. (Incorporating C. A. Orchard & Co., Ltd.), have changed their title to Tile and Mosaic Decorations, Ltd. (Incorporating C. A. Orchard & Co., Ltd.), 146 Grosvenor Road, S.W.1.

The BRAITHWAITE Pressed Steel Tank

A standardised product of simple construction, easy to handle and erect, and supplied from stock. The material for this tank is packed for shipment so as to ship as dead weight.

The Indispensable

'URE' BACK TO BACK GRATE

No Grate has sprung so rapidly into public favour.

The Features of the 'URE' Grate are Simplicity and Strong Construction—it is easily built in and easily cleaned. Dampers and Flues have been reduced to a minimum and no complicated fittings exist.

APPROVED AND SUPPLIED IN
BULK QUANTITIES TO LONDON C.C.,
EDINBURGH, MANCHESTER, GLASGOW
and Etc.

20,000 'URE' Back to Back Grates are now giving perfect service, and
SUPPLIED WITH OR WITHOUT DIRECT FLUE TO HOT PLATE.

In ordinary Housing Schemes where the maximum of fuel economy is a consideration, we advise, from our long experience, the elimination of the direct Flue to the Hot Plate, as Boiling, Stewing, etc., can be carried out perfectly on the bottom Hot Plate of the Oven with a small fire, but when any occasion arises—Roasting in the oven, Boiling and Stewing on the Hot Plate can be done at the same time simply by increasing the consumption of fuel.

In larger houses where full simultaneous Cooking facilities are continually in demand, we recommend the addition of our direct Flue, necessitating a heavier fuel consumption but which meets every culinary requirement and involves no extra cost. This addition, of course, adds to the domestic labour in cleaning and working the extra flue and damper required, and scarcely conforms to the inclinations of the modern housewife who desires the minimum of flue cleaning.

Law Report

Builders' Libel Action

In the King's Bench Division recently, Mr. Justice Green and a special jury began the re-trial of the action in which Bovis, Ltd., builders and contractors, of Upper Berkeley Street, W., claimed damages and an injunction for alleged libel published in 1925 by the defendants, officers and members of the London Master Builders' Association. The defendants were Mr. Fred Thorne, the then president; Mr. Henry T. Holloway, an ex-president; Sir Walter Lawrence, a member of the Council; Mr. Ernest J. Brown, a director of the Association; and Mr. W. J. Rudderham, the secretary. Defendants pleaded privilege and justification.

The action came originally before Mr. Justice Horridge, who, after a four days' hearing, withdrew the case from the jury and directed them to find for the defendants. The Court of Appeal ordered a new trial.

The plaintiffs, it was stated, in October, 1923, resigned from the London Master Builders' Association, being dissatisfied with the policy of the Association in regard to the letting of tenders. Wishing to get a certain contract finished, plaintiffs paid some of their workmen more than the standard rate of wages, but reverted to the standard rate when the work was completed. The defendants, on behalf of the Association, in April, May, June and July, 1925, issued to architects, quantity surveyors and others interested in the building trade, a series of statements containing the alleged libel, which was that the plaintiffs had been in "wage rate default."

Sir John Simon, K.C., for the plaintiffs, said he should submit there was no occasion for privilege, because the alleged libels had been sent all over the

place by the thousand. When these statements were published, Bovis, Ltd., were paying the standard rate of wages and no more. They had refused to sign a form, known as Form A, agreeing to pay the standard rate of wages and to carry out the directions and instructions of the Association with regard to all matters relating to trade disputes, and because of that refusal the statement was broadcast that they were in wage rate default. Bovis, Ltd., were doing an increasing business, but after this untrue statement was published the stream turned the other way, and the actual money loss to the firm, apart from the damage to reputation, was from £18,000 to £20,000 in the next twelve months. The suggestion in the libel, said counsel, was that they had done something discreditable, and that they were defaulters.

Mr. Digby L. Solomon, F.R.I.B.A., gave evidence that he had known Bovis, Ltd., for a number of years, and if he received a circular about them from the London Master Builders' Association it would be likely to influence him. He received the circular dated April 8, 1925, which stated that a number of firms, including Bovis, Ltd., were "now in wage rate default."

His lordship said it was perfectly clear that the circular meant that Bovis, Ltd., had broken some undertaking.

Mr. W. A. Yates, of the firm of Yates, Cook & Darbyshire, architects and surveyors, Great Marlborough Street, W., said he received the circular of April 8, 1925. Clients were chiefly dependent upon their architects for the selection of firms of builders in whom they had confidence for the purpose of asking them to do work, and if there was trouble it was the architect who was blamed. Witness had never seen the by-laws of the London Master Builders' Association.

After further evidence the hearing was adjourned.

LEASEHOLD REFORM

The Government, as promised in the King's Speech at the opening of the present Session, have introduced a measure to amend the present system of leasehold tenancy; but their proposals, apparently, do not go far enough to meet the views of the Leasehold Reform Association, which has produced a measure of its own, and this was introduced into the House of Commons and read a first time on February 23rd. It is not disputed that the existing leasehold system presses unfairly upon tenants in some respects or that the time is ripe for some re-consideration of the terms upon which leases are usually granted. The case of the shopkeeper, who, to continue a considerable business depending largely on its position, has to submit to such onerous terms as a heavy fine or premium for a new lease, the expense of rebuilding the premises on stipulated lines and the payment of an enormously increased rent, is a case in point. Almost equally grievous is the case of the shopkeeper, especially the small shopkeeper, who finds a new lease of his premises granted over his head to a rival concern. Other instances in which a respectable lessee may be victimized could be cited as matters which call loudly for amendment. But a perusal of the Landlord and Tenant Bill, which the Leasehold Reform Association has promoted, leaves us with the impression that it errs quite as unfairly against the landlord as the present laws do against the tenant. Not to put too fine a point upon it, the granting of a lease would almost amount to the expropriation of the landlord's property, and as the Act is, apparently, intended to be retrospective in action, it would work very unfairly to existing lessors who would have no opportunity of deciding whether or not they would grant leases of their property in future. In fact the landlord's only safeguard, if this measure became law, would be to refuse to grant any tenancy that would come within these new provisions. In essence, the tribunal established by the Acquisition of Land (Assessment of Compensation) Act, 1919, is to become the sole future arbiter of the disposition of the landlord's property. To this tribunal the

tenant may prefer claims, some of which, if granted, would, we think, have a definite retrograde effect upon the better and orderly development of property and, possibly, the amenities of a whole district. To take the case of a garden city or suburb, for instance, where the promoters, to preserve its character, do not sell the freehold of the buildings but grant long leases with restrictions as to use and alteration. Under this Bill, the tenant may move to compel the landlord to sell the freehold of the premises he leases, or for the "discharging or varying of any covenant contained in any agreement affecting the holding, or dispensing with the consent of the landlord or any superior landlord to the doing of anything which by the terms of any such agreement cannot be done without such consent." Such a provision would work very badly for the community as the whole, however much it may meet the interests of the individual tenant. We do not think any Government, that desires to check the selfishness and rapacity of some landlords would consent to a measure that gave opportunities for equal selfishness and rapacity on the part of tenants. It should be noted that the Bill does not apply to agricultural holdings, where the provision of compensation for improvements to the outgoing tenant is already in force. Security of tenure, and the right of an outgoing tenant to compensation for improvements made by him should be the essence of a leasehold reform measure. Even then there are difficulties. Who is to determine whether money spent by the tenant has improved the premises; equally well, it might have unfitted them for any ordinary or normal purpose. The right of a tenant to force the sale of premises, upon which he could erect any sort of incongruous building and carry on any unpleasant trade, not actually noxious, would work havoc on the big estates and would be detrimental to the better architecture of cities and to the interests of the community as the whole. The Government measure has now been published, and appears to us to protect the legitimate interests of the business tenants without paving the way for a whole host of new difficulties and abuses.

Notes and Comments

The Threat to Chiswick

It is rather disquieting that a public authority like the London and Home Counties Joint Electricity Authority should still be seeking to dump down a big electric power station in Chiswick, where it will seriously impair the amenities of both the river and the district. The Electricity Authority appear to have secured a lien on the Chiswick House property, and with this advantage bargained with the Urban District Council, who agreed to exchange 45 acres of the Duke's Meadows along the river bank, given to the district as an open space, in exchange for Chiswick House and its 68 acres of park land, which lie away from the river. Faced with the proposals of a statutory authority, the Local Council seems to have done its utmost to make the best bargain it could. Very strong opposition was aroused not only in Chiswick, however, but in Barnes and other adjacent districts. The authority's private Bill was rejected by the Parliamentary examiners, and the Minister of Health vetoed any divergence of the Duke's Meadows property from its stipulated purpose. The electrical authority is now promoting a fresh Bill, in which all kinds of safeguards are put forward to secure local amenities. But is it really necessary to have this big power station there at all. We think the onus should be on the Authority to show that this is the only 45 acres in the western part of the Home Counties that could be used for the purpose, remembering that it is not proposed, apparently, to barge coal to the station, but only ashes away from it. What about the new industrial district at Hayes, for instance?

The Amenities of Chelsea

Possibly the threat to Chiswick, to which we have referred above, has stirred up Chelsea, which already possesses a power station, to the formation of a protection society. An inaugural meeting, held last week at Wentworth House, Swan Walk, and attended by numerous prominent residents in the neighbourhood, including the Mayor, was presided over by Lord Ernle. Principally, the almost certain destruction of Lombard Terrace, and the proposed building over of the open space at the Duke of York's headquarters, seem to have been the deciding factors that have brought Chelsea's inhabitants together in defence of their common interests. The formation of such societies is greatly to be commended; and we can only hope that others will be formed in all districts in London. They can, as Mr. Reginald Blunt predicated for the Chelsea Society, be constructive as well as protective; and, without unreasonably interfering or opposing necessary developments, which must necessarily follow on the continued growth of London, they may be effective in preventing many of the barbarous innovations which London suffered through purely selfish exploitation in the last century.

The Danger of Sandstone

A motion in Parliament last week for a supply vote, to include a first instalment of £20,000 on account of reparation work to the fabric of the Palace of Westminster, was opposed on the ground that the Stancliffe stone, which it is proposed to use, is dangerous to the workmen employed in its preparation; and for this reason this particular variety became a scapegoat for all the silicious building stones of which it is a notable example. The contention of the opposition, led by some members of the Labour Party, rather made it appear that Stancliffe stone had a more evil reputation than other sandstone in this respect; but they were by no means clear at what particular

stage the danger was most appreciable. Statistics advanced went to show that sandstone workers had a greater predisposition to phthisis than workers in limestone; but the figures were neither very definite nor conclusive. The trouble is, of course, the dust given off in the process of working, and this arises mainly in the sawmills. Carried to its logical conclusion, the opposition would prohibit the working and use of sandstone for building. No doubt the operation of sawing into blocks does give rise to the dissemination of fine dust, and from the evil effects of breathing this the workmen should be protected. If we are correctly informed, that the dust is too heavy to be removed by the ordinary suction plants installed to prevent ill-effects to the workers in other dusty industrial processes, it should surely be possible to devise masks to cover the mouth and nose which would effectively protect the workmen engaged in cutting sandstone blocks. If the efforts of the opposition had been directed to securing some safeguard of this character, it would, probably, have had more success than the attempt to prohibit the use of sandstone altogether.

The Decay of Stone in London

Mr. J. Allen Howe's lecture last week on the "Stones of London" was probably arranged by the Royal Institution many months ago; but it was delivered rather opportunely at a time when Parliament was discussing the relative merits of sandstone and limestone for the repair of its habitation. The silica of the first is, of course, indestructible, not so the cementitious material that unites the grains of silica; limestone is more homogeneous, but readily attacked by the acid-laden air of towns; and neither, therefore, is very enduring in the London atmosphere. Mr. Howe detailed some of the efforts made by the Department of Scientific and Industrial Research to grapple with the problems of decay and preservation. His own remedy, which was the shortest and most efficacious, was the thorough purification of the town air. This is so obvious, however, that, despite the efforts of the Smoke Abatement Society, we fear it is not likely to become practical politics in our time. The private coal fire is still sacrosanct as well as wasteful. Dr. Barlow, speaking at Wallasey on Friday last on "Atmospheric Pollution," drew attention to increasing disfigurement by smoke of the new Liverpool Cathedral.

"One Way" Traffic in the City

The report that the City traffic authorities, in conjunction with the London Traffic Advisory Committee, are considering proposals for "one-way" and "roundabout" traffic systems in the City of London has been hailed in some quarters as a startling innovation in the famous square mile. The "roundabout" system will certainly be new to Gog and Magog; but "one-way" traffic is not unknown to those civic deities. Many of the City streets are little better than alleys, and although the schemes will probably deal with the wider traffic centres, such as those in front of the Mansion House, the approach to London and Blackfriars Bridges, it will be obvious that the best course for the City to pursue is that advocated by the town-planning authorities—the discouraging of through traffic as far as possible. The City area should be regarded as one for traffic to approach, but not to traverse save in exceptional cases.

ESSAYS BY THE WAY

I.—The End of the Renaissance

By "SCRUTATOR."

The division of history into periods is a very inexact and makeshift affair. In our young youth we start off so gaily with our neatly presented statements of the reigns of kings and queens, beginning with the famous date of 1066—the only date out of the whole list that I can think of with any exactitude. But, as we get older we begin to realise that this cataloguing of events is only very approximate, that epochs and events are determined and delineated by other boundaries than the deaths of kings and queens, however convenient these high passings may be as notches in the stick of time.

Architectural history in particular is most refractory; we have, for instance, long supposed that the advent of Henry VIII (who had so effective a method with wives who refused to say "obey") coincided with the end of the Gothic. We believed that when Henry Tudor met Francis Premier on the Field of the Cloth of Gold, that the Renaissance was immediately ushered in, and that the Gothic, both in this country and in France, from that instant miraculously ceased to be. This was a very comforting thought, and it was a most bitter discovery to find that the Gothic continued to flourish long after its supposed demise.

All this is very puzzling and disturbing, so much so that, when one speaks of the end of the Renaissance, the statement must be made with due reserve and hedged about with innumerable qualifications.

As a small boy I used to be much impressed with the fact—constantly reiterated—that "Queen Anne was dead," and in those days it was, whatever happened afterwards, more or less true. It was probably the false sense of security that this knowledge gave which made her reappearance so startling. For she really was as indubitably dead as Tottenham Court Road and the speculative builders of the eighteen-seventies could make her. Then came naughty Mr. Norman Shaw, who sedulously, and I think in a somewhat ghoulish fashion, set to resurrect the Old Lady—at any rate, before *his* demise she was sufficiently vigorous, if not absolutely established.

The reincarnation of Queen Anne would appear to have again re-established the Renaissance which, according to the table in our history books, was supposed to have died of inanition and want of proper nourishment in the early years of the nineteenth century. So that when I now speak of the end of the Renaissance, let it be very clearly understood that I do not mean the real Renaissance, but only that

Indian summer variant which flourished so vagariously until the moment when Sir Lawrence Weaver, having visited the French Exhibition of Modern Decorative Art, returned and told us, emphatically, all about it. There had, of course, been sudden conversions before this. Notably, when Prof. Richardson, in sackcloth and ashes, mounted the penitents' stool at the Architectural Association and promised, with tears in his voice, that for the future he would lead (in the modernistic sense) a better and truer life.

These were notable additions to the ever-growing band of the faithfully devoted, but it was not until Prof. Reilly started to talk of "fabrications" that I realised that the "game of cornices and sash windows" was so seriously jeopardised—that the end, which had for so long and clamantly been foretold, was now clearly indicated!

I think it must have been the pronouncement of Sir Lawrence Weaver that most affected me, for he has been so peculiarly associated with Sir Edwin Lutyens and the "Queen Anne." He was so much the herald, if not the discoverer of Sir Edwin, that his recantation—not, of course, of Sir Edwin, but of the mistress that they both so efficiently served—came with the solemnity of a great event: it seemed, as it were, to chronicle an affair of historic importance. Prof. Reilly has since put forward a plea for Latinity, and has somewhat jocularly assailed his fellow Professor's conversion, but there is still that fatal talk of "fabrications!" And if this were not enough, on top of it all comes the "Prix de Rome."

Generally speaking, I enjoy an exhibition of students' work; there is an élan, an air of freshness and youth about most of them that takes the harassed and weary practising architect out of himself and into another, and for the time being, a better world, the world of "might have been!"

But this affair at South Kensington might be called a world of "has beens." Perhaps it is in contrast to the youthful gaiety of the New Zealand exhibits, in the adjoining gallery, that by comparison these drawings for the Prix de Rome look so distressingly and particularly dull. I do not mean to say that they do not show a certain amount of ability, the greater part of them show a very high degree of ability, but they do not—at any rate, to my eyes—show much sign of enjoyment. They appear to proclaim that this is a very serious and solemn occasion, that this is unmistakably the greatest of the architectural students' chances, that the chance is official and academic, and that we, therefore, the authors of these drawings, are horribly self-conscious and afraid.

This exhibition would appear, above all, to announce the "end of the Renaissance," for if a period cannot be enjoyed, then it will soon be forgotten. I must not forget that there are one or two rebels amongst the contestants, but even they, in spite of their having adopted a brand new style of coloured and spotted concrete straight from Paris, also appear to have been overcome by the dullness of the occasion. If the majority of the competitors are brightly dull, then these non-conformists are dully bright. Of course it may have been that the subject—"A Grand Staircase at an Embassy" is not one to be treated with levity. One imagines that even a Bolshevik headquarters would produce a certain feeling of awesomeness, that an Ambassador or a Minister Plenipotentiary and Extraordinary (if this is the right description) even from the most revolutionary of countries, would sufficiently catch the spirit of the occasion, would, as it were, be sufficiently in the picture to impart the necessary degree of dignity. But, if the subject must bear its share of responsibility for so subduing our architectural youth, I think the subject alone be held entirely responsible

for the altogether extreme and chilly respectability that pervades the show.

The best classic art always appears to me to suggest that the authors of any particular piece of design that shall really affect us have forgotten more than they have shown; it is in their selectiveness that they chiefly score, and, like a person of fine manners, are at their best and most truly impressive when they make the least display. But these students spare us nothing, and the intrusiveness of their designs is only aggravated by their unwarranted emphasis. In only one design could I trace the right kind of detachment, the hint that the Renaissance might, if treated familiarly enough, still prove a tractable and delightful servant. Wild horses could not drag from me the pseudonym of the competitor in whose work I found this alluring quality of smiling comprehension. I am glad to say that he is to be found among the happy selected, so that all the finalists can take heart of grace and proceed to the attack with joyous energy! Is it that our revived Renaissance (how funny the words look in conjunction) which so emphatically and formally registered our protest against the untidy informality of the nineteenth-century industrialists, with their thin veneer of the mediæval, which said "Service" when they meant "Exploitation," is in its time giving way to something simpler? Does it mean that the revived privileges of the eighteenth century are found to be a little cumbersome: that in modern life to have to live up to being a Duke (or should one say, live down?) might be a very tiresome and bothersome business? Does it mean that even the proudest duke would at times like to revert to the simple citizen; that the full panoply of column and entablature, with all the necessary attributes, would be better for a little alleviation? The Swedish architects are credited with having made the grand escape from Palladianism, and even if, in their later works, they would appear to hint at a hankering after Latinity, they are, it must be conceded, sufficiently emancipated to have registered a new movement, a movement, let it be at once admitted, not entirely confined to Sweden.

The Swedish sculptors are in no whit behind the architects; *how emancipated* they are can be realised by a visit to the Tate Gallery, where some examples of Professor Carl Milles' sculpture are on view.

The first effect of this exhibition viewed as a whole is of a surprising modernity. He comes to those who see him for the first time with the delightful shock of a Mestrovic; but as one becomes more attuned one finds a hint of the Greek here, and perhaps more than a hint of the mediæval there, until one is awakened to the beauty of all related things—that is, related through an intense comprehension of their reality. But all this freshness, all this originality, even admitting a slight echo of Greek and Mediævalist, does not this mean that we have definitely reached the end of the Renaissance? In answer I would ask you to look at his pair of dancing girls and—I wonder!

The Inter-Departmental Committee appointed to survey the prices of building materials have submitted to the President of the Ministry of Health and the President of the Board of Trade a schedule of prices ruling during the month of February, and this includes also, for purposes of comparison, the prices for April, 1914, and January, 1924. Bricks appear to be decreasing in price (with the exception of Flettons), but are still higher than they were before the coal stoppage. Cement is about the level of last May, but lime, while cheaper, is still above the May, 1926, level. Other building materials have fallen in various degrees, but there are wide variations and the majority have not reached pre-coal-stoppage figures.

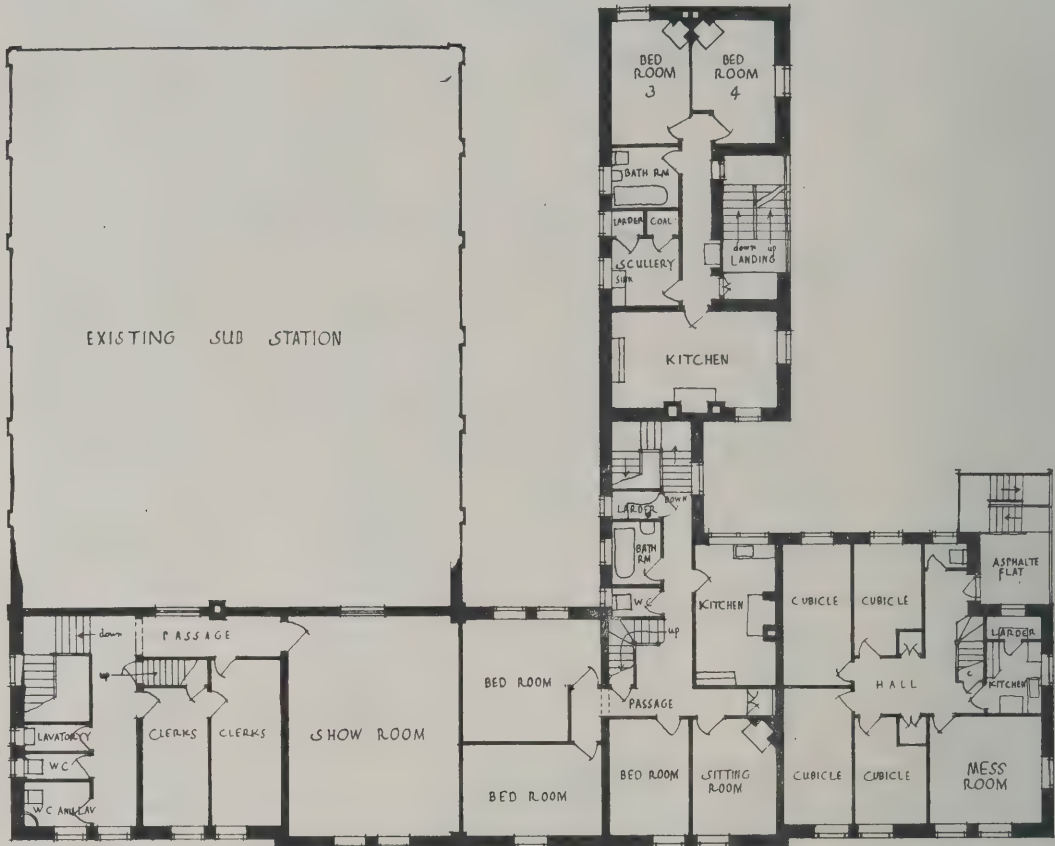

HOVE CORPORATION FIRE STATION AND ELECTRICAL OFFICES: THE ENTRANCE ARCHWAY.
MESSRS. CLAYTON & BLACK, Architects.

FIRE STATION AND ELECTRICAL OFFICES FOR THE CORPORATION OF HOVE

Messrs. Clayton & Black's design for a fire station and electrical offices at Hove has many points of interest. With great skill they have succeeded in designing a formal and symmetrical elevation towards the street, while at the same time satisfying the highly complex conditions of internal planning. The existing sub-station, which fortunately was situated about 20 feet behind the pavement line, could be incorporated into the new building without compromising its principal façade. In the planning of modern buildings of a public or semi-public nature it is becoming ever more difficult to obtain the much desired effect of architectural simplicity, for the demands for a number of small subsidiary apartments in connec-

tion with the main structure are constantly growing, and all the small rooms need to be lit and ventilated from outside walls. An architect of such a building, therefore, may congratulate himself if he can make even one façade decorous and let the remaining ones be mercifully hidden by adjacent buildings. In the present instance, Messrs. Clayton & Black have been able to place a considerable part of the required accommodation in a wing placed at the rear of the building, and it may be assumed that the façades of this wing, necessarily lacking in formal cohesion, will not obtrude themselves upon public view.

The plan is divided by an entrance carriage-way of ample width which communicates with the sub-

FIRST FLOOR PLAN

GROUND FLOOR PLAN

NEW FIRE STATION AND ELECTRICAL OFFICES FOR THE CORPORATION OF HOVE.
MESSRS. CLAYTON & BLACK, Architects.

station. On the left are the offices of the manager and clerks, while on the right are the recreation room for employees and the large "appliance room." It is noteworthy that in spite of the differences in the functions and sizes of the various apartments on either hand of the entrance carriage-way, the architects have succeeded in obtaining a symmetrical pattern of the elevation. The two large double door entrances to the appliance room have been enclosed in arches, which have been exactly reproduced on the other side, one arch being employed to mark the public entrance to the offices, while the other emphasises the importance of a wide "show-case." It seems scarcely necessary to defend such an arrangement, but as certain architectural "purists" might object to the apparent lack of "truthfulness" in thus balancing features of such divergent purposes, one may point out that the appropriate expression of the building as a whole is more successfully achieved by an orderly façade in which the parts are made duly subordinate to the whole than by an arrangement that allows each single little apartment to acquire a quality of individualism. The architects have here succeeded in giving to their design its appropriate status, for the formality of the elevation with the important entrances effectively suggest a public building of a utilitarian nature, while the lantern with its little dome and finial give to the structure an institutional character.

In the wing at the rear are situated quarters for officials, consisting of kitchen scullery, bathroom and two bedrooms, this little flat being repeated upon the first and second floors. Above the electrical offices are a showroom and additional rooms for clerks, while in the attic is a large store-room. On the first floor of the fire station is a flat for the official in charge, and cubicles and mess-room for four firemen, who have their lavatory accommodation in the attic. It is thus apparent that comfortable quarters have been provided for eleven officials of the fire station, while in the same building is a very well equipped set of electrical offices. The combination of these two services in a single building is not in itself illogical, and there can be no doubt that the architectural result of their being grouped in a single symmetrical composition is a satisfactory one. It must be confessed, however, that there is a tendency in modern designs to achieve symmetry at all costs, and while recognising the merits of Messrs. Clayton & Black's design, a critic might not unprofitably amuse himself by considering whether the fire station and electrical offices could have been given separate expression and yet remained in harmony with each other.

The general contractors were Messrs. Barnes & Sons, Nestle Street, Brighton; and the following is the list of sub-contractors: Electricians, Messrs. Page & Miles, Ltd., Western Road, Brighton; hot water engineer, Mr. W. H. Fellingham, Bond Street, Brighton; fittings for appliance room doors, Messrs. Try & Sons; asphalt roofs, Mr. G. Asserati; ironmongery, Messrs. Parker, Winder & Achurch, Ltd.; facings, Grange Road 2-in. stocks with Monks Park dressings, by The Bath and Portland Stone Firms, Ltd.; carving, by Mr. McGinnity, of Brighton; wrought iron gates, Messrs. Morris Westminster Guild. Special fittings for exit doors to sliding poles were designed by the architects. The contract sum for the work was £15,600.

The tenants of Golden Square, London, W.1, met and formulated a scheme for the protection of the Square Garden. Mr. Lionel de Rothschild, who presided, said the garden was protected by an Act of Parliament, and until that was repealed the square could not be built over. A committee was appointed for the protection of the open space, which is important to the Hospital for Diseases of the Throat, Ear and Nose in the square.

Coming Events

Joint Delegation of the Local (Yorkshire) Associations of the Institutions of Civil and Mechanical Engineers, etc.—The Second Joint Delegation Dinner will be held on Friday, April 8, in the Great Northern Hotel, Leeds.

Royal Institution of British Architects.—The visit arranged by the R.I.B.A. Art Standing Committee to the Star and Garter Home, Richmond, will take place on Saturday, April 9.

Association of Architects, Surveyors and Technical Assistants (Met. Division).—Saturday, April 9.—Visit to Messrs. Siemens Bros. & Co., Ltd., works at Woolwich Road, S.E.; meet at works at 2.30 p.m. Saturday, April 23.—Visit to Southwark Cathedral; meet outside Cathedral at 2.30 p.m. Monday, April 25.—Members are invited by the Architectural Association to attend a Lecture by Prof. S. D. Adshead, F.R.I.B.A., on "Regional Planning," at A.A. Rooms, 34 Bedford Square, W.C., at 7.30 p.m.

The Surveyors' Institution.—Monday, April 11.—Mr. George Turville Brown on "The Sugar Beet Industry in Great Britain." 8 p.m.

Royal Institute of British Architects.—Monday, April 11.—Professor Patrick Abercrombie, F.R.I.B.A., on "The Planning of East Kent." 9 Conduit Street, W.1. 8 p.m.

Sheffield Society of Architects and Surveyors.—Thursday, April 14.—Annual General Meeting.

Edinburgh Architectural Association.—Saturday, April 16.—Visit to Borthwick Castle.

The London Society.—Friday, April 22.—Professor A. E. Richardson, F.S.A., on "London Street Architecture." 18 John Street, Adelphi. 5 p.m. On Wednesday, April 20, two Visits will be paid to The British Museum. 10 a.m. and 4.15 p.m.

Hampshire Architectural Association.—Friday, April 22.—Annual General Meeting and Election.

Architectural Association.—Monday, April 25.—Professor S. D. Adshead, F.R.I.B.A., on "Regional Planning." 34 Bedford Square, W.C.1. 7.30 p.m.

Royal Society of Arts.—Wednesday, April 27.—Mr. George E. Keay, F.C.I.E., on "Fire Waste (Loss of Property by Fire) and its Effects on the Economics of National Life in Great Britain." John Street, Adelphi. 8 p.m.

Royal Institution of British Architects.—The Annual Exhibition of Modern British Architecture will be held in the R.I.B.A. Galleries from April 27 to June 3.

Electrical Exhibition.—Friday, April 29.—The Mayor of Stepney will open an electrical exhibition at The People's Palace, Mile End Road. 3 p.m.

The London Society.—Friday, May 6.—Annual Dinner at the Hotel Victoria.

The South Wales Institute of Architects.—Exhibition of Photographs of Modern Buildings. The City Hall, Cardiff. May 9-14.

The Garden Cities and Town Planning Association are organising a tour of local Government officials and others to inspect housing and town-planning schemes in the South of England. The tour will last from April 22 to 28.

* * *

The Carpenters' Company are giving active assistance to raise money for the help of Royal Society of Arts Fund for the Preservation of Ancient Cottages, inaugurated recently by the Prime Minister.

* * *

The construction of the new harbour works and deep-water wharves at Beira have been officially authorised, and will be begun immediately.

Fig. 1.—In the Rue de la Paix is Atkinson's Perfume Shop. The design is simple, and the colour—green, black and white—is very successful. Width of front about 14 feet.

NOVELTY IN THE DESIGN OF SHOP FRONTS

Some Recent Examples from Paris

By HOWARD ROBERTSON. Photographs by F. R. YERBURY.

In the thoroughness with which they carry an idea to a logical conclusion the French are inimitable. The idea thus presented becomes the very quintessence of thought, relieved of all side issues which might cloud the main purpose. As a result, we see the idea in its pure form; and whatever its character, or value, it is expressed with such finish and clarity that it is easy to grasp and to appreciate.

The idea need not necessarily be of very subtle character, and may represent nothing much more than the intention to express a mood. It is as if one were to say "it is my intention to be frivolous," and then were to carry out this idea, through some medium, with such thoroughness that there would be no possible doubt but that frivolity had been attained.

Such thoroughness would not be very difficult to achieve. What would be infinitely more difficult would be to achieve an expression of frivolity which relied, not in obvious portrayal of the mood, but on

the very subtle and delicate suggestion of it. The more abstract is the expression of an idea, the more it is apt to appeal to the intellect; but, on the other hand, the less readily is it apt to be grasped by the average human brain. And so it happens that in practice, in order that an idea or an intention may "get across," it must be expressed always with a little force and crudity, the amount to be varied according to the public with which one is concerned. Much emphasis and plenty of italics are required for the American; quite a deal of realism is required for the Englishman; but the Frenchman can be satisfied by suggestion which is almost abstract, and which, through that very quality, has the concentrated strength of an essence. To express in drawing, to an American, the idea of a forest of trees, one would be tempted to draw as many trees as possible, and as realistically as possible. But the idea of a forest might be conveyed to a Frenchman by writing the

Fig. 2.—“Le Faune” is a Pottery Shop in the Rue du Faubourg St. Honoré, by Maurice Dufrené. It is executed in wood, coloured in a pinky yellow, and the door is in black iron. Width about 13 feet.

words “Une forêt,” and giving him a very small drawing of a highly conventionalised tree-trunk. There is, with the Frenchman, a response to any suggestion that is of subtle and delicate implication, provided always that the suggestion is one which, if it were to become an accomplished fact, would appeal to the French mind; for this mind is by no means catholic in its tastes, and there are some things—aims, moods, ideas—which the Frenchman will never appreciate. It is the limitation of racial temperament which is common to the people of all countries.

In the art of architecture this diversity of national character has led to the various traditional architectures of each country as we have known them in the past, and we now have the privilege of watching this process of racial expression going on in modern building all over the world at the present time. The only important difference between the past and the present in this matter is the growth of the international—or at least of the cosmopolitan—spirit at this period of history. There is so much travel, inter-communication and exchange of literature, and of ideas of all sorts, including those on education, that no country can entirely escape the architectural influences of its neighbour, particularly in those expressions of the art in which it has been peculiarly successful.

In England we have more than once paid the compliment of imitation to America in respect of offices

and business blocks, for in the planning and equipment of this type of building the American has become pre-eminent. From Germany and Holland we have acquired, perhaps unconsciously, a taste for a broader modelling of our shapes and masses, and from France we are gladly receiving all sorts of hints and tips and ideas with regard to furniture, decoration and all the arts of elegance, including those which are concerned with the humbler materials of building, for French craftsmanship and skill is not confined to the alabaster and “bronzes d’art” which figure in the windows of the Rue de la Paix quarter of Paris.

The treatment of the shop front is one of those matters in which the French have always excelled; the opportunity for display, for graceful arrangement and the introduction of elegant forms and, above all, the chance of expressing in concrete shape the character and quality of the shopkeeper’s business, provides for the French designer exactly the kind of problem which he is best fitted by taste and temperament to solve. That full advantage is taken of the opportunity is shown by the large number of charming and original shop-front designs which have been executed in Paris within the last four or five years.

The Paris Exhibition foreshadowed the type of shop in which a clever design and interest of craftsmanship were very largely called upon to take the place

Fig. 3.—Toy Shop in the Rue du Faubourg St. Honoré; Elkrouken, architect. The façade is in white cement stucco, with black ironwork fittings. The width is about 14 feet.

Fig. 4.—An antique dealer's and a modiste's shop side by side in the Rue du Faubourg St. Honoré. The pointed windows are glazed with engraved and etched glass, a type of decoration which is growing in popularity. The antique shop is in black and pink marble. Width about 17 feet.

Fig. 5.—Nesta's in the Avenue de l'Opéra. R. Fischer, architect; E. Wadens, sculptor. Note the reliefs on the piers, and the simple elegance of the marble front framing the show-case. The lettering is in bronze metal antique, and the metal work generally has a brass finish. Red velvet forms a background to the show-case.

of rich materials and wealth of detail. The economic factor presses hard on the design of all but luxury schemes, and there is evidently a very wide demand for the shop which is filled with extreme simplicity but designed very skilfully to obtain the maximum publicity and display value. In achieving this, the French designer seems to manage with the same success as does the French woman in the matter of dress; it is the old problem of looking very smart without wearing anything expensive.

The simpler designs depend very much on effects of contrast, as, for instance, a plain general background of white stucco relieved by very restricted spots of bright colour and by the interest of shape and texture of metalwork (Fig. 3). Or again, the major effect will lie in the veining of a marble, and the harmony of its smooth surface with that of the plate glass front with its elegant curved angles (Fig. 5). Atkinson's scent shop in the Rue de la Paix (Fig. 1) depends on the contrasts of its black and white marbles, the green-painted iron glazed with coarse glass, the blue-green ceramic bouquet below the cornice band, and—when the shop is shut—the gold of its rolled shutters.

Very pleasant, too, is the little pottery shop in the Rue du Faubourg St. Honoré, "Le Faune," designed very simply in wood, but gay in colour (Fig. 2). It is painted a pinky yellow, with a green base and a black iron door, on which is a charming plaque of a white faun on a blue-green background. The lettering on the fascia is in green, and the vertical bands terminating in an acorn are in gilt.

These are very simple schemes, not dependent for effect on a heavy initial outlay. Having this same virtue are plenty of other little shop fronts, such as the cake shop (Fig. 7) in pale stucco and yellow oak, the two fronts in the Rue du Faubourg St. Honoré (Fig. 4) for an antique dealer and a modiste, and the

highly original design for the Cheramy scent shop (Fig. 6) in the Rue St. Honoré. Still perhaps in this category, but approaching the luxury class, is the shop for Nesta in the Avenue de l'Opéra (Fig. 5), already alluded to, in light marble with delicate carved reliefs by E. Wadens on each pier. The showcase is set in metal of a brass finish, and is draped with red velvet, which stands well against the grey background of the shop itself.

Of all these shops, the majority of which have frontages of under 20 feet, the most original and interesting is probably that of Cheramy, since it depends for its effect on a striking composition of simple shapes supported by ingenious and by no means unrefined detail. There is something slightly ephemeral in the design: it does not pretend to be of materials which will last for all time, nor does it take itself too seriously. It is merely a little *fin de siècle* piece of design, light and cheerful as the objects which it frames, and with just that touch of "cheekiness" which is appropriate. It is even more than that. It is a shop which invites the passer-by to stop and flirt with the idea of purchase. It has the manner which is demure, but also, beyond a doubt, the eye which is glad. It is a very Parisian little shop.

In the course of underpinning operations in Founders Court, Lothbury, at premises occupied by Messrs. Brown, Shipley & Co., a piece of Roman pavement, about 8 ft. by 6 ft., apparently from the corner of a room, was unearthed and has been carefully raised and preserved. It is composed mainly of small red tiles, with a few black ones at intervals, and may be part of the pavement recorded as having been discovered at Founders Hall. Some pieces of pottery were also found under the pavement.

The proposed Memorial to General Wolfe, the hero of Quebec, will, it is believed, be found a site on Blackheath, opposite Macartney House, where he lived for a considerable time during his early years.

Fig. 6.—Cheramy's in the Rue St. Honoré. Very modern, of white marble relieved by black and gold incrustations. Note the sign, and the glass balustrade to the cleverly managed mezzanine balcony. The width of the front is about 21 feet.

Fig. 7.—This little tea-shop in the Rue du Faubourg St. Honoré is more traditional in character, but produces a good effect with simple means. Width about 15 feet.

Professional Societies

Competition Notes

Manchester Building Trades Exhibition—Architectural Design Competition

The following awards have been made in connection with the Architectural Design Competition organised by the Directors of the Tenth Manchester Building Trades Exhibition (see page 618):

First Prize (£150).—J. L. Martin, Hatherlea, Moston Lane, New Moston, near Failsworth, Manchester, and J. Stanley Walkden, Kenmore, Dales Avenue, Whitefield, Manchester (joint architects).

Second Prize (£50).—Messrs. Cooke & Harrison, 2 Gray's Inn Square, London, W.C.1.

Commended.—J. L. Gleave, 36 Church Street, Bradford, Manchester, and G. A. Goldstraw, 76 Cholmondeley Road, Pendleton, Salford (joint architects); G. L. Owen, 112 Holland Road, Kensington, London, W.14; G. A. E. Schwabe, West Hill Cottage, Braunton, North Devon.

Mr. Geoffrey Butler, M.P., has written to *The Times* recording the satisfaction of the Cambridge University authorities at the substantial measure of agreement arrived at between them and the R.I.B.A. Registration Committee in regard to matters connected with the Registration Bill.

POSTMEN'S OFFICE, HOVE: DETAIL OF DOORWAY.
D. N. DYKE, A.R.I.B.A. (H.M. Office of Works), Architect.

Two New Post Offices

The two new post offices here illustrated were both designed by members of the staff of H.M. Office of Works, and in this instance we can fortunately give the names of these practitioners. The policy of the Government, according to which official architects are allowed to emerge from ill-merited obscurity, is to be highly commended, and it may be hoped that the "anonymous" architect may soon cease to exist. As far as criticism is concerned, however, a certain difficulty arises when one begins to assess the various degrees of responsibility which respectively belong to the official architect and to the Government department he serves. Is the Government to take the blame if his design is a failure, and leave to him all the kudos if it is a success, or vice versa? Or are we to be left in ignorance as to the degree of freedom or restraint which marked his conditions of employment? In such a dilemma we are perhaps justified in assuming that the Government must accept responsibility for the general architectural policy pursued, while the official architect may accept the credit or the blame attaching to the manner in which this policy is carried out.

There appears to be evidence that the authorities in H.M. Office of Works wish to make a departure from the traditional style of post office, and have the ambition to erect, in country towns and in semi-rural districts especially, a more homely and more domesticated type of structure which will avoid that note of hardness, that stereotyped expression characteristic of too many "official" buildings of the past.

The two examples here illustrated, namely, the Horncastle Post Office and Telephone Exchange, by Mr. H. T. Rees, and the Postmen's Office at Hove, by Mr. D. W. Dyke, both of H.M. Office of Works, show the influence of this tendency. The former is situated in the market place of a small country town.

The ground floor is occupied by the public office, sorting office, and rooms for the postmaster, postmen and boys, together with the usual accommodation for cycles and trucks in the yard. The first floor is used for telephones and staff retiring-rooms, while the second floor contains caretaker's quarters. The main building is finished externally in plaster, with a brick plinth tiled roof and cornice of wood. The windows have teak frames and mullions fitted with steel sashes. The interior of the public office is finished in deal, stained to a subdued tone and polished. The floor is of black and white squared paving slabs.

The second building has a slightly different function to perform, as it is not utilised for ordinary post office business, but is a sorting office only. On the first floor are retiring-rooms for the staff. The fronts of the building are in hand-made, multi-coloured facing bricks and hand-made tiles. The entrance doorway, the plinth and cornice are in Portland stone.

The Horncastle design is a charming example of Georgian classic adapted to modern usages, and is certainly far removed from the unprepossessing post office façade with which we are all familiar. It is perhaps questionable, however, whether its thorough-going domesticity adequately expresses the purpose of the building, and while indeed the position of the box for posting letters is indicated, under the window to the left of the entrance, and the words "Post Office" are inscribed beneath the canopy of the door, many people in Horncastle will be asking "Where is the Post Office?" In the case of the Postmen's Office in Hove, the non-institutional character of the building does not matter so much, as the public are not invited to enter it. Both façades have points of interest, and H.M. Office of Works are to be congratulated upon these interesting architectural experiments.

Fig. 41.—TERRACE OF "NOISELESS" HOUSES: FACADE TOWARDS STREET.

THE TWENTIETH CENTURY HOUSE

XI.—The Exclusion of Dust and Noise

By A. TRYSTAN EDWARDS.

Noise seems to be the abiding impression that the returned traveller brings back from the great cities of the United States. We have not yet developed motor traffic to the extent existing in that country, but, even here, one of the worst curses of the present age is *noise*, and the more the means of public conveyance multiply, and the more private individuals possess their own motor cars, the more unbearable will our roads become. One solution is to put the houses as far as possible away from the roads, but this entails the expense of long connections with the public sewers, and also means that the gardens, instead of being behind the houses, where they are most welcome, are in front. Half covered with dust, and well within the sound of vehicular traffic, such gardens give but little pleasure to those who own them. The obvious solution is to place the houses right on the pavement to act as a screen between the gardens and the public thoroughfare. This is exactly what has been done in the design shown in Figs. 41 to 44. The next thing was so to plan the house that *all* the living-rooms face towards the garden. This is desirable, so that trams or motor buses may thunder by and the occupants of the houses will be almost entirely oblivious of the fact.

The unusual street frontage, illustrated in Fig. 41, and the object of the long blank walls separating the entrance of one house from that of the next, is thus sufficiently explained. And although the reader might at first jump to the conclusion that the design is purely eccentric, I think it will be clear that it is entirely conditioned by practical circumstances characteristic of our own age, and that, so far from its being a sort of "tour de force" having for its object the achievement of architectural notoriety, it represents a serious attempt to solve two urgent problems—dust and noise—which beset the domestic architect of the twentieth century.

It is for members of the "new poor" that the terrace of small houses, here illustrated, has been designed. I have assumed that the street frontage occupied by the terrace is on one of the tram or motor bus routes which nowadays penetrate far into the country. Thus no garages are shown in direct association with the houses, though, of course, there is nothing to prevent their occupants from keeping cars in a neighbouring garage, if such exists. I

have, however, in this instance given special attention to the needs of a family of moderate income, who wish to dwell some distance from the town, but yet with immediate access to public means of transport.

Next, economy had to be especially considered. It may be remembered that in the previous article of this series there was shown the design of a terrace in which not only the front doors but the secondary access to the houses were also placed upon the street front, with the result that the necessity for expensive "back" roads was obviated. I have employed the same device in this instance, and the "back" door—or "service" door, as it is now sometimes described, has been placed at the front of the house, easily accessible to tradesmen, milkmen and others; and in the event of coal being used, the coal can conveniently be brought in direct from the main street. Then let us consider the cost of drainage, always an important item. In the previous design all the sanitary conveniences were grouped together at the back of the house, but in this modern terrace, for further economy, I have brought them all towards the front, so that the connections of soil and bath pipes with the public sewer have been reduced to their minimum length. Moreover, an additional advantage accrues from this arrangement inasmuch as it frees every foot of the valuable garden frontage (in this instance especially precious for its quietude) for the use of the living-rooms. Thus the only apartments having windows on the street are the hall, lavatory, back passage and scullery on the ground floor and the two bathrooms and staircase landing on the first floor. And by means of the recess the presence of these minor domestic offices has been rendered inconspicuous and there is presented towards the street a simple and orderly façade consisting of a series of prominent entrance features with blank walls between.

How to treat these blank walls was a difficult problem, and I do not pretend that the solution here adopted is the best or the only one. It might have been quite possible to leave them without elaboration except plinth and coping stone and to give interest to the composition by making the entrance features exceedingly ornate. Again, I might have concentrated attention upon the walls and decorated them with great sculptured panels or

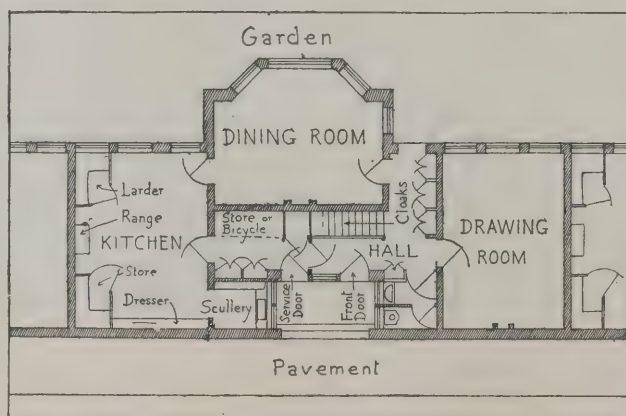

Fig. 43.—GROUND FLOOR PLAN, SHOWING DOUBLE ACCESS FROM STREET.

Fig. 42.—TERRACE OF "NOISELESS" HOUSES: FACADE TOWARDS GARDENS.

mural paintings. It might even be suggested that advertisement posters, if especially chosen for excellence of pictorial quality, might be permitted on the blank spaces. Such advertisements would undoubtedly help to pay the rent of the house! I have chosen here, however, to adopt the middle course and, while giving to the recesses a moderate amount of emphasis and elaboration, have relieved the simplicity of the blank walls by a straightforward pattern of flutings, punctuated at the top by a series of small planes of elliptical section and at the bottom by a row of rectangular panels in relief. I am assuming that the walls are in plaster. The flutings are shown at two-foot-six widths and need not have a depth of more than an inch. Such decoration, economical to execute, might serve to give the long walls enough surface interest to prevent them from being monotonous, while at the same time they will be sufficiently reticent to act as a foil to the entrance features, which are, after all, the main symbols of the human usage of the building. Moreover, the flutings have a certain appropriateness, as they seem to be making a silent injunction, "Stick no bills here!" With regard to the recesses themselves, to a certain degree they admit of individual treatment without compromising the formality of the whole front. Here is an obvious occasion for the use of colour. One recess might be scarlet inside, another blue, and so on. Or else a quite pleasant effect could be obtained if all the recesses were the same colour.

A detailed examination of the plans illustrated in Figs. 43 and 44 shows that on the ground floor there are drawing-room and dining-room, the latter being approached not only from the hall, but direct from the kitchen. Although it is assumed that electricity will be used for heating and cooking, the plan can be adapted without alteration for coal fires, a storing room for fuel being conveniently situated in the place now allocated to bicycles under the stairs in between the service door and the kitchen. Ample cupboards are shown on both floors; a space for cloaks is allocated in a row of cupboards near the garden door, while upstairs two linen cupboards open on to the landing, while a box-room is also provided. There is access to a lavatory and closet on the ground floor, approached from the hall, while on the first floor there are two bathrooms with wash-basins and also a second closet. The principal rooms have the following dimensions: Drawing-room, 18 ft. 6 in. by 13 ft. 6 in.; dining-room, 18 ft. by 14 ft. 6 in.; and two bedrooms commensurate with these.

The garden front is a repetitive design of a fairly conventional kind, except

that I have taken a certain liberty with the parapet over the bay window. It is assumed the roof is flat. There could either be a common garden, or else, if not, the frontage of each house being over 50 ft., there would be room for a tennis court in each individual plot.

The idea is capable of expansion on the square principle. In the enlightened examples of early town planning, which our London squares exhibit, the houses are built round a central garden but separated from it by the access roads. If our roads in future, however, are to take an enormously increased motor traffic, on which no speed limit is imposed, squares of these blank frontage houses, enclosing a central open space, would seem to be a desirable development for the safety of children and the exclusion of dust and noise. The houses, for extra privacy, could be allotted a certain strip of the inner area for individual gardens, the centre space being arranged and planted as a common garden, with tennis courts, etc. The amenities of the London squares could thus be provided and in improved form on about the same area of ground that would be occupied by a similar number of houses on other lines of development.

Book Review

Decorative Writing and Arrangement of Lettering.
By Prof. Alfred Erdman and Adolphe A. Braun.
(London: Sir Isaac Pitman & Sons, Ltd.) Second Edition, 1927. 10s. 6d. net.

As far as the shape of each individual letter is concerned, lettering is gradually becoming recognised as a most important part in the success of architectural drawings as drawings, and it was not until this book appeared that any logical conditions were suggested as to the actual arrangement of letters within the word, words within the group and groups of words on the drawing. As for lettering itself, Plate 64 in the chapter on how to draw lettering (by Arthur E. Burberry) is a particularly good example, and the plates of type faces at the end of

the book (by courtesy of the Pelican Press) are interesting, as the architectural types of to-day seem to be modelled to a great extent on these faces, the tendency being to imitate in pen form pure type faces, particularly of the Cochin and Garamond varieties. Although not written primarily for architects, there is a great deal of matter which those who strive after the tasteful presentation of drawings will find valuable.

Fig. 44.—FIRST FLOOR PLAN.

HOUSE AT WELWYN GARDEN CITY.
C. M. HENNELL, F.S.I., & C. H. JAMES, A.R.I.B.A., Associated Architects.

This house forms one of a group of four which were erected for sale on a commanding site in Parkway, Welwyn Garden City. The materials are 2-in. multi-coloured facing bricks, with Bridgewater interlocking tiles for the roof. The balcony to the staircase windows is a piece of eighteenth-century ironwork adapted to its new position. In the photograph of the garden front it will be noticed that square abutments at each side of the bay window completely stop the widely overhanging eaves, thus avoiding the awkward intersection of the eaves with the canted side. The builders were Messrs. J. B. Seward & Co. (Mr. Henry Dyke), of Wokingham.

MANCHESTER BUILDING TRADES EXHIBITION—ARCHITECTURAL DESIGN COMPETITION
 FIRST PREMIATED DESIGN: J. L. MARTIN and J. STANLEY WALKDEN (Manchester University School of Architecture), Joint Architects

THE MANCHESTER BUILDING TRADES EXHIBITION COMPETITION

This interesting competition was instituted by the Manchester Building Trades Exhibition with a view to obtaining designs for a re-grouping of the buildings in an important centre of the city. The area chosen was that between the Town Hall and Rylands Library. The competitors were asked to submit designs for new façades on the north, south and west sides of Albert Square, and for a new grand avenue to be laid out between the Town Hall and Rylands Library. It is not assumed that the Manchester Corporation will take steps to have the winning design carried out, and the competition is merely an "academic" one. It is very valuable, nevertheless, inasmuch as it stimulates public interest in architecture when speculative schemes of this nature are

submitted to the consideration of the public. In this instance great care was taken by the authorities of the Trades Exhibition that they should have the very best advice in the conduct of the competition. The assessors were Mr. H. S. Fairhurst, President of the Manchester Society of Architects; Professor C. E. Reilly, of Liverpool University; Mr. Francis Jones and Mr. John Swarbrick. It may be mentioned that Professor A. C. Dickie, of Manchester University was to have acted as one of the assessors, but withdrew from the jury for the reason that some of his own students entered for the competition. The first prize of £150 has been divided between Mr. J. I. Martin and Mr. J. Stanley Walkden, both third year students of the School of Architecture at Manchester.

MANCHESTER BUILDING TRADES EXHIBITION—ARCHITECTURAL DESIGN COMPETITION
FIRST PREMIATED DESIGN: J. L. MARTIN and J. STANLEY WALKDEN (Manchester University School of Architecture), Joint Architects.

University, while the second prize of £50 has gone to Messrs. Cooke and Harrison, of Gray's Inn Square, London.

The design placed first has all those qualities of neatness and simplicity which to-day are necessary for the winning of architectural competitions. Albert Square is very cleverly treated, advantage being taken of the existing alignments of the end façades to depart quite frankly from the rectangular formation, and to give to the garden space in the centre of the square curved frontages of an interesting shape, while the blocks on either side of the Avenue are canted so as to become roughly parallel to the boundary of the gardens opposite them. These latter are treated in a decorative manner, and if executed would form a pleasant addition to the square. The new façades comprise four blocks of almost identical pattern, and if there appears to be perhaps an insufficient attempt to differentiate between the blocks which perform the office of a gateway to the Grand Avenue and those which bound the Square at the ends of its longer axis, it must at least be acknowledged that the separate façades are in themselves pleasing and

sedate. The lay-out of the Grand Avenue is cleverly arranged, the centre part being devoted to a narrow strip of garden with trees on either side. The shopping frontage consists of an arcade with two wider intervals trisecting the length of the Avenue, and giving access to cross-roads. Above this arcade is a narrow terrace, surmounted by a façade of formal design.

The scheme placed second suffers a little from the undue repetition of its architectural features. The same steep-roofed pavilion provides the central feature of the blocks facing the Town Hall, and of the two others which enclose the ends of the Square, while in addition to that it is utilised to divide the façade of the Grand Avenue into its four parts. The steep roofs, with their double row of dormers, suggests that the building regulations of London County Council operate in Manchester also. The design, however, has a modern efficiency which would render it easy of execution. The organisers of the Manchester Building Trades Exhibition are to be congratulated on having instituted this competition, which has helped to promote the art of civic design.

Building News in Parliament

WESTMINSTER, Wednesday, April 6.

The second reading of the Architects (Registration) Bill is to be moved in the House of Commons on Friday, and the debate will probably occupy the greater part of the short sitting which precedes the rising of Parliament for the week-end. Among the supporters of the Bill are Sir Clement Kinloch-Cooke (who originally introduced it), Captain Fairfax, Sir Leolin Forestier-Walker, Mr. Hannon, Sir John Pennefather, Mrs. Philipson, and Colonel Watts-Morgan (a Labour Member). The next stage of the Bill will be in Grand Committee, when amendments can be debated. As Members depart for their Easter vacation on Thursday of next week, it is doubtful whether the proceedings in Committee will begin on this side of the holidays.

The debate which took place on the repairing of the fabric of the Houses of Parliament served the useful purpose of allowing certain misunderstandings to be cleared up. A resolution hostile to the Government's plans was moved by a Labour Member, Mr. Gardner, who declared that the proposed use of Stancliffe stone would be not only a great blunder when Portland stone was available, but that the Office of Works had failed to consult the Architectural Institute and the builders of the country. He elaborated at great length the point that Stancliffe stone had certain properties which made its use dangerous to the health of the workers engaged. He said there was not a single instance of Stancliffe stone being used in London. St. George's Hall, Liverpool, had been built of this material, but it was a sombre building which "looked like black ink," and he hoped the House would never agree to buildings of that kind disgracing the banks of the Thames.

This view, however, was not generally accepted by the House. The Marquis of Hartington said Stancliffe stone was warm and rich in colour, and that its durability was beyond reproach. Other Members expressed anxiety that the work of making the architecture of the Houses of Parliament worthy of a great tradition should not be commenced until expert opinion had been fully consulted, but Sir Douglas Newton declared that the House would gladly foot whatever bill was necessary.

The Government reply was made by Captain Douglas King, on behalf of the Office of Works. He declared that the Department had made full use of expert advice, and they had been acting all along, and intend to continue to act, under the guidance of the Fine Arts Commission until the restoration of the Houses of Parliament is completed. All questions of design and details, where alteration is involved, will be submitted to that body. He added that the subject of whether details of architecture in high elevations could be modified was under consideration. As to the stone, expert opinion was that Stancliffe was the most suitable and the best-wearing material that could be got. Portland stone was not considered to be a suitable material for the purpose, and the cost of it was considerably greater than that of Stancliffe stone. The majority of the House endorsed this statement by passing the Vote.

The Minister of Health reminded Members that under the Housing Act of 1924 a further reduction of the housing subsidy can be made in October, 1928. He said it was too early to form an opinion as to the propriety of a further lowering of the subsidy at that time, but he sees no reason to think that the reduction which has already been made has led to a decrease in the number of houses being built. The present rate of building is about 200,000 a year. In Mr. Chamberlain's opinion, this is very much in excess of the normal requirements and considerable progress is therefore being made towards reduction of arrears.

Legal Notes

Bovis Libel Action Result

At the resumption of the hearing, Mr. Ernest James Brown, one of the defendants, director of the Association, in evidence, said that after the trouble in the building trade in 1924 the Council of the Association formed a special committee to consider the question of wage stabilisation. By-laws were adopted, and another special committee was formed to carry out the procedure with regard to unfederated firms. Form "A" was sent to all members of the Association and to thirteen non-members, including Bovis, Ltd. Anyone who did not sign the form was declared to be in wage rate default if it was known that he was paying more than the standard wages. At a meeting of the special committee on March 23, 1925, at which three of the defendants were present, definite information was forthcoming that Bovis, Ltd., were paying more than the standard rate of wages, and it was decided to send them Form "B," which called on them to sign Form "A" within seven days. On April 8, no reply having been received from Bovis, Ltd., it was decided to declare that that firm was in wage rate default, and to circularise the members and others interested in building operations to that effect. The notice was sent to the members of the Association, to architects and quantity surveyors in the London area, to the secretary of the Surveyors' Institution that he might advise his members what course they should pursue in view of the crisis that had arisen, to the engineers of a number of big companies, and to public bodies such as the War Office, the Admiralty, the Office of Works, and the Air Ministry. He was not aware that at that time Bovis, Ltd., had posted a notice at their works that they were discontinuing payment of more than the standard wages. If he had known that he would have welcomed the news that they were coming into line with the other builders, and would have taken steps to stop the notice that the firm were in wage rate default. Witness had always treated Bovis, Ltd., as he would have treated his own members or any unfederated firm, and it was not true that the policy of the Association was actuated by a desire to get Bovis, Ltd.'s business.

His Lordship ruled that the publication of the alleged libel to members of the Association, to associated institutions federated with the members, to architects and to public bodies, was privileged. The plea of privilege, however, did not apply to a number of persons to whom the statement was made, who, he thought, had neither a duty nor an interest in the matter. As regarded a large part of the case, it was therefore necessary for the plaintiffs to establish malice.

The jury found that the words complained of were a libel upon the plaintiffs, and were not true, but that in publishing them the defendants were not actuated by malice. In respect of the publication of the libel upon occasions that were not privileged, they awarded £25 damages. Judgment was entered accordingly.

His Lordship refused the plaintiffs' application for an injunction, saying he was not satisfied that defendants had any intention of repeating the libel.

The question of costs upon the issue of malice was left for argument on Wednesday.

The first of the Cecil Houses, to provide lodging-house accommodation for women, was opened by the Lord Mayor of London, on Monday last, at 35 Devonshire Street, Bloomsbury. The house is of the Queen Anne period, and has been repaired and adapted under the direction of Mr. Ralph Knott, the honorary architect, the cost, including purchase, being £3,800.

MANCHESTER BUILDING TRADES EXHIBITION—ARCHITECTURAL DESIGN COMPETITION FOR A PROPOSED GRAND AVENUE AND MAIN APPROACH TO ALBERT SQUARE IN THE CITY OF MANCHESTER. SECOND PREMIAED DESIGN. MESSRS. COOKE & HARRISON, Architects.

New Ways and Means

*The Editor will welcome early information of
New Plant, Materials and Fittings*

A Priming with a Dual Purpose

A transparent pigmented priming which can be brushed or sprayed, and is of a suitable nature for filling and coating the work in one operation, has just been placed on the market by Messrs. R. Gay & Co., Ltd., of Langthorne Works, Stratford Market, London, E.15. This product, which has been named "Filcote," has an elasticity similar to that of size, but is prepared from varnish and paint ingredients. When used on wood it does not raise the grain; in the case of a hard close grain wood one coat will suffice to give a proper foundation for the subsequent application of varnish, but on hard open grain wood a certain amount of preliminary filling may be necessary. For this purpose "Antipore," another speciality made by R. Gay & Co., Ltd., is recommended. The use of "Filcote," however, is not restricted to wood, for it can be used with equal success upon wallboards, plaster walls and canvas. In each of these cases it will seal the pores, leaving a hard surface which is free from suction. Applied to sheet metal, such as zinc or galvanised iron, it will also give an adequate key for subsequent coats of paint, but it cannot be used as an anti-rust preparation. The covering capacity of this product is, of course, dependent upon the surface under treatment, and varies between the extremes of 50-100 square yards per gallon. A demonstration of its unique filling and coating properties was held this week at the manufacturer's works, one of the surfaces under treatment being ordinary blotting paper, the pores of which were completely sealed, giving a surface to which either paint or varnish could be applied. The perfect key which this material provides for the direct application of paint was also demonstrated, as well as the advantages secured by its use in conjunction with under-coating.

The "White Rose" Sectional Boiler.
(Hartley & Sugden, Ltd.)

The "Agrippa" Manhole Cover.
(Broad & Co. Ltd.)

An Improvement in Manhole Covers

A new type of seating for circular manhole covers, designed to prevent the rotation of the cover in its frame and to eliminate "rocking," has been embodied in manhole fittings made by Messrs. Broad & Co., Ltd., of 4 South Wharf, Paddington, London, W.2. This seating, which is patented, consists of a series of short inclined planes and vertical abutments formed in the seating of the frame, and coinciding with corresponding faces in the bearing rim of the cover, so that in practice, under the stress of traffic, the cover is forced down into the seating of the frame and is securely "locked" against any form of movement. This new principle has been used in the construction of the "Agrippa" Cover (for roads paved with sets or wood blocks) and the "Dome Agrippa" (for macadam or concrete roads). Both of these units are made in standard sizes, but can be cast to order in any special size or weight.

A New Boiler for Central Heating

A new "White Rose" Domestic Boiler for central heating, constructed in sections, with all the heating surface directly exposed to the fire, and with every part of the waterway accessible for cleaning, has been placed on the market by Messrs. Hartley & Sugden, Ltd., of Halifax, and of 88 Great Portland Street, London, W.1. This boiler is cast from semi-steel, and the individual sections are connected together with machined taper push nipples and long tie bolts. It is provided with very wide waterways, which are carried beneath the grate to ground level, with provision for the easy removal of sediment deposited from hard water. It can be supplied with any number of sections from three to eight, giving a boiler heating surface of from 11.9 to 27.9 square feet, which for central heating is equivalent to 375 to

875 square feet of direct radiation 53,550 to 125,500 B.Th.U. per hour. The sections are tested to 75 lbs. per square inch hydraulic pressure, and for districts where the water is soft they can be treated by the Bower-Banff rustless process. In one of our illustrations the front section of the boiler has been removed, showing the details of firebox, waterways, and firebars.

A New "All-Insulated" Switchplate

Messrs. J. H. Tucker & Co., of King's Road, Tyseley, Birmingham, have just introduced a series of switchplates moulded in "Telacite," a new material with high insulating properties, and one which is unaffected by sea air or polluted atmospheric conditions. The surface of these switchplates is finely cross-cut, giving a refined matt finish of a bronze-brown colour which will harmonise with almost any decorative scheme. A novel method for fixing the plate to the switch has been adopted, dispensing with the need for switch rings, which are replaced by screws carried into small brass plates mounted on the switch bridge.

A New Weatherproof Reflector

Messrs. Marryat and Place, of 40 Hatton Garden, London, E.C.1, have now added to their standard "Interzone" Industrial Reflectors (introduced as a means of removing hard shadows and glare with a reflector) one which is waterproof and resisting to deterioration in the presence of steam or acid fumes. With this new fitting, an enclosing cover of metal, normally recommended for weatherproofing, can therefore be dispensed with.

London Building Notes

BAKER STREET.—A row of premises is to be erected on a site in Baker Street, W.1. The builders are Messrs. Harry Neal, Ltd., Northwood, Middlesex. The plans have been prepared by Mr. George Vernon, 60 Portland Place, W.1. Steelwork will be supplied and erected by Messrs. Redpath, Brown & Co., Ltd., 3 Laurence Pountney Hill, E.C.4.

BARNES.—A scheme involving structural alterations and repairs is to be effected to the Barnes Theatre, near Roehampton, S.W. The plans have been prepared by Messrs. Birdwood & Mitchell, 80 George Street, Portman Square, W.1, the owners being Messrs. Palaseum, Ltd.

BASINGHALL STREET.—An extensive area at the junction of Basinghall Street and Gresham Street, E.C.2, is now being cleared to provide for the erection of another office building. The plans have been prepared by Messrs. Robert Angell & Curtis, 133 Regent Street, W.1, whilst the building work will be carried out by Messrs. George E. Wallis & Son, Ltd., Maidstone and London.

BRIXTON.—The premises of Messrs. Quin & Axtens, Brixton Road, are to be rebuilt and set back on a new frontage line. The building has been designed by Mr. H. Payne Wyatt, architect, 465 Brixton Road, S.W., on the instructions of Messrs. Selfridge Provincial Stores, Ltd. The builders are Messrs. A. & F. Leather, 17 Victoria Street, Westminster, S.W.1. The elevation will be in terra-cotta, supplied by the Leeds Fireclay Co., Ltd., Leeds.

BRIXTON.—Work is about to be commenced upon the erection of the large "Brixton Astoria" in Brixton Road, S.W. The architect is Mr. E. A. Stone, F.S.I., 20 Berkeley Street, W.1. The builders are Messrs. Griggs & Son, 100 Victoria Street, Westminster, S.W.1.

CATFORD.—A site at Rushey Green, S.E., has been allocated by a syndicate for the erection of a picture theatre. The plans having been prepared by Mr. E. A. Stone, F.S.I., 20 Berkeley Street, W.1. The builder is Mr. James Watt, 1 Central Parade, Bromley Road, S.E.

CLAPHAM.—The Electric Pavilion at Lavender Hill, Clapham, S.W., is to be enlarged by the addition of a cantilever gallery and a lounge and crush hall. The plans have been prepared by Messrs. Frank Matcham & Co., 9 Warwick Court, High Holborn, W.C.2.

CORK STREET.—Foundations are being placed for a building to be erected on a frontage in Cork Street, W.1, to consist of shops on the ground floor with offices or flats above. The plans have been prepared by Mr. Gervase Bailey, F.R.I.B.A., Kings Buildings, Smith Square, S.W.1. The builders are Messrs. C. F. Kearley, Ltd., 4 Great Marlborough Street, W.1.

LEICESTER SQUARE.—The "Leicester Lounge" public-house at the corner of Leicester Square and Wardour Street, W.1, is at present being reconstructed

as an extension to the premises of Messrs. Stagg & Russell, Ltd., drapers, etc. The work is being carried out by Messrs. Frederick Sage & Co., Ltd., 58 Gray's Inn Road, W.C., under the direction of the architects, Messrs. Herbert O. Ellis & Clarke, 3 Old Queen Street, Westminster, S.W.1.

PECKHAM.—Plans have been approved for the gutting and remodelling of the interior of the Crown Picture Theatre in Peckham High Street, S.E., owned by Messrs. Biocolor, Ltd. The architect is Mr. E. A. Stone, F.S.I., 20 Berkeley Street, W.1.

REGENT STREET.—Foundation work is in progress on the site of Nos. 56-62 Regent Street, W.1, where a rebuilding scheme is about to be put in hand. Plans have been prepared by Messrs. Yates, Cook & Darbyshire, 43 Great Marlborough Street, W.1. The builders are Sir Lindsay Parkinson & Sons, Ltd., Lindsay House, Shaftesbury Avenue, W.

REGENT STREET.—A new office building is to be erected on the site of No. 16 Regent Street, W.1, under the reconstruction scheme of H.M. Office of Woods and Forests. The builders are Messrs. Bovis, Ltd., 43 Upper Berkeley Street, W.1, whilst the steel frame will be fabricated by Messrs. Moreland, Hayne & Co., Ltd., 80 Goswell Road, E.1. The architect is Mr. J. J. Joass, F.R.I.B.A., 40 St. James's Place, S.W.1, and the quantity surveyor is Mr. Ernest Babbs, 40 St. James's Place, S.W.1.

SOUTHWARK.—A grant is to be made towards the proposed enlargement of St. Saviour's and St. Olave's School for Girls, at New Kent Road, S.E.1, projected by the Governors. The total cost of the new buildings is estimated by the architects, Messrs. J. Campbell, Jones, Son & Smithers, 9 Dowgate Hill, Cannon Street, E.C.4, at £20,000.

ST. PANCRAS.—The St. Aloysius Church Council, Somers Town, N.W.1, have in view the erection of a church school on an adjacent site to the church. The cost is estimated at £17,000. Plans have been prepared by Mr. T. H. B. Scott, 11-12 Finsbury Square, E.C.2.

THOMAS STREET.—A factory building is to be erected in Thomas Street, E.14, by Messrs. Sanders Bros. (Stores), Ltd. The architects are Messrs. Higgins & Thomerson, 9 Finsbury Square, E.C.2.

TOTTENHAM.—A public-house is to be built on a site in White Hart Lane, Tottenham. The new hotel will be erected by the Improved Public House Co., Ltd., 15 Red Lion Street, W.C., to the designs of Mr. E. C. P. Monson, F.R.I.B.A., Finsbury Pavement House, Moorgate, E.C.2.

WANSTEAD.—A sanatorium for animals is to be erected on a site known as St. Swin's Farm, at a cost of about £40,000. Buildings and stables, with accommodation for staff, etc., are to be erected, to the plans of Messrs. A. & V. Burr, F.R.I.B.A., 85 Gower Street, Bloomsbury, W.C.

WEALDSTONE.—A row of 14 shops with flats over for living accommodation is to be erected upon a site in Station Road, on a frontage of some 240 feet. The builder is Mr. H. B. Silver, 105 Harrow View, Harrow.

Building Materials

The Inter-Departmental Committee appointed to survey the prices of building materials have submitted to the Minister of Health and the President of the Board of Trade a schedule showing the prices during the month of February. For purposes of comparison, the schedule, which was issued recently (H.M. Stationery Office, price 4d. net), includes also prices for April, 1914, and January, 1924. The Chairman, Major J. W. Hills, M.P., reporting on behalf of the Committee, states that their last schedule, which included prices for the month of November, revealed marked advances in the prices of bricks, both common and facing (but excluding Flettons), cement, cast-iron goods, glazed ware, and tiles. These advances were attributable to the increased cost of fuel consequent on the coal stoppage. After the lapse of three months, during which conditions may be said to have become more normal, prices as regards bricks have moved downwards in most districts, but it is noteworthy that the level of prices, with few exceptions, still remains higher than before the coal stoppage. On the other hand, the price of Portland cement is now, in most districts, practically back to the level of last May, but lime, though generally cheaper, still shows increases ranging up to 17s. per ton. Falls of varying amounts are recorded in the prices of cast-iron goods and glazed ware, but here again most articles in these categories are still dearer than in May last. Exceptions, however, are rain-water goods and soil-pipes in Scotland, and baths in Leicester, Manchester and Scotland, the prices of which compare favourably with those ruling nine months ago. No reduction has taken place in tiles, the prices of which compare favourably with those ruling nine months ago. No reduction has taken place in tiles, the prices of which remain at the level reached in November. As regards other articles, timber shows a tendency to rise in some districts. Lead, however, which has now been declining in price for several months, shows another marked decrease, amounting in Scotland to as much as £8 to £8 10s. per ton for sheet lead, and £6 to £6 10s. per ton for lead piping. The Committee have formed the opinion that, having regard to the general high level at which the prices of certain articles continue to be maintained, further investigation is called for. A sub-committee has accordingly been appointed to inquire into the reasonableness of present prices, so far as is consonant with the terms of reference to the Committee. It is proposed to investigate, first, the price of bricks, and to deal later with other materials.

The Hall Mark of Your Craftsmanship

THERE are many cases where compactness in Switch Design is a virtue in itself—there are many cases where, from reasons of cost, an ability to control as heavy a load as a larger size switch makes the "Crabtree" Junior equal—and in fact superior—to many 5-amp. Switches on the market.

* * *

To have maintained the fundamental principles of the "Crabtree" Switch with its many advantages, and to condense these into a Switch the base of which is only 1 3/4 in. in diameter, is no small achievement.

* * *

Used in conjunction with the semi-recessed Teak Switch Block it forms a typical example of the neat, compact craftsmanship of

"Craftsmen in Electrical Switches."

A SUGGESTION

MAY we suggest that before purchasing Fireplace Suites or Sanitary Appliances you and your Clients should visit our recently re-arranged Showrooms at 17 & 18 Upper Thames Street, London, E.C.4.

The range of Fireplace Suites offered for inspection is a very wide one. A special feature is the number of beautiful Period Designs, many of which we owe to our own craftsmen of a century ago.

The Register Grate illustrated is in Armour Bright finish and fitted with the Hot Hearth Fire. It is particularly suitable for office or country house use.

The Week's Building News

The following abbreviations are used: U.D.C. for Urban District Council; T.C. for Town Council; R.D.C. for Rural District Council; E.C. for Education Committee; B.G. for Board of Guardians; P.C. for Parish Council; B.C. for Borough Council; M.H. for Ministry of Health; M.T. for Ministry of Transport; C.B. for County Borough; B.E. for Board of Education. Direct confirmation should be obtained before commitments, for which we cannot be responsible, are made.

ALTRINCHAM.—Altrincham General Hospital extensions. Mr. T. Harold Hill, A.R.I.B.A., 1 Market Street, Altrincham, Ches., is the architect. No contracts have been placed.

BACUP.—A new church for St. Joseph's, Stacksteads, Bacup, is to be erected. The cost will be £5,699 10s. Mr. R. Byrom, A.R.I.B.A., Silver Street, Bury, is the architect. The contract has been placed with Messrs. Mullen & Durking, Ltd., 146 Trafalgar Street, Burnley.

BIRKENHEAD.—The Corporation proposes to recondition and repair Queens Buildings, otherwise the Dock Cottages, at a cost of £36,517.

BIRMINGHAM.—A new church of the Holy Family is to be erected at Small Heath, Birmingham. Mr. George Drysdale, of Messrs. Stokes & Drysdale, F.F.R.I.B.A., 17 Buckingham Street, Adelphi, London, W.C.2, is the architect.

BIRMINGHAM.—Subject to approval, the E.C. is to erect the third block of the new Council School at Hastings Road, Perry Common, at a cost of £20,500.

BIRMINGHAM.—A new church is to be erected at Dad's Lane Estate, Stirchley, and the plans by Mr. S. N. Cooke, F.R.I.B.A., have been accepted.

BIRMINGHAM.—The contract for the new cinema to be erected in Icknield Port Road, Birmingham, has been placed with Messrs. T. Elvin & Son, Soho Hill, Birmingham. The new theatre will cost in the region of £40,000. The architect is Mr. Harold S. Scott, A.R.I.B.A., 115-117 Colmore Row, Birmingham. Messrs. Stanley Horrex & Taylor, 83 Colmore Row, Birmingham, have in hand the development of the Croftdown Estate, Harborne, Birmingham. All contracts are open for these houses, and no tenders have yet been invited.

BLACKWOOD.—A Wesleyan church is to be erected, at a cost of £12,000.

BOLTON.—The Corporation have passed plans submitted by Messrs. G. E. Tong & F. Holt for the erection of a picture house at Churchgate, Bolton.

CADISHEAD.—Institute extension, St. Mary's, Partington. Messrs. J. Bowden & Co., 14 Ridgefield, Manchester, are the architects. The contract has been placed with Messrs. Brew Bros., Cadishead.

CHERTSEY.—The M.H. has approved the proposed erection of 100 houses by the U.D.C.

CLITHEROE.—In connection with the erection of a new bank at Market Place, Clitheroe, for Messrs. Barclays Bank, Ltd., of London, the contract has been placed with Messrs. John Bleazard & Sons, Railway View, Clitheroe. The stonework will be supplied from the John Greenwood Quarries, Glossop.

CREWE.—The hospital is to be extended, at an approximate cost of £15,000.

DEWSBURY.—A new block of business premises is to be built on a site at Northgate, Dewsbury. Messrs. North, Robin & Wilsdon, of 35-39 Maddox Street, London, W.1, are the architects.

EASTBOURNE.—Plans passed: Fourteen houses, St. Anthony's Avenue, for Mr. S. G. Seales, architect.

GLASGOW.—Among the plans for which linings were granted recently at Glasgow Dean of Guild Court were those for the new housing scheme at Bilsland Drive. The plans were for 340 houses of three apartments and 168 of four apartments, as well as for 12 shops. Linings were also granted to the Salvation Army to erect a hall in Kelvin Street, Partick; to James Templeton & Co., to erect a factory in William Street; and to the Strathclyde Cinema Co., to erect a picture house in Summerfield Street.

HADDINGTON.—The Scottish Board of Health have approved of the erection of houses at Pencaitland, Dirleton, Longniddry, Ormiston, Macmerrie, Aberlady, and East Saltoun, at a total cost of £4,180.

HARROGATE.—The site for the new Harrogate Infirmary will be in Knaresbro' Road. The cost of the new building is estimated at something like £80,000.

HEMWORD.—Mr. F. Partridge, 1 Hague Terrace, Hemworth, near Pontefract, is proposing to erect a new Palais-de-Danse at Hemworth. Mr. R. Goodworth, 5 Market Hill, Barnsley, is the architect. No contracts have yet been placed.

HULL.—The Corporation Mental Hospital Committee have approved revised plans of the City Architect for the admission hospital and nurses' home at the Mental Hospital.

KENDAL.—Mr. W. L. Dolman, architect, of Windermere, is to erect 12 houses at Heron Hill, Kendal, for Messrs. Somervell Bros., Ltd.

LEYLAND.—The Council is to erect two lots of 20 houses to be let, and another 20 for sale.

LEEDS.—The Improvements Committee recommended that the amended design of Sir Reginald Blomfield be approved for buildings to be erected on the site at the corner of Guildford Street and Cookridge Street, proposed to be transferred to the Leeds Permanent Building Society.

LEEDS.—Plans passed: Mark Bristow, 18 semi-detached houses (plots 1 to 19), Stainbeck Road; Ernest Todd, 22 houses, Marsden Avenue and Grove, Beeston; A. E. Collett, 12 semi-detached houses, Lincroft Estate, Broad Lane, Bramley; J. Pullan & Sons, Ltd., 32 houses (Blocks 24 to 31), Firth Avenue and Grove, and Theodore Street, Beeston; F. Reddyhoff & Son, 14 semi-detached houses (plots 9 to 22), Potternewton Crescent, Scott Hall Road.

LIVERPOOL.—The London Midland and Scottish Railway propose to erect

a new laundry at the Adelphi Midland Hotel, Liverpool. The plans have been prepared by the company's architect, and the building is estimated to cost £18,000. The contract has been placed with Messrs. Hughes & Stirling, 4 Brazenose Street, Bootle, Liverpool.

LLANTARNAM.—The U.D.C. have received sanction to borrow the necessary money for erecting 280 houses and to commence building immediately.

MANCHESTER.—Mr. E. J. Kewell, architect, 290 Oxford Road, Chorlton-on-Medlock, Manchester, has prepared a lay-out and plans for the erection of 20 houses on the Worsley Avenue Estate, Moston, Manchester, for Mr. W. H. Coupe, who is the builder.

MANCHESTER.—For the erection of the new office block for the English Sewing Cotton Co., Ltd. Mr. H. S. Fairhurst, F.R.I.B.A., architect, 48 Brown Street, Manchester, has been commissioned to prepare the plans. No contracts have yet been placed.

MANCHESTER.—Messrs. A. K. Dyson & Co., 86 George Street, Manchester, are proposing to make alterations to their premises. The plans have been prepared by Messrs. J. W. Beaumont & Sons, F.F.R.I.B.A., architects, 24 Brazenose Street, Manchester. The contract for the building work has been placed with Messrs. Robert Carlyle & Co., Ltd., Elsinore Road, Old Trafford, Manchester. Lift supplied by Messrs. Etchells, Congdon & Muir, Ltd., Manchester.

MANCHESTER.—The Patent Knitting Co., Ltd., 255, Ashton Old Road, Ardwick, Manchester, have acquired premises at Baden Street, Higher Ardwick, Manchester, which they propose to adapt for their business. Mr. J. Percival, Commercial Buildings, Blackfriars Street, Manchester, is the architect. The contract has been placed with Mr. Thomas Mottershead, Dewnap Street, Ardwick, Manchester.

MANCHESTER.—The Rusholme Builders (Manchester), Ltd., 89 Wilmslow Road, Rusholme, Manchester, have acquired a site at Folkestone Road, Clayton, Manchester, where they propose to erect five shops and offices. The plans have been prepared by Messrs. Dixon, Hill & Co., architects and surveyors, 240 Royal Exchange, Manchester, and at Oldham. Electric light, plastering, painting and plumbing will be let by contract.

NEWCASTLE.—New police and fire brigade stations and police courts are to be erected in Pilgrim Street, Newcastle, at an estimated cost of £125,000.

NEWCASTLE.—Messrs. Nordmann & Sons, Ltd., are to erect 14 houses on the High Heaton Housing Estate, at a cost of about £5,800.

NEW SWINDON.—The Co-operative Society have under consideration the erection of a shop and extensions in various departments involving an expenditure of £39,000.

SOME TRADITIONS OF
THE PLASTERER'S CRAFT

Drawn by D. M. Cafferata.
Historical data by George Bankart.

RAPHAEL'S foremost worker in stucco was Giulio Romano. He, with his artisans, are shown working on the façade of the Palazzo del Té, with the stucco invented by Giovanni Manni da Udine.

The plastic and durable qualities, only obtained when the mortar had matured for several years, are immediately evident in a stucco mixture of sand and Portland cement with a small proportion of

The word 'PUDLO' is the registered Trade Brand of Kerner-Greenwood & Co. Ltd., by whom all articles bearing that Brand are manufactured or guaranteed.

RAINHAM.—The Rainham Co-operative Society is to erect shops and an assembly hall. Operations are to commence at once.

RISCA.—Two hundred houses are to be built on the Ty Isaf Estate by the Allied Building Corporation.

RISHWORTH.—Plans have been prepared by Messrs. Walsh & Maddocks, of Halifax, for the erection of a village church for the parish of Rishworth.

ROTHERHAM.—The B.E. have approved of a site at Maltby for the erection of a secondary school.

ROWLEY REGIS.—The U.D.C. are to erect 50 parlour type houses and 64 non-parlour type houses on the Twidale Hall Estate. The plans have been prepared by Mr. Stanley Griffiths, the architect.

SHEFFIELD.—The Corporation Estates Committee have instructed the city architect to proceed with the erection by direct labour of about 20 three-apartment bungalows, at an estimated cost of £325 each, at Ridgeway Road.

SHEFFIELD.—The Sutton Trustees are to erect 175 houses on the Wadley Hall Estate, Sheffield. The architect is Mr. F. L. Sargent, 51 Corn Street, Bristol.

SHOTTON.—A new Catholic school at Shotton will cost about £6,000. The contractors are Messrs. John Williams, Ltd., of 70 Collingwood Street, Liverpool, who are carrying out the work to the plans of Mr. A. Gilbertson, architect, 15 Tithebarn Street, Liverpool.

SOUTH ELMSALL.—A Roman Catholic Church is to be erected at Moorthorpe, South Elmsall, at a cost of £8,000.

STOURBRIDGE.—The British Legion propose to erect two houses in each county for the occupation of ex-Service men.

WESTBURY-ON-TRYM.—An area of about 126 acres has recently been sold to Mr. E. N. Eskell, of 20 Park Street, Bristol, representing the purchaser. The intention of the purchaser is to commence developments forthwith, and the lay-out is now being prepared for the erection of modern residential properties, each house having all modern adjuncts, including garage, and occupying a quarter or a half acre of land. The plans will shortly be ready for inspection.

WOLVERHAMPTON.—The Hospital Committee has decided to immediately erect a maternity hospital, septic block, a new laundry, and a nurses' home, at an estimated cost of £25,000 to £28,000.

WORKSOP.—Priory Church improvement scheme. The plans have been prepared by Mr. Harold Brakspear, F.S.A., A.R.I.B.A., architect, High Street, Cosham, Wilts, which provide for rebuilding of the choir and central tower.

WORMHOLT.—The L.C.C. recommend that, subject to the consent of the M.H., two plots of land on Wormholt estate, Hammersmith, be let on building lease to Mr. R. J. Jones for the erection of about 22 shops.

YORK.—Approval has been received to the erection of 38 and 12 houses on the Glen Road and Tang Hall No. 1 Estates respectively, and to the erection of 42 houses on the Tang Hall Estate No. 2. The City Engineer is

to report at the next Council meeting on tenders for 74 houses on Tang Hall, 30 for the Health Committee and 42 for the Housing Committee.

Training of Building Apprentices

The Directors of Education, Education Offices, Manchester, desire to bring to the notice of employers and parents the facilities which are available in Manchester for the training of apprentices in the building and allied trades.

(1) The Mill Street School for Building Trade Apprentices, Ancoats, Manchester (day classes). No fees are charged in respect of attendance at this school, and apprentices may enrol immediately on personal application at the school. The apprentices attend for one day per week, and pass out from the school as follows: Bricklayers and masons (at 18 years), to evening courses at the College of Technology; joiners (at 18 years), to carpentry and joinery evening course at the College of Technology; plumbers (at 16 years), to plumbing course (day or evening) at the College of Technology; plasterers, painters, and decorators (at 16 years), to painters' and decorators' course at the School of Art.

(2) The School of Art (day and evening classes): Employers and parents are advised to consult the School of Art Calendar respecting the facilities offered for the education and training of plasterers, aged 16 years upwards; painters and decorators; architectural students. There is also a special pamphlet dealing with the School of Architecture.

(3) The College of Technology: (a) Particulars of the full-time (three years' course) in building technology will be found in the College of Technology prospectus of full-time day courses. (b) Full details of the part-time day and evening courses for: (1) structural engineering; (2) reinforced concrete engineering; (3) building; (4) quantity surveying; (5) building surveying; (6) woodcutting machinists; (7) carpentry and joinery, will be found in the College of Technology special building prospectus of part-time classes. (c) Details of the following courses: (a) Apprentice day course for plumbers; (b) evening courses in municipal engineering; (c) sanitary engineering; (d) town planning; (e) heating and ventilating engineering; (f) plumbers' work; (g) sanitary inspection; (h) sanitation; (i) chemical lead-burning, will be found in the College of Technology special prospectus of part-time classes in municipal and sanitary engineering.

(4) Branch Technical Evening Schools: There are classes in building trade subjects in certain of the branch technical evening schools, details of which will be found in the short prospectus of evening schools which is published shortly before each winter session.

Further particulars may be obtained from the Director of Education, Education Offices, Deansgate, Manchester.

London Building Notes.

EDMONTON.—The Edmonton Latymer School, E., is to be extended, at a cost of over £70,000. The plans have been prepared by Mr. H. G. Crothall, F.R.I.B.A., Middlesex Guildhall, Westminster, S.W.1. The builders are Messrs. H. Knight & Son, 16 Bruce Grove, Hackney, N.17.

PADDINGTON.—Work has commenced on the site at the corner of Porchester Street, W., where it is proposed to erect a public hall and library, at a cost of about £100,000. Plans have been prepared by Mr. Herbert Shepherd, 80 Queen's Road, Bayswater, W.2. The builders are Messrs. Perry & Co. (Bow), Ltd., 56 Victoria Street, Westminster, S.W.1.

SLOANE SQUARE.—A start is to be made with the work of reconstructing the station at Sloane Square, S.W., owned by the London Electric Railways Company. The new buildings have been designed by the company's architects.

SOUTHAMPTON ROW.—Messrs. Dorman, Long & Co., Ltd., Central Buildings, Westminster, S.W.1, are erecting the main girders and framework for the second portion of the headquarters office building to be erected in Southampton Row and Bloomsbury Square, W.C., for the Liverpool Victoria Friendly Society. The contractors, Messrs. J. Carmichael (Contractors), Ltd., Wandsworth, S.W., are now constructing the foundations. The architect is Mr. C. W. Long, 36 Bloomsbury Square, W.C.1.

WESTMINSTER.—The L.C.C. are applying for powers to provide for the erection of additional buildings at the County Hall, S.E.1. The east wing still remains to be erected, for which foundations were constructed recently at a cost of £70,000. The architect to the County Hall is Mr. Ralph Knott, F.R.I.B.A., Adelphi Terrace, House, W.C.

WESTMINSTER.—Messrs. George Trollope & Sons, surveyors, have disposed of the freehold of Nos. 1 and 2 Old Rye Street, S.W.1, which covers an area of about 3,300 square feet. The property has been acquired by the Wardens of St. Matthews Church adjoining, who propose to extend their school buildings.

WOOD STREET.—Messrs. Galbraith Bros., Ltd., 63 Waterloo Street, S.E.5 have commenced on their contract for the erection of the superstructure of the "Metropolitan" Telephone Exchange in Wood Street, E.C.2. The building will be the largest telephone exchange in London, being 8 storeys high. The plans have been prepared by Mr. R. J. Allison, F.R.I.B.A., chief architect to H.M. Office of Works.

Birmingham Building Exhibition

A preliminary prospectus states that the Birmingham and Midland Building and Allied Trades (including Public Works and Road Making Section) will be held this year at Bingley Hall, Birmingham, from September 1 to September 17.

Particulars from The Birmingham and Midland Building and Allied Trades Exhibition, Chamber of Commerce, 95 New Street, Birmingham.

THE TRUSCON FLOOR

IN REINFORCED CONCRETE

THE MEDICAL SCHOOL, CARDIFF.

Architect: J. B. FLETCHER.

Contractors: E. TURNER & SONS, LTD.

TRUSCON FLOORS WERE CONSTRUCTED THROUGHOUT.

The adaptability of the Truscon floor has been demonstrated in the above building, and a further interesting and distinctive feature should be mentioned. In this instance the Truscon floors were designed to allow of the very many drainage channels from laboratory sinks being run in the thickness of the floor direct to the outlet pipes on the exterior walls.

It is the primary duty of a floor to carry efficiently the loads which may come upon it. Of the other duties of a floor the least spectacular, but the most useful, is that of accommodating the "domestic services." The Truscon floor will do this.

Most buildings require gas and electric light, electric bells, telephones, and water supply. Heating systems, either radiator or "panel," have to be allowed for, and sprinklers or ventilating systems are often required. The Truscon floor has an accessible hollow space in which all these services can be effectually concealed.

NEWCASTLE.—The Corporation have accepted the tender, £11,403, of Mr. J. S. Hetherington, for the erection of 29 brick houses in Walker Road.

OLDBURY.—For the erection of 46 houses on the Londonderry Farm estate, and 4 houses (brick built) in Bristnall Hall Road and Bristnall End Lane, for the U.C. Mr. W. Greenwood, M.I.M.&Cy.E., Surveyor to the Council. Housing, Ltd., Blackheath, near Birmingham, £20,998 (accepted).

PLYMOUTH.—The Corporation have accepted the tender, £2,750, of Plymouth Builders, for the erection of six additional three-storied flats at Pottery Quay.

PWLLHELI.—Seven tenders were received by the Council for the third housing scheme of 20 dwellings. The three lowest tenders were: Daniel Owen, Nywytho, £10,405 10s.; Jones & Evans, Pwllheli, £10,621 10s.; and Williams & Evans, Abersoch, £11,019 10s. The first-named was accepted.

SALFORD.—The Housing Committee have accepted the amended tender of the Exors. of Elijah Murphy, Moston, £9,380, for the erection of 17 houses on the Weaste housing estate.

SHEFFIELD.—The tender of Messrs. R. Charlesworth, Ltd., for the erection of a pavilion and tearoom at Graves Park, for the Sheffield Corporation, at £2,704 13s. 3d., is recommended for acceptance. The tender of Messrs. M. J. Gleeson, Ltd., for the erection of 20 houses on the Longley Estate, for the Corporation, has been accepted.

SHEFFIELD.—The Corporation recommend the tender of Messrs. J. Middleton, Ltd., for the erection of conveniences and shelter at the Ecclesall Tram Terminus for £1,470.

SHOTTON.—For the erection of new schools at Shotton for Rev. Father Eadsforth. Architects, Mr. A. Gilbertson, 15 Tithebarn Street, Liverpool. John Williams (Liverpool), Ltd., Liverpool (accepted).

ST. HELEN'S (I.O.W.).—The T.C. propose purchasing a site in Harding Road, Oakfield, for the erection of 20 houses, and the tender of Messrs. Sadler & Co., Dollis Hill, London, has been provisionally accepted at £8,910 1s. 8d.

SUSSEX.—For alterations and additions to offices and clubroom at Lewes, Sussex, the tender of Messrs. The Ringmer Building Works has been accepted. Mr. E. H. Fuller, architect.

TIPTON.—For the erection of 16 non-parlour type houses in Park Lane West for the U.D.C. Mr. Horace N. Woodward, surveyor. Messrs. W. Willetts & Sons, accepted at £4,560.

UXBRIDGE.—Middlesex E.C. recommend the tender of Messrs. Y. J. Lovell & Son, Gerrards Cross, £11,474, for the erection of a new block at the Whitehall Council School, Uxbridge.

WALSALL.—The T.C. have accepted the following tenders: Messrs. W. Kendrick & Son, for the erection of 203 houses (46 parlour type and 157 non-parlour type), at £83,221; Mr. J. R. Deacon for 20 houses (8 parlour type and 12 flats), at £13,030.

WEMBLEY.—Middlesex E.C. recommend the tender of Messrs. C. J. Newby & Bros., of Southgate, £15,790, for the erection of an elementary school in East Lane, Wembley.

WEST LANCASHIRE.—The R.C. has provisionally accepted tenders for 20 more houses, making 52 in all.

WESTMINSTER.—The L.C.C. E.C. have accepted the tender of Alan V. Goad, Camberwell Road, £875, for the provision of a new scullery, etc., at the L.C.C. Westminster Technical Institute.

Rawlplug Competition

An interesting competition has recently been announced by Messrs. The Rawlplug Co., Ltd., Rawlplug House, Cromwell Road, London, S.W.7. Numerous prizes are offered, the 1st, 2nd and 3rd being £50, £20, and £10 respectively. Full details of this competition, which any user of Rawlplugs has an equal chance of winning, will be found in our advertisement pages.

Satisfied

Client : Well, I must say I'm more than satisfied. I'm delighted. It's a fine, clean-looking job, and the flat roof is perfect. I congratulate you both.

Architect : Thanks very much.

Builder : Thanks also. But my part was easy. The idea is everything, and I worked from an excellent specification. That VULCANITE roofing is new to me but I like the look of it, and the roofers who laid it were experts. I watched them with interest.

Architect : It's wonderful stuff altogether. Watertight and fire-resisting too. In this case it is covered with $\frac{1}{2}$ -in. tar macadam, though sometimes I specify it to be covered with sand and gravel, which keeps the building beneath at an equable temperature, warm in the winter and cool in the summer.

Client : Well—it will need to be tough to stand up to its job as a recreation ground as well as a roof!

Architect : I'm not afraid of VULCANITE letting me down. It never has done, and I've advised it in a great many cases now. I'm always surprised that VULCANITE is so inexpensive. It is the best and least expensive material for flat roof covering.

"VULCANITE" roofing is used under the London Building Act and the Bye-laws, etc., of all Borough and Urban District Councils; and is accepted by all the leading Fire Insurance Companies as an Insurance Tariff Roof

We shall be pleased to have your request for our Illustrated Booklet, and to supply detailed drawings and estimates free.

VULCANITE FLAT ROOFING is supplied and fixed only by

"Beauty begins where the
light comes in"

Specify PLATE GLASS for Windows

You are then certain that the Glazing of the house will be in accordance with the rest of your architectural plan, in keeping with the degree of richness, dignity, beauty and desirability you have in mind.

Plate Glass, as the pre-eminent glazing, is being advertised to the public, who are learning to appreciate the value of Plate Glass for the windows of their houses.

Plate Glass is a non-conductor of heat, it is practically sound proof, and less liable to breakage. Its brilliant, polished surface enhances the exterior of a house, and from the interior it gives perfect vision. There are no ugly "wavy" lines or distortion; no detracting from the beauty that comes in — through the window.

"Plate Glass and the Home" is the title of a brochure being widely distributed among the public. A copy will be sent you free and post free on request. Write

BUILDING WAGE GRADES

Grade Classification	A	A1	A2	A3	B	B1	B2	B3	C	C1
Standard Rates	1/8	1/7½	1/7	1/6½	1/6	1/5½	1/5	1/4½	1/4	1/3½
Labourers' Rates	1/3½	1/2½	1/2½	1/2	1/1½	1/1½	1/1	1/0½	1/0½	-/11½

The following are the gradings of towns in England and Wales. The rates quoted apply to all craftsmen, with the exception of those marked with an asterisk, which denotes that there is a differentiation in the rate paid to painters, details of which are given separately at foot. The London rates are:—Within a 12 mile radius from Charing Cross—all craftsmen (excluding painters), 1s. 9d.; painters, 1s. 8d.; labourers, 1s. 4d. From 12 to 15 mile radius, all craftsmen (excluding painters), 1s. 9d.; painters, 1s. 8d.; labourers, 1s. 4d.

THIS IS AN ABBRIDGED LIST; THE GRADINGS OF OTHER TOWNS MAY BE HAD ON APPLICATION TO THE EDITORIAL OFFICE OF THIS PAPER

THE ÆSTHETIC TREATMENT OF CONCRETE

The late nineteenth century protagonists of the Gothic revival were wont to extol the theory of thrust and counter-thrust in the mediæval Cathedral as evidence of the scientific truth in buildings of this particular style; and from this standpoint, some of the more daring were led on to express a limited enthusiasm for the work of the engineer, whose habit was to express scientific truth in stark and uncompromising terms. At that time, the engineer was concerned mainly with expression in steel, which in most buildings was discreetly covered up, or, if nakedly visible, generally took the form of pleasant lattice patterns that even the super-æsthetic could be persuaded to admire. One could always point to the lattice standards of the electric lamps in Nine Elms Goods Yard for delicacy in steel design, or to the massive members of the Forth Bridge as evidence of sheer beauty achieved by solving structural problems in the most economical and direct manner. But one had to select one's examples. It was difficult to raise any enthusiasm for the average gasholder, although it might be, and probably is, the most direct and economical solution of the gas engineer's storage problem. And practically no one had a word to say for Charing Cross Railway Bridge, despite its lattice members, though, being more on the lines of a post and lintel structure, its classic taint naturally put it out of court. Concrete was much used, of course, but was the Cinderella of the engineer's materials, relegated to foundations, retaining walls and such positions.

When the engineer, however, combined his steel and his concrete into a new composite material, the whole situation was changed. Structures in the new reinforced concrete began to rise all over the country, at first mainly confined to strictly utilitarian buildings, such as coal and grain hoppers, tanks, minor bridges, culverts. Later on, factories, warehouses, stores, grand stands, and important bridges came into concrete existence, and it became evident that there were few buildings that did not lend themselves to construction in this new material

the only defects of which, from an æsthetic point of view, were inherent, being bad colour, derived from the cement, and bad texture derived from the inevitable shuttering.

These two defects have held up the development of reinforced concrete for normal architectural work, but we have repeatedly urged that architects should endeavour to find a logical expression for the new material. One or two, notably Mr. Maxwell Ayrton, have made interesting experiments in colour and surface treatment by the use of coloured aggregates and by hammer-marking. The larger problem of design has scarcely been tackled yet in this country, at any rate on the enterprising lines of French architects, such as the brothers Perret. It will not, however, be for lack of encouragement to the younger men, for the Institution of Structural Engineers has announced the foundation of the Brenforce Travelling Scholarship with the object of encouraging "the æsthetic design and artistic development in England of concrete and reinforced concrete." This Scholarship, of £300, has been presented to the Institution by one of the big concrete engineering firms, and will be awarded every three years. The first award will be made this year, and the Institution has issued particulars for competitors, who are limited to its membership. The successful competitor will be required to travel on the Continent for forty-two days. It is probable that the Rules governing the Brenforce Scholarship preclude competition by any but members of the Institution of Structural Engineers, in which case there is no more to be said. We think, however, that in general it is more satisfactory for prizes and scholarships to be awarded in open competition, even if limitations are sometimes imposed in competitions for designs for particular buildings. But in essaying a standard of æsthetics for a new form of construction, one must have a catholic jury and a good deal of publicity. Ideals of beauty hardly carry weight, if they are confined to a few enthusiasts, or represent only the views of one particular organisation.

Notes and Comments

More Trouble about Bridges

The further raid upon the Road Fund, which the Chancellor of the Exchequer announced on Monday, is bound to raise the ire of the motoring organisations. Indeed, the Commercial Motor Users' Association had already voiced their objection at their recent dinner, at which the Minister of Transport was present. Their particular grievance, at this function, was, however, what Mr. Shrapnell-Smith described as the action of the railway companies in trying to "bottle up motor transport" by failing or refusing to rebuild or strengthen their weak bridges over railways and canals, motor traffic, consequently, being forced in many cases to make long detours. Colonel Ashley, in reply, admitted that some of the railway bridges were unsatisfactory, but refused to admit that his department were in any way indictable for neglect. He retorted with a long list of new bridge enterprises which his Ministry had under weigh, though whether they will progress as rapidly now that that Ministry is to be abolished is open to question. The motor organisations are sometimes a little unreasonable; it is, for instance, hardly possible to rebuild or widen all the bridges in the country within five years merely to meet the requirements of motor traffic. The supine attitude of the railways is easily explainable. They are already complaining of the unfair competition of motor transport, and, unless forced, are not likely to rebuild their weak bridges to make that competition more effective.

Leasehold Flats

Leasehold flats are an innovation so far as this country is concerned, and the few cases in which this principle has been adopted do not seem to have met with much success. If the *Manchester Guardian* is correct, the latest and most famous example of the leasehold flat system in London seems also likely to misfire, and for a curious reason. For these flats, such exalted figures have been demanded that it was obvious they were designed chiefly for millionaires, the supply of whom is much greater on the other side of the Atlantic than here. Indeed, this important block, constructed on American lines, was generally regarded as intended to provide a *pied à terre* on this side for the tired magnate from Wall Street. But the acquisition of a lease over here apparently invests the Fifth Avenue inhabitant with an English domicile, a matter which immediately makes the owner an object of interest to our Inland Revenue authorities, and, in default of exact data, they proceed to assess him for income tax on the basis of an income reckoned at ten times the rent of his domicile. When so many of our middle class are struggling to pay rents amounting to a third of their incomes, this seems quite a reasonable basis, but the American millionaire, thus faced with income tax on both sides of the Atlantic, is chary of taking up an assessable domicile on this side; hence the difficulty with this new leasehold flat building.

Registration

The Architects' Registration Bill passed its second reading in the Commons, last Friday, without a division, and, on the suggestion of the Home Secretary, was then referred to a Select Committee. This was, undoubtedly, the best course to take, for a perusal of Hansard shows that most Members had very hazy ideas about architecture, and their comments, in consequence, often verged on the ludicrous. Even the Home Secretary, in accepting the principle of registration, inferred that it might favour scientific

qualifications at the expense of the æsthetic, whereas the great difficulty at the present time is to ensure that candidates have received sufficient training in the æsthetic side of their work. Until the architectural schools came into existence, it was usual for the architectural student to "cram" sufficient scientific and historical data to enable him to pass a qualifying examination; and his training in the vital matter of design was limited to what he could pick up in an office or what a pre-occupied principal could impart mainly by perfunctory criticism of the pupils' efforts on the draughting board. At its worst, the present system favours the man, without any training or æsthetic qualifications whatever, essaying architectural design, relying on the numerous text-books for scientific data to carry him through. We note that Professor Prior's name was advanced in the debate to justify a plea that architects should not be required to give any proof of their ability such as registration would necessarily require. In his earlier days the distinguished Professor graduated at a university, and his degree is a visible proof of his general educational attainments. It is the more difficult to understand then why he objects to some test for architects signifying that, in the future, they have had some acquaintance with the rudiments of the art they follow.

The Aldwych Sites

Rumours have been plentiful as to the future disposition of the two sites in Aldwych, London, which the Bush House Company relinquished some time back, after the completion of their centre block which aligns with Kingsway. A well-known theatrical manager was said to have acquired them for the purpose of erecting four new theatres; and the Indian Government was also supposed to be in treaty for one of them for the London offices of that Dominion. The Press Association has recently confirmed the latter statement, and has announced that building operations will begin this summer. Sir Herbert Baker, A.R.A., is said to be settling with the High Commissioner for India the final details of the design for the new "India House" to be erected. It is satisfactory to learn that, in general appearance, the new building will not be dissimilar to Bush House, and any jarring break in architecture will be avoided. That evidence of good manners in architecture was, in the circumstances, to be anticipated. It is to be hoped, however, that the London County Council will be equally circumspect when the design for the other vacant area comes up for consideration.

A Record of Old London Remains

The Museum Committee of the City of London Corporation have recently started a scheme for obtaining an accurate record of any structural remains of early London as revealed in the course of modern building operations. For this purpose, they have enlisted the aid of the Society of Antiquaries and the R.I.B.A., and have made an appeal to all architects, who may be cognisant of the finding of any such relics, to assist in the work. Briefly, it is proposed to record on a large scale map of London, which has been prepared by Mr. Charles Goad, details and measurements of all authenticated discoveries as they occur, and before they are removed to make way for the new structures. To this will be added, in time, a large amount of similar information which has appeared in various archaeological journals, so that eventually this survey will provide a vast amount of information about earlier Londons and, particularly, Roman London.

THE PARK CENTRAL SCHOOL, BARKING: VIEW FROM THE WEST SHOWING BOYS' SIDE AND BOYS' ASSEMBLY HALL.
C. J. DAWSON, F.R.I.B.A., Architect.

THE PARK CENTRAL SCHOOL, BARKING

No branch, probably, of architectural work demands such a receptive mind as the design of schools, for the essential requirements of these buildings have been constantly changed or modified to accord with progressive experience in teaching work or as the result of long-continued medical research into the physical needs and welfare of growing children. It is not surprising, therefore, to read in the report of a recent Parliamentary debate that schools which, but a generation or so ago, were accounted excellent, are now entered on a "black list" of unsuitable buildings, to be replaced as opportunity and financial exigencies permit.

The designer of schools finds it incumbent to keep abreast of the trend of modern thought and research in educational matters; he needs, too, to be well acquainted with new improved materials and equipment suitable for his particular purpose, and he has to keep a watchful eye upon cost, for, apart from the more or less limited effective life of school buildings, the fact that the majority of new schools are erected at public expense calls for economical as well as sound construction. To fulfil all the practical and utilitarian requirements, and yet ensure some measure of aesthetic achievement, is no mean test of a designer's ability.

But, in these days, the more intensive study of child life, of the reaction of the child mind to education, and of the part that all education should play in the training of future citizens, has influenced changes not only in the basic principles of planning and equipment, but in the character of the schools themselves, new types being evolved for particular educational purposes. Of such is the Park Central School at Barking, Essex, here illustrated.

Though not strictly to be classed among the secondary schools, it is designed to be complementary to the Abbey Secondary School, also owned by the Barking Education Authority, and for a curriculum which has a definite vocational bias. In the words of the Minister of Education, who formally opened the building last month, it is intended "to provide a different type of selective education appropriate to those whose bent of mind is more practical and less academic than what is commonly associated with the grammar school."

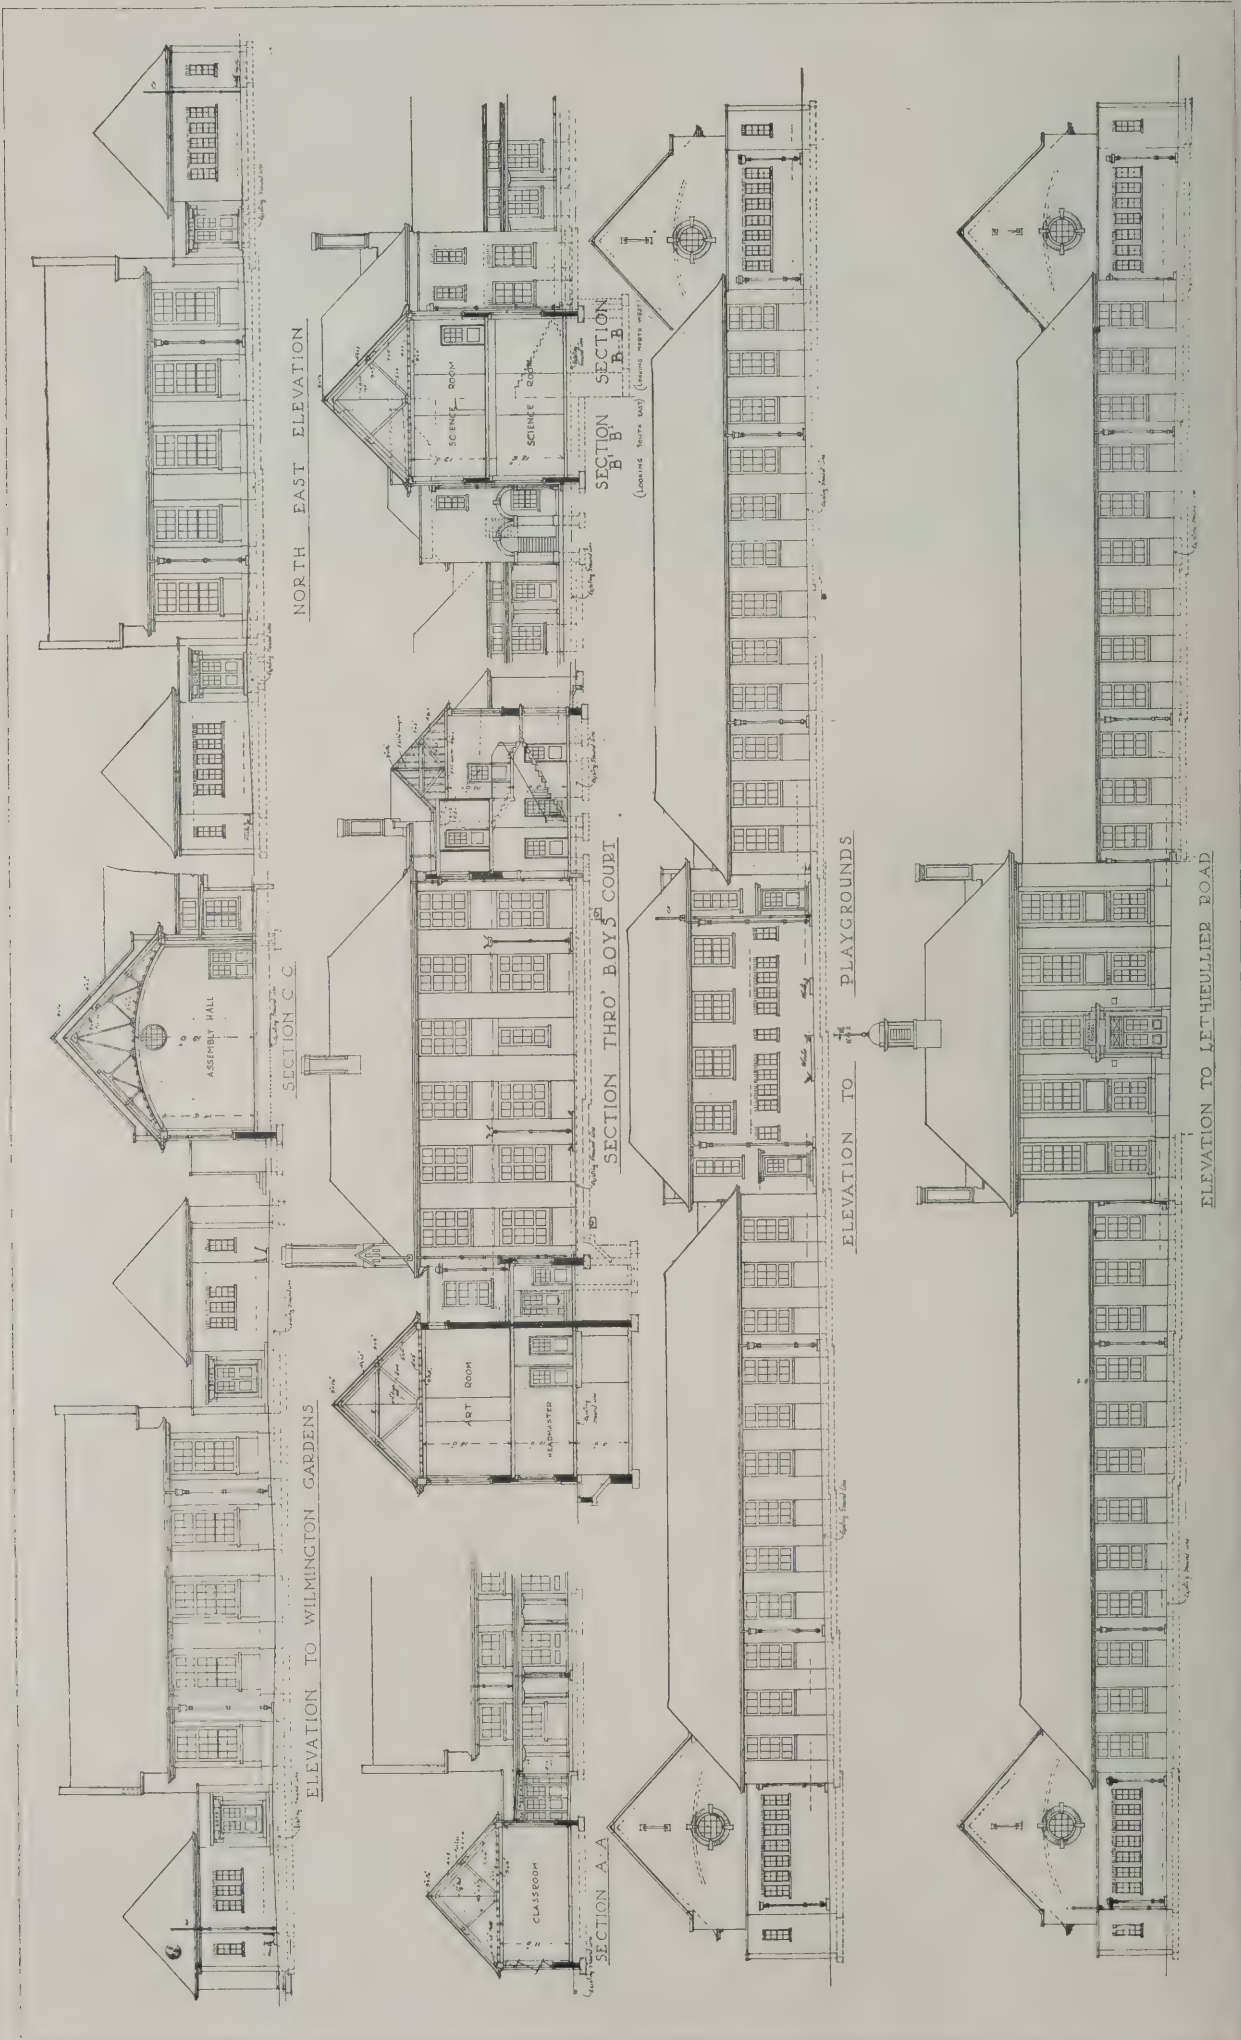

The architect of the new school, Mr. C. J. Dawson, F.R.I.B.A., has been fortunate in his site, amounting

to four acres, of which the buildings and paved playground have absorbed one-and-a-half acres, leaving two-and-a-half acres for a playing field; and the latter adjoins a new recreation ground of five acres which was laid out last year. This open and ample space has given the opportunity for a symmetrical and well-arranged plan, in which a two-storey block, containing the masters' and mistresses' private rooms and the special subject classrooms, forms a division between two open courts round which the single storey classrooms and assembly halls of the girls' and boys' departments are grouped respectively. There are two entrances for both boys and girls, opening directly to cloakrooms and lavatories, and leading to open verandahs giving access to the classrooms, which are lighted on two sides.

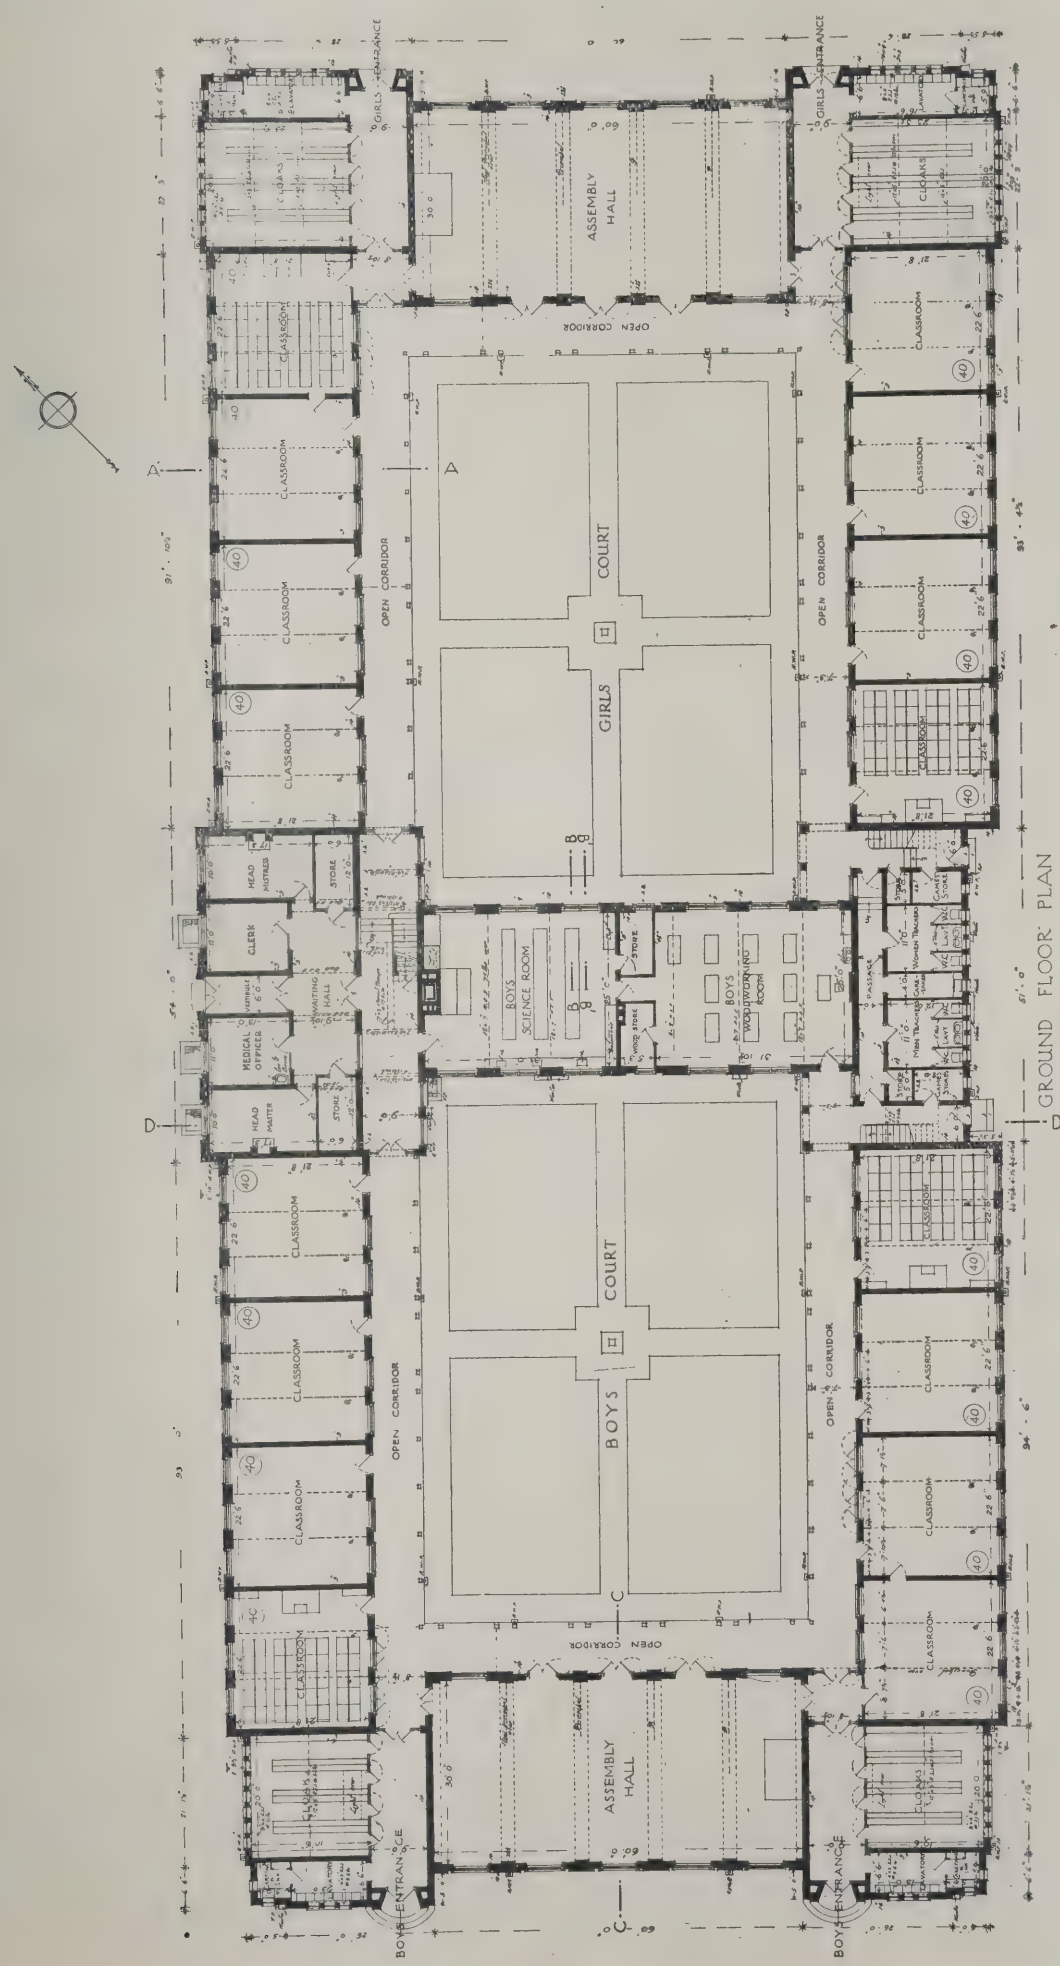

The main entrance from Lethiellier Road, in the centre block, leads to a hall, the private rooms of the head master, head mistress, medical officer and clerk, and a staircase to the upper floor. Below these rooms are the coal stores and heating chamber, and above them the art classroom, which is used by both departments. The centre of this dividing block has the boys' woodworking and science rooms on the ground floor, with the girls' science room and cooking and laundry room above. At the back of this block are other staircases and stores, masters' and mistresses' lavatories, and on the first floor are private rooms for the assistant teaching staff.

Accommodation is provided for 360 boys and 360 girls, and the general aim has been to obtain, as nearly as possible, the conditions of an open-air school, this being facilitated by the arrangement of open verandah corridors and the provision of large windows on either side of the classrooms, so fitted that practically all the window space can be thrown open for the free admission of air.

The buildings are of stock brick with tile roofs, and the elevations, as can be seen from the views, are straightforward and pleasantly proportioned, the centre divisional block forming a dominating feature which knits the whole composition well together. Lord Eustace Percy, at the conclusion of his opening speech, paid a tribute to the planning of the school, which, he added, for the benefit of any hardened economists who were present, was not only architecturally attractive but cheap.

THE ARCHITECTS (REGISTRATION) BILL

The House of Commons, after debating the Architects' (Registration) Bill for nearly five hours, decided, on the suggestion of the Home Secretary, who spoke on behalf of the Government, to refer it to a Select Committee. This means that the Royal Institute of British Architects will be able to appear before the Committee, by counsel if desired, and state their case for the Bill, and that the builders who are opposing it will be enabled to state their arguments against it. It will then rest with the Committee to recommend whether the Bill should be allowed to go further, with the amendments which are considered necessary. As there was an almost unanimous feeling in the House in favour of the principle of registration of architects, it seems probable that the Bill will be proceeded with, but its ultimate fate, when it has at length emerged from the Committee stage, must depend upon whether the Government are willing to give it the necessary facilities.

The debate was opened by Sir Clement Kinloch-Cooke, who moved the second reading. He stated the history of the movement for registration, and pointed out that, while a system of voluntary registration was all very well so far as it went, it failed for lack of statutory authority, and compulsory registration was needed. Great Britain, he said, is one of the few countries where architects are allowed to practice without statutory qualification. He was emphatic in stating that the promoters of the Bill have no desire to make the architects' profession a closed one, and care would be taken that the avenues of entrance for the talented sons of poor parents were kept open. The Bill proposed to do nothing more than to restrict the title "architect," and the use of the term "architectural" to people at present in the profession and to persons who in the future have obtained the requisite qualifications.

A well-reasoned speech was delivered by Lieut.-Colonel Moore, who seconded the motion for the second reading. He said that by admitting the necessity for the registration of barristers and other learned professions we had admitted that such a principle was not restricted to the professions concerned with the life and health of the community, but that it also applied to the professions which were charged with its well-being and culture. Why, therefore, should Parliament neglect to grant this concession to a profession on the efficiency of whose services depends the comfort and security of the population.

The first note of opposition was struck by Mr. A. V. Alexander, a Labour Member, and he moved the rejection of the Bill, but his objections to it did not prove to be formidable. He was specially concerned that the profession should not be closed to the working classes, and that there should be representatives of the working classes upon the advisory body. Colonel Wedgwood's objections were of a more sweeping character. He is himself a naval architect, but he opposed the Bill because he believed its effect would be to limit the number of entrants to the architectural profession and raise architects' fees. If it was desirable that no building should be erected without an architect being employed upon it, the restriction of the profession would lead to more and not fewer buildings being so erected.

On the other hand, the Bill was supported, on certain conditions, by Sir Alfred Hopkinson, who declared that nothing was more striking in the artistic and intellectual history of English life than the way in which architecture has progressed in recent years. He mentioned two examples in particular, the buildings of Bristol University and the Rylands Library in Manchester. He believed the Bill was a *bona fide*

who were interested in it, to improve architectural education. Then he came to what he described as "the other side of the picture," and protested strongly against Clause 11, which provides that if a man described himself as an architect without being registered he would be committing a crime. He objected to "this manufacture of various prohibitions which interfere with the ordinary liberty of people who wish to render some useful service and earn an honest livelihood." The prohibition should be limited to the use of the term "registered architect." A man with original ideas might not want to go through a course of study, and why should he be brought into a cast-iron mould? In matters of artistic taste, there should always be absolute freedom. Even Wren, greatest of English architects, might never have got on to the register, and if this Bill had been in force in his time, and he had not been on the register when he built St. Paul's Cathedral, he would have been liable to a fine of £50.

Criticism of the Bill came also from Major Hills. He reminded the House that architecture, as well as being a profession, is an art. To-day, he said, we have some of the finest architects that this country ever possessed. The Cloister at Winchester, the work of Sir Herbert Baker, is one of the most exquisite productions of the human imagination; and Sir Edward Lutyens and (in Scotland) Sir Robert Lorimer are great artists; but alongside of them there are many indifferent architects.

Somewhat unexpected support of the Bill came from a Labour Member, Mr. Gardner, who saw nothing inappropriate in a member of a party who are strong upholders of trade unionism being in favour of the architects having a statutory qualification. He was rather contemptuous of some of the references which had been made to Wren in the course of the debate. If the great designer of St. Paul's had been alive to-day he would not be a registered architect, because he was not trained as such; but the R.I.B.A. would assuredly have recognised him as an architect and elected him a Fellow. The promoters of the Bill, he continued, had agreed that a representative of the National Federation of Building Operatives should be on the board, this being the first occasion on which a professional body had agreed to give Labour such representation.

From the Conservative side, Sir George Berry contributed a reasoned defence of the Bill. After discussing its provisions in relation to the imaginative artist and to those who followed architecture solely as a means of earning a livelihood, he arrived at the conclusion that an education leading to registration can be relied upon to raise the average standard of our architecture and to counteract the worst types of incompetence without hampering the designer whose conceptions are noble, original and elevating.

After further discussion, in the course of which Captain Wallace, on behalf of the promoters of the Bill, intimated that certain concessions would be made to meet objections, the Home Secretary announced that the Council of the R.I.B.A., who had met him a few hours earlier, were willing that the Bill should be sent to a Select Committee for examination. He recommended, therefore, that it should be given a second reading, and after the measure has been fully considered by a Select Committee, it might be referred either to a Standing Committee or to a Committee of the whole House.

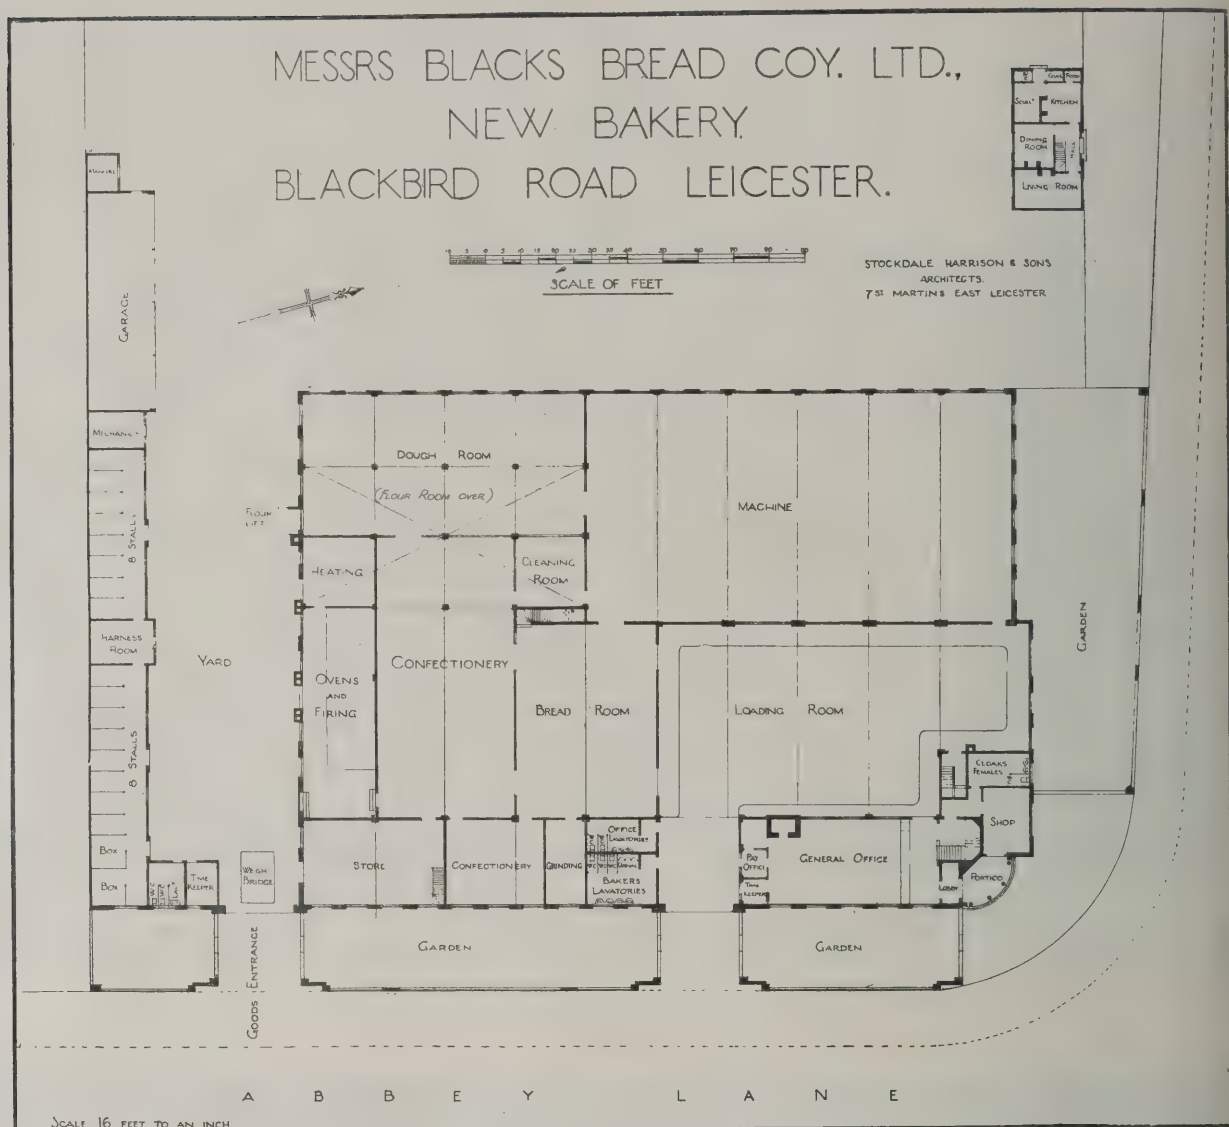

The motion for the rejection of the Bill was then withdrawn, and the second reading was agreed to without a division, as was also the motion to report the measure to a Select Committee.

NEW BAKERY, LEICESTER: GROUND FLOOR PLAN.

STOCKDALE HARRISON & SONS, Architects.

A MODERN BAKERY AT LEICESTER

The new bakery erected by Messrs. Black's Bread Company, to the designs of Messrs. S. Harrison & Sons, of Leicester, provides evidence that industrial buildings are tending more and more to be brought within the fold of architecture proper. This building is indeed the first bakery of its kind, and it suggests many interesting problems of design. A serious attempt has been made to give to the structure a marked individuality. Whether the building adequately expresses the idea of a bakery is a question easy to put but not so easy to answer, and it is perhaps doubtful if it is a fair question at all. Nowadays factories can seldom express their individual purpose for the simple reason that industrial operations of very many different kinds can be conducted in the same simple shaped big-windowed rectangular apartments. In fact, it is a new architectural phenomenon of our time that factory buildings of a stock pattern are often erected as a speculation, it being established that, provided the lighting and ventilation and the transit facilities are good, there will be little difficulty in letting the premises. In the case of a bakery, if the ovens happened to be of large dimensions and imposing shape and, moreover, could suitably be exposed, a certain architectural effect suggestive of a bakery might have been obtained. But such an arrangement was not feasible to-day because

it was necessary to make the building itself far larger than the ovens, and there was no obvious means of indicating the position of the latter on the elevations. An examination of the plan will reveal the fact that by far the greater part of the area is occupied by machine rooms, loading rooms, bread room and a room for confectionery, and the actual operation of baking does not take up more than a fraction of the space enclosed within the walls. The building owners, however, desired to make the bakery a dignified and imposing structure, and, seeking for an architectural feature which would give it an air of importance they hit upon the tower form, which in this instance is treated with skill and restraint. The clock is made an excuse for the tower, which otherwise might have seemed somewhat superfluous and perhaps also a little too reminiscent of ecclesiastical architecture.

It will be observed that the main part of the building is covered by roofs of the traditional "north light" section, which has never yet received a satisfactory factory architectural treatment. Perhaps the best way after all is to screen the elevation of these roofs by a tall parapet so that the arbitrary and discordant angles which the sloping roofs must necessarily make with the vertical do not obtrude themselves upon one's attention. This, however, is a rather costly process and has the disadvantage that it would obstruct some

NEW BAKERY, LEICESTER. STOCKDALE HARRISON & SONS, Architects.

of the light. In the present instance, however, this unsatisfactory feature is kept away from the elevations towards the street and thus will not give offence.

The principal architectural effort is made in connection with the general office building, of which the façade is given a highly original treatment. The wall is divided into five bays, separated by four vertical members resembling very broad fluted pilasters, which are, however, executed in moulded bricks. The horizontal band of wallage separating the two rows of windows is coloured white. This represents a welcome departure from the type of "vertical emphasis" which results in the grouping of several storeys into one formal entity in which the floor levels are almost entirely ignored. Here the two storeys receive adequate external expression, while at the same time their duality is mitigated by the powerful row of vertical members which unites them. It is a clever composition. The dark brick of the pilasters is repeated in the jambs of the entrance to the loading room, and the approach to the general office and shop is by a portico of elegant design.

The plan shows two main entrances for the works:

(1) For the yard, stables, garages, delivery of flour, coal, etc., the flour being hoisted by an automatic elevator to the store room immediately over the dough room. This entrance controls all the outside men and all goods coming in.

(2) The second entrance is for the bakers and office staff, and for the loading and discharge of the loaded vans.

The design of the plan was carefully considered in relation to the continuous progress of the work from the flour room—over the dough room—to the travelling ovens, coolers, wrapping machines, and discharge of the bread into the waiting vans in the loading yard. Also the close proximity of the draw-plate ovens with the dough room and the confectionery department, all surrounding the bread room, which is a store room for waiting goods to be despatched from the loading yard.

The office block commands the corner of the site, and contains the general office on the ground floor, with paying-in and interview rooms at one end, and a small shop in connection with the trade.

The private offices, board room, laboratory, kitchen and canteen are on the first floor.

Inspection of practically the whole of the works is arranged from both floors of the offices by the heads, as the divisions between the various departments are by glazed screens.

Coming Events

Edinburgh Architectural Association.—Saturday, April 16.—Visit to Borthwick Castle.

Hampshire Architectural Association.—Friday, April 22.—Annual General Meeting and Election.

The London Society.—Friday, April 22.—Professor A. E. Richardson, F.S.A., on "London Street Architecture." 18 John Street, Adelphi. 5 p.m. On Wednesday, April 20, two Visits will be paid to The British Museum. 10 a.m. and 4.15 p.m.

Architectural Association.—Monday, April 25.—Professor S. D. Adshead, F.R.I.B.A., on "Regional Planning." 34 Bedford Square, W.C.1. 7.30 p.m.

Royal Society of Arts.—Monday, April 25.—Mr. W. T. Walsh, M.A., on "The Measurement of Light." John Street, Adelphi, W.C.2. 8 p.m.

London Society.—Monday, April 25.—Visit to Dr. Barnardo's Homes. 3 p.m.

Royal Society of Arts.—Wednesday, April 27.—Mr. George E. Keay, F.C.I.E., on "Fire Waste (Loss of Property by Fire) and its Effects on the Economics

of National Life in Great Britain." John Street, Adelphi. 8 p.m.

Royal Institution of British Architects.—The Annual Exhibition of Modern British Architecture will be held in the R.I.B.A. Galleries from April 21 to June 3.

Town Planning Institute.—Friday, April 29.—Professor S. D. Adshead, M.A., F.R.I.B.A. (Past President), on "Replanning Bloomsbury." Caxton Street, Westminster, S.W.1. 6 p.m.

Building News in Parliament

The Government's Leasehold Bill

WESTMINSTER, Wednesday, April 13.

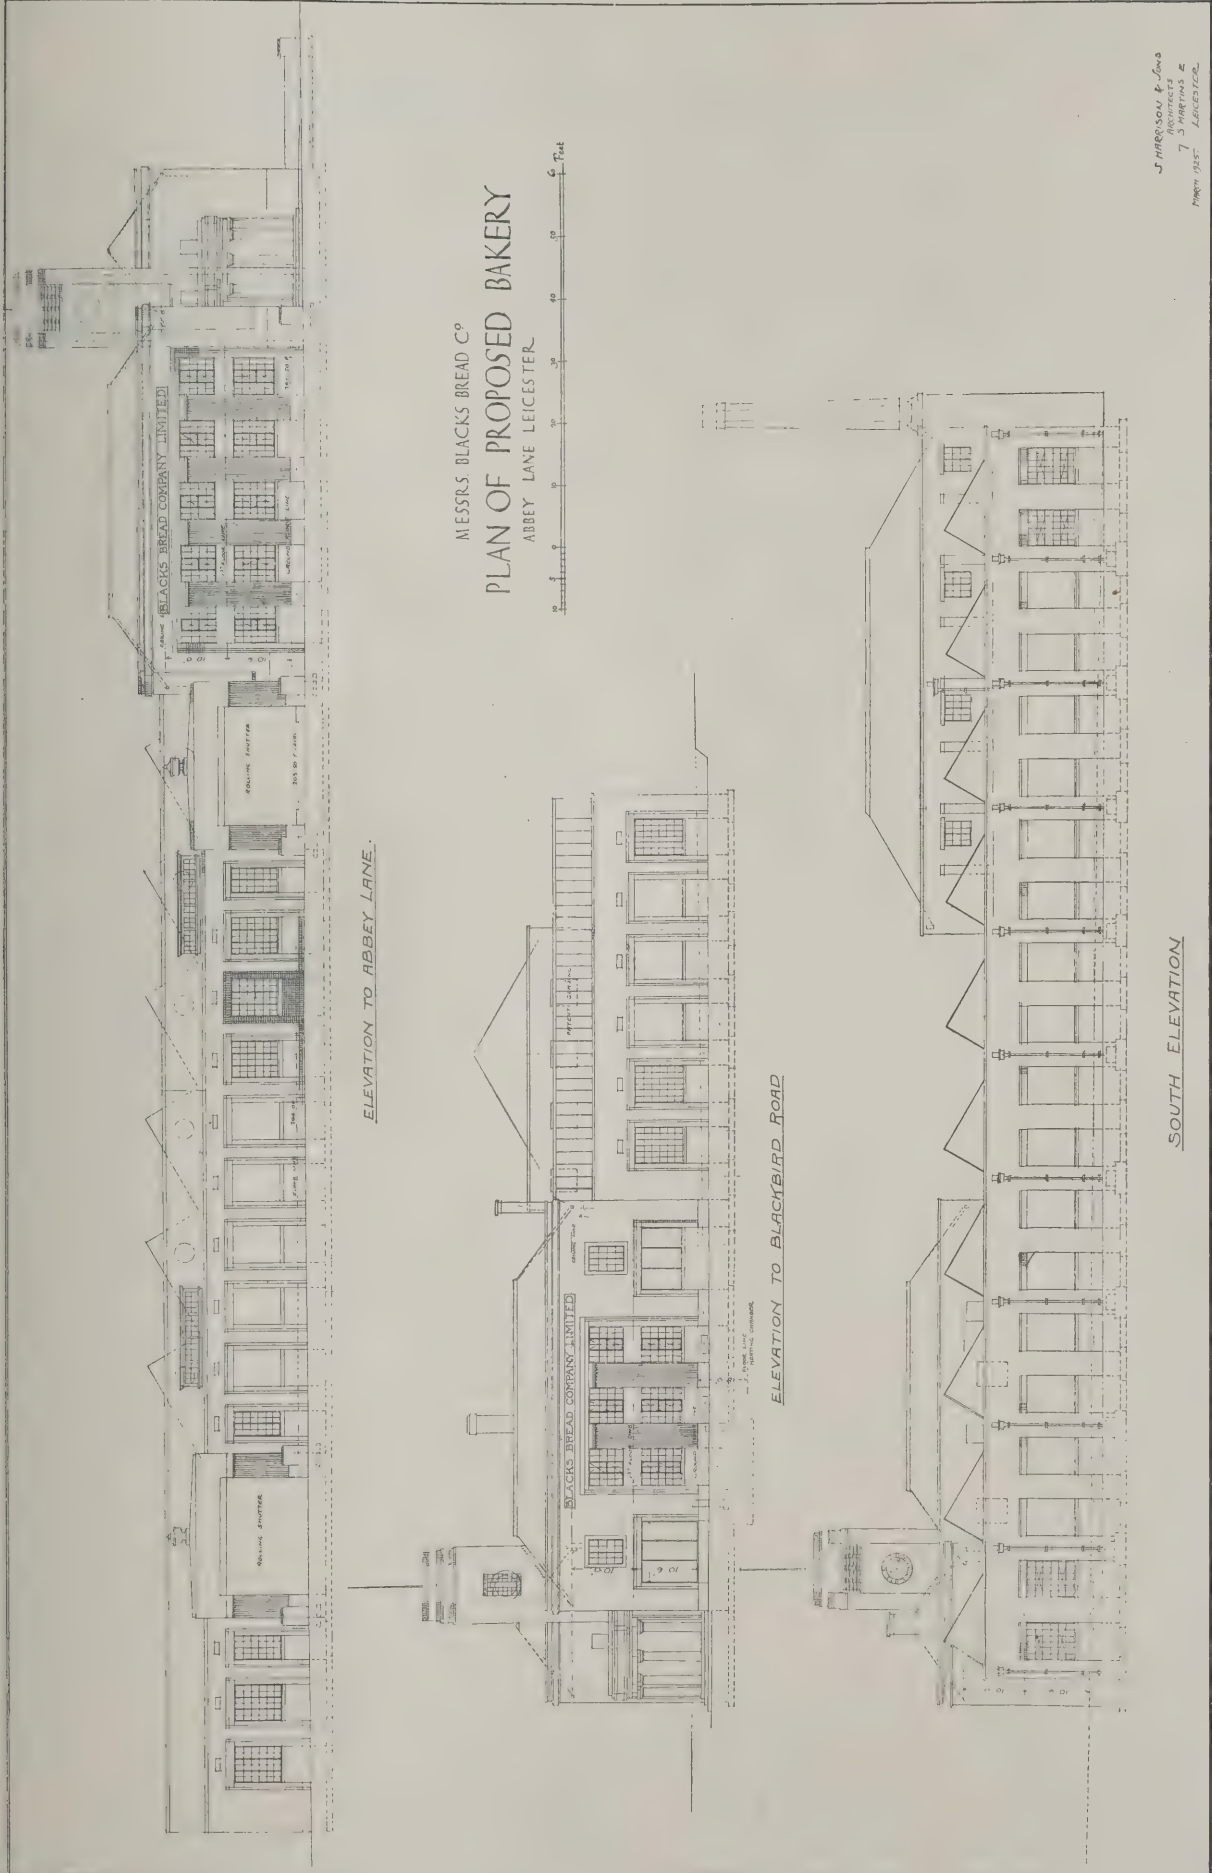

The Government's Bill dealing with leaseholds, officially known as the Landlord and Tenant (No. 2) Bill, has obtained a second reading, and, after Easter, it will be considered by a Standing Committee. Its provisions are confined to business premises, and are intended, as Sir William Joynson Hicks (Home Secretary) said in moving the second reading, to prevent landlords placing restrictions on the development and improvement of leasehold property, which the Government were of opinion should not be imposed in the 20th century. There are in many leases covenants forbidding structural alterations without the consent of the landlord and power to the landlord to take a fine from the lessee before improvements are permitted.

At present tenants have no right of appeal in such cases; but, under the Bill, they will have a right of appeal to an independent tribunal, who will be empowered to make such allowances to the tenants as are considered fair. The question of goodwill can also be the subject of appeal to the tribunal. The object of the Bill is to protect the tenant against the harsh and unconscionable landlord either in regard to goodwill or improvements or restrictive covenants. Where the tenant has effected certain improvements the capitalised value of these may be awarded to the tenant and the landlords will be required to pay it.

As the Bill now stands, it is proposed that the right to compensation for improvements shall be limited to those made after the passing of the Act. A tenant will not be able to obtain compensation for an improvement which is part of a bargain between him and the landlord, and in respect to which the tenant and the landlord will be required to pay it.

Another part of the Bill deals with compensation for goodwill. A tenant will be given the right to appear before the tribunal and apply either for renewal of his lease or compensation if he is deprived of it. Naturally, everything will depend, in the working of a measure of this kind, upon the character of the tribunal. The Government have adopted the plan of requesting the Lord Chief Justice, the Master of the Rolls, and the President of the Surveyors' Institution to establish a panel of 20, 30 or 40 independent men with experience of land and houses and business premises. If the parties prefer private arbitration to going before the tribunal, it will be open to them to have their cases dealt with accordingly.

The Home Secretary expressed his confidence in the effect of this Bill, when it passes into law—and they are willing to consider amendments which will improve it—will be to remove grievances which tenants have felt for a great many years. The measure was received favourably by the House, and criticism was largely disarmed by the Government promise to consider on Committee stage any proposals which are made to them. The principal point made by the Opposition was that the Bill ought to be extended to dwelling-houses.

Fig. 45.—ELEVATION TO ROAD. IN THIS CASE THE FACADE OF THE HOUSE HAS BEEN BROUGHT AS NEAR TO THE ROAD AS POSSIBLE, BUT THE PLAN IS SUCH THAT THIS PROXIMITY DOES NOT IMPAIR THE ATTRACTIVENESS OF THE PRINCIPAL ROOMS.

THE TWENTIETH CENTURY HOUSE

XII.—A Detached House. The Problem of the Garage

By A. TRYSTAN EDWARDS.

In the last article I gave some plans and elevations of a terrace type of house, especially designed to enable its occupants to live in quietude, even if the terrace were situated on a main traffic route. This problem of noise is one which appears to have caught the architectural profession unawares, for in spite of the fact that the enormous increase in motor traffic is not only making our urban streets unbearable, but is also spoiling the amenities of suburban and even semi-rural roads, very few new houses appear to be so planned that the principal living-rooms face away through the streets. It would, of course, be a regrettable necessity if modern houses, owing to the traffic nuisance, were obliged, somewhat discourteously, to turn their backs upon the streets, but there can be no doubt the time is coming when the street façade will present a certain aloofness, which was foreign to the gracious house frontages characteristic of the more leisurely eighteenth century. Of course, the entrance front will nearly always be situated in the façade facing the street, and if this be sufficiently elaborated, as in the terrace design illustrated in the last article, it cannot be said that the house is treating the public thoroughfare with disdain. In the case of this latter design it may be suggested that the street façade would have expressed more suavity had a certain number of blind windows been introduced, in order to give a symbolic recognition to the fact that the wide expanse of wallage between the entrance recesses belonged to habitable rooms and was not just a screen separating the road from the gardens. Perhaps, however, a visible roof line above the parapet would suffice to establish the existence of a building behind the wall. One of the problems of modern domestic architecture will be the expression of a certain polite aloofness in street façades. Of course, an obvious alternative is to set the houses well back from the road, but this is not always a satisfactory arrangement, for if the size of the plot is limited it reduces the area of the garden at the back of the house while interposing in front of it a dusty and noisy stretch of ground which is of little recreational value to the occu-

pants of the house. A wiser policy, and one which is in accordance with the dictates of economy, is to bring the houses as near to the road as possible, but so to plan them that this proximity does not impair the attractiveness of the principal rooms.

Figs. 45-49 illustrate a type of house which is designed with this very object of enabling it to be placed fairly near a main traffic route. It does not, however, exemplify this point alone, for it also is intended to meet several other requirements of the modern house. It will be observed that whereas the two terraces illustrated in previous articles were of houses suitable for occupation by people of moderate means, this is a large detached house, such as might belong to a family able to afford every convenience which money can supply. The advantage of planning such houses as this is that the standard expressed in them, the example of ample accommodation conveniently arranged, raises the general standard of house planning, inasmuch as it excites new ambitions in the mind of the average householder, who becomes dissatisfied with his own dwelling-place. Such dissatisfaction may appear blameworthy in the eyes of preachers of contentment, but nevertheless it is a great stimulus to architecture when everybody is taught to want a house better than the one he already possesses.

Let us examine some of the special features of this particular house illustrated (see Figs. 48 and 49). In the first instance it will be observed that none of the principal living-rooms, either downstairs or upstairs, face the road, with the exception of the kitchen and the maids' sitting-room. This is in itself a convenience, as it enables the maids to see who is approaching the front door and anticipate the ringing of the bell. The maids' quarters have been arranged as a separate part of the establishment, in which they can enjoy privacy. As is the modern practice, they have a sitting-room to themselves, and in the present plan this room serves the additional purpose of being an intermediate apartment between the hall and the kitchen, thus preventing the odours of cooking

Fig. 47.—END ELEVATION TO GARDEN, SHOWING GABLE END OF MAIN BUILDING IN CONJUNCTION WITH THE BLOCK CONTAINING THE GARAGE AND CHILDREN'S QUARTERS.

Fig. 46.—THE MAIN GARDEN FRONT. THE PRINCIPAL PART OF THE FACADE IS ARRANGED IN A SYMMETRICAL FORMATION TO WHICH THE WING CONTAINING THE MAIDS' QUARTERS IS SUBSIDIARY.

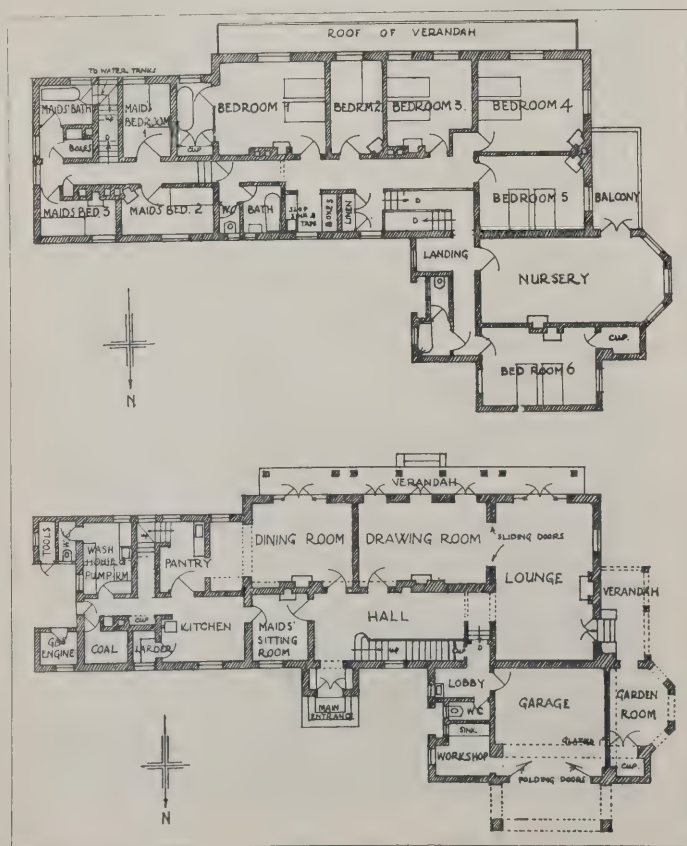

penetrating to the main part of the house. And the kitchen is similarly screened from the dining-room by the pantry. A small back stairs enables the maids to ascend to their bedroom flat with separate bathroom. On the ground floor the hall gives access to the dining-room, drawing-room and lounge, all three of which have French windows opening on to a verandah facing the garden. The dining-room communicates with the kitchen through the pantry, while the drawing-room and lounge can be thrown into one by the operation of sliding doors. From the lounge there is also access to another verandah leading to a garden room.

An important feature in the plan is the relation of the garage to the house. In very many houses built to-day the garage is a separate structure, and people cannot enter it from the house without first going into the open air and possibly in the rain. This is a great inconvenience. One should be able to enter the hall directly from the garage, through a lobby providing lavatory accommodation and room for cloaks. Such an arrangement has so much to commend it that it is surprising it has not been universally adopted in houses built in the present era of motor-cars. Of course, a certain economy may be expected if the garage is placed in a tin shed, but this is not architecture, and the time is now ripe for the garage to take its place as an integral part of the house with proper communication with it. It will be observed that a small workshop and sink have been provided in connection with the garage.

Upstairs, besides the three bedrooms for the maids, there are six other bedrooms, the principal one having a sunk bath. In this particular family it is assumed that there

are several young children, and care has been taken to provide them with quarters somewhat isolated from the rest of the house, so that they may be free to make as much noise as they like without disturbing anybody else. Over the garage is a separate wing containing a large nursery, with two bedrooms and a balcony leading out of it, while the landing gives access to separate bathroom and lavatory accommodation. An advantage of this particular arrangement is that it is suitable to several different kinds of family grouping. For instance, it not infrequently occurs that one or two families or sub-units of a family combine to dwell in the same house. Perhaps a father-in-law or mother-in-law might live in the same house as one of his or her sons or daughters, and yet be provided with a separate suite of rooms, and thus might lead an independent or semi-independent existence.

The elevational treatment is a compromise between the formal and informal. Towards the road (see Fig. 45) the garage is made subordinate to the main entrance, which gain in importance through the portico being the centre of a group of five windows, of which the three uppermost are placed in arched reveals and surmounted by a taller parapet. On the main garden front (see Fig. 46) the principal part of the façade is arranged in a symmetrical formation, to which the wing containing the maids' quarters is subsidiary to this. The end elevation (see Fig. 47), also towards the garden, shows the gable end of the main building in conjunction with the block containing the garage and children's quarters. Lastly, the elevation towards the yard (not here illustrated) is symmetrical, the central feature being the water-tower which encloses a chimney with five flues.

THE PAN-AMERICAN BUILDING, WASHINGTON: THE ENTRANCE FRONT, IN WHITE GEORGIA MARBLE.
ALBERT KELSEY and PAUL CRET, Architects.

A HOME FOR THE SOUTH AMERICAN REPUBLICS

The Pan-American Building, Washington, D.C.

Although nearly twenty years have passed since it was completed, the Pan-American building in Washington has had very little to fear from comparison with later contributions to the monumental architecture of the capital, in spite of the fact that there is no city in the United States which has been better served in the quality of its public buildings.

A happy combination of architectural talent is one explanation of the success of the Pan-American building. Another is the interest of the programme itself, and the beauty of the setting in which the building was to be erected.

The architects were Howard Kelsey and Paul Cret: Kelsey, an American—a travelling scholar of the University of Pennsylvania—Cret, a Frenchman, trained in the Beaux-Arts, and at present teaching at Pennsylvania. Both of these men combined qualities of imagination with a trained technique, and it was a competition assessed by a jury, which included Hornbostel and McKim, which gave them their great opportunity.

The site chosen was a happy one, in a park-like section of Washington in which fine buildings are placed in easy surroundings of lawn and planting; the Pan-American building is on a corner, and there are only two buildings in

close proximity, both of them being of moderate size and finished, like the Pan-American building, in marble.

The programme of the competition must have seemed a very interesting one to the seventy-eight competitors, for not only was it free from irritating restrictions, but both the nature of the accommodation and the requirements of expression gave the fullest scope to imagination and invention.

The object of erecting this building was to provide in Washington a home for the Pan-American Union, an organisation maintained voluntarily by the twenty-one American republics for the purpose of developing commercial friendly intercourse, and good understanding among all the American republics.

In the pursuit of these ideals the Union has, of course, to maintain a considerable organisation, for it naturally becomes a centre of information and of interchange of ideas and for this reason the expression of a dignified home for the Union had to be combined with that of what amounts to a combination of office building and conference hall.

Taking the accommodation in detail, the main requirements divided themselves into four sections consisting of the adminis-

tration offices, waiting rooms, archives, etc.; the library section, with reading room, stack room, periodical and map rooms, etc.; the assembly section, with the large assembly hall of 6,000 super feet for meetings, the board room, committee rooms, etc.; and lastly, the service section, which included all the plants, storage, caretaker's quarters, and equipment generally. And in addition, a most vital element of the programme, was the suggestion made to competitors that in the design should be incorporated a scheme for a "patio," recalling the courtyard which is such a feature of Latin-American architecture, both monumental and domestic.

The introduction of the patio must have caused great worry to competitors in deciding on a solution, for its situation on the plan was almost bound to be a central one, and in such a position it blocks the main axis and complicates the question of approach to all the other main apartments, since an open courtyard is scarcely practicable as a main avenue of circulation through the centre of the building.

The success of Kelsey and Cret in arriving at a satisfactory compromise between the conflicting elements of the plan secured them the premier award. They managed, by the arrangement which they adopted, to place the assembly hall as the climax of the scheme, to maintain the patio as an important element, and yet to utilise it as an adjunct to the assembly hall approach by linking it up with the monumental staircases, which provide the really outstanding feature of the plan conception.

The staircase in a building of this sort is always a most trying problem; if it is centrally placed it blocks the main axial vista, and if relegated to the two sides it very largely loses its monumental significance.

The solution adopted in the Pan-American building is a very clever compromise. Having decided that the assembly hall was the focal point of the design, the largest and most important single element, its placing in a fine situation overlooking the garden on the first floor became a fairly obvious desideratum. The library and its services demanded the nearest equivalent area of accom-

THE PAN-AMERICAN BUILDING, WASHINGTON:
DETAIL OF THE EXTERNAL STEPS LEADING TO THE
"HALL OF AMERICAS" ON THE FIRST FLOOR.

modation, and this fact, coupled with the desirability of a quiet location, determined the architects to place it beneath the assembly hall. Once this arrangement decided upon, the various other elements of the plan fell into a naturally ordered arrangement, the only remaining outstanding difficulty being that of the main staircase.

Studies for the final plan show the staircase in all the positions which would occur to a well-trained designer, the chief rival to the final solution being the favourite French arrangement of placing the staircase opposite the entrance on the far side of the vestibule, and rising to right and left from a common approach. This certainly leaves a central bay open to the patio, but it is far from providing the charming open vista which the present planning allows, and there is also insufficient width in the building to provide a really monumental "going" for a broad staircase.

The solution adopted has one grave disadvantage, namely, that the division of the approach to the assembly hall is unsatisfactory from the ceremonial point of view, the fact being that there are two staircases where one broad flight would have been more spectacular, but the provision of a great foyer as a vestibule to the hall brings the approach back to unity as far as any such arrangement can.

One of the most important changes made to the competition drawings during the study for execution was the virtual inclusion in the patio of the two staircases, a suggestion made by Mr. Benard, architect of the Legislative Palace for the City of Mexico. In the competition scheme the patio was cut off from the stairs by a light screen, as indicated on the plan; but as built the wide open bays shown in our illustration of the patio allow the ramp of the staircase and the vista of its ceiling to be clearly seen, resulting in an impression of increased spaciousness. This clever idea has in fact added nearly 40 feet to the apparent width of the patio.

THE PAN-AMERICAN BUILDING, WASHINGTON:
A GARDEN DETAIL.

THE PAN-AMERICAN BUILDING, WASHINGTON:
DETAIL OF THE GREAT BRONZE LAMP ON THE
ENTRANCE FRONT.
ALBERT KELSEY and PAUL CRET, Architects.

This arrangement of an open staircase would not have been possible if the patio had been an open courtyard in summer and winter, for even in Washington there are a few months of wintry weather, and the patio effect with its southern luxuriance of planting is only truly possible in the summer. Kelsey and Cret managed to overcome this difficulty by a system since adopted in several American cinema buildings, that of providing a sliding glass roof, electrically controlled, and divided into two halves which slide laterally and are invisible from the patio when not in use.

Apart from the conception of the plan, the most characteristic point in the design of the Pan-American building is the interesting variety of influences which are blended into it, for apart from the great assembly hall, which is treated in a free French version of classic, nearly all the detail is tinged with a flavour of Spanish, Portuguese or Mexican. The architects have not merely taken classic elements and covered them with exotic decoration; they have imparted this special Latin character in the broad and open proportions of the structure and maintained it in the use of colour and the wonderful ceramics, such as those which, in the patio pavement, show Mayan and Incan inspiration.

Of purely South American origin is the elaborate tile work of the garden loggia which stands at the end of the site facing the rear of the main building and which is incorporated in what is called the Pan-American annexe. This charming little building is very simple in its white plaster finish, but the loggia itself is a blaze of amazingly rich colours—blues, greens, blue-greens, tans and reds—the details being mostly taken from studies, made by Mr. Dulles Allen

LOGGIA IN THE ANNEXE TO THE PAN-AMERICAN BUILDING.

ALBERT KELSEY and PAUL CRET, Architects. J. H. DULLES ALLEN Co-operating.

The colour scheme of the lower portion is blue and green, and the frieze of Aztec figures is of tan colour. The remainder of the tile work is a deep rich red.

based on Incan decorative *motifs* and South American sculpture generally.

The garden of the Pan-American building is not the least attractive feature of the whole scheme. It is not large, 400 feet by 500 feet, and the building alone occupies an area of 160 feet by 160 feet; but the detail of its garden architecture is a model of appropriateness and restraint, for there must have been a strong temptation to crowd a great deal too much interest into this comparatively limited space. One of our illustrations shows a section of the lay-out in front of the annexe loggia known as "the blue Aztec garden." It contains a pool lined with blue-green tiles, presided over by the figure of a South American Indian, and a balustrade with rectangular openings, which ultimately it is hoped to fill with panels of

translucent blue faience or other material which can be effectively illuminated at night.

There are, of course, many criticisms which might be made of the Pan-American building, of which perhaps the most serious and controversial is the query whether the grafting on to this dignified little essay in the Renaissance manner of so much foreign and exotic detail has not been a somewhat wasted effort. Whatever influences of Latin-America may be expressed in the carving and ornament, and the profusion of semi-tropical planting, there is always present beneath the surface dressing, the flavour of the academic design, the product of logic rather than of imaginative creation. But it is not too much to prophesy that it will be considered by later generations as one of the classics of its country and period.

HOUSE IN PARKWAY, WELWYN GARDEN CITY.
C. M. HENNELL, F.S.I., and C. H. JAMES, F.R.I.B.A., Associated Architects.

These houses belong to the same group as that illustrated in last week's issue, and the materials are similar. The end house of the group is set back to allow south sun to enter the living room of the adjoining house, and to open up the corner of the road. The louvre shutters on the south ends are painted white. The front doorway and window over have wood surrounds.

The trellis porch on the garden side has 2 in. by 2 in. posts and rafters of painted deal with an infilling of 1½ in. by ¾ in. untreated oak battens. The windows are all set back 4½ in. from the wall face in reveals, the brick-on-edge arches being bonded into concrete cast *in situ*.

TWO HOUSES IN PARKWAY, WELWYN GARDEN CITY.
C. M. HENNELL, F.S.I., and C. H. JAMES, F.R.I.B.A., Associated Architects.

THE STAGNANT TRADE

By A LAYMAN.

I have latterly been contemplating the possibility of building a house for myself, and have so been led to a particular interest in the builder and his ways as they appear in the erection of an ordinary dwelling house. I am naturally not concerned with the higher flights of masonry or of steel and concrete construction; but I really am concerned when I watch with a speculative eye the painful processes of the local builders, as with little bits of burnt clay and odd pieces of wood and various slimes and pastes they contrive the bungalows and villas and small country houses of hereabouts. As a result, I am led to express my conviction that, of all the essential trades of to-day, house building is the most hopelessly conservative of its ancient inefficiency. Inefficiency in its means; inefficiency in its ends.

A two-storey house is being built on the Brighton Road. I have noted the excavators with their little spades preparing for the foundations; and one morning, strolling past, I see a cartload of bricks arrive. I stand and watch their unloading. There is a labourer on the cart, another on the path, another a few feet away just inside the plot, and, presumably, if the dump is somewhere at the foot of the back garden—which would hardly surprise me—there is a chain of a dozen more. The man on the cart picks up a couple of bricks and tosses them lightly to the man on the path, who tosses them to the next man, and so along the chain, like a game of "catch-ball." Thus are steamers unloaded by coolies in the benighted tropics; but, then, coolies are paid something less an hour than British labourers. I admire the unflinching dexterity with which the bricks are juggled from hand to hand. I do not admire the intelligence of the employers who can devise no substitute for it. Surely it is not beyond the resources of modern inventiveness. I know that bricks cannot be dumped out like gravel; but would it not be possible, for instance, to fit the cart with an inner lining on small wheels like a trolley—or, if the weight be too great, with two or three smaller trolleys—in which the bricks could be loaded at the yard and which could be slung out or wheeled out at the building site, to remain there till the bricks were used up?

When I next pass that way, I see the beginnings of an archaic contraption of poles and "ledgers" and "putlogs." I stand fascinated to watch the bricklayer at work. I find it easy to shirk any discussion of the rumour that his output is arbitrarily limited by his union, for, as a dispassionate observer, it seems to me that any limitation is quite superfluous, having regard to the limitation already imposed by the complicated manœuvres which are apparently necessary before a nine-inch brick becomes part of a house. A labourer, treading delicately, brings his chief a little parcel of bricks in a hod and deposits them neatly on the scaffolding, what time the latter goes through certain quaint motions with bits of string and pins and plumb rules. Agag departs on the long trail back to the brick dump and the bricklayer stoops to pick up a brick. He looks at it and feels it carefully, to reassure himself against the ever-recurring doubt that he is handling a perfect parallelopiped. Satisfied on that point, he fondles it a little, airily spins it once or twice, and gives it an affectionate tap with his trowel. I half expect him to snuff its bouquet or to crackle it in his ear like a cigar. Then he baptises it, smears it with mortar and deposits it reverently in its destined place, standing for a moment then in admiration of his handiwork.

He checks his rising vanity by a test with his plumb rule and his little bit of string; and assured at last that his brick is well and truly laid, he gives it an admonitory slap with his trowel, as who would say "Be good, fair brick, and presently you shall have a little baby brother." So at length he tears himself away, and stoops for another brick, to recommence the long cycle. And again and again, several hundred times in the day. And his mates do the same. And they go on, day after day, nine inches at a time, and in the fullness of time the necessary thousand of bricks have been carried and picked up and patted and smeared and laid and checked and slapped—and lo, the walls of the house are built!

A wonderful process, beautifully reminiscent of the minute post-mortem activities of the little animals that build the coral reefs, with the same long accumulation of microscopic material resulting by the passage of time in a visible mass. A process, too hallowed by antiquity. Thus were built the first houses of men, when they left their caves and nomads tents and asked for something more permanent than wood and wattle. Thus was built the Tower of Babel, thus toiled the Israelites under the lash of the Egyptian task-master—using just the same little bricks, carried in the same hods, pasted with the same mortar, checked by the same pieces of string, with the same slow care and patient rule of thumb, persisting through the Dark Ages and the Elizabethan revival to culminate in the brickly wastes of London and the other great cities of the nineteenth century.

Stand awhile, say, on Southwark Bridge, and contemplate the piled masses of brickwork on every hand, let your imagination dwell on the millions of millions of nine-inch units of which it is composed, each individually laid in place by the ant-like toil of the sands of wasted lives; grasp, if you can, the overpowering total of the needless effort and time at a cost of which you see the ugly monument; do that and despair of the intelligence of humanity! Can human ingenuity not devise some quicker method of putting up a wall than the niggling collocation of little clay blocks? Is no other and better process feasible for the erection of a dwelling house? In the enlightened twentieth century, is no advance from the methods of our prehistoric ancestors possible in the building trade, alone among the necessary services man? There are obvious economic and sociological answers to these questions to which we may allude later; but considering them now from the simple point of view of mechanical practicability, the answer can only be "Yes" to all of them. Who that has faith in human progress can doubt it?

Let us discuss the great unit of house-building: the common brick. I believe it was standardised in its present size some three hundred years ago; and apparently three hundred years of custom has made its dimensions sacrosanct. But could they not be bettered? Speaking with the confidence of ignorance I should say they could. Supposing, as an extreme example, the standard brick were twice as long, wide and deep as it is at present. I know that its weight—about half a hundredweight, I suppose—would be prohibitive for ordinary handling by the bricklayer. But its weight might be greatly reduced by the use of frogs or some system of perforations, or some simple mechanical device could be substituted for mortar power, as it is in every progressive trade. If that could be done, it would mean that the equivalent of eight bricks would be laid with pretty much the same labour as is now necessary for one. In any case, is not some compromise possible? A brick of only two

the present cubic size would, even if solid, only weigh about fourteen pounds, and would—or should—save about half the labour.

Alternatively, I can imagine large bricks which would be no more than four-sided shells, moulded with suitable keys so that they might be bonded as headers and stretchers and laid without mortar, cement being then poured in the resulting continuous hollow. In other words, they would be connected together by cement internally instead of by mortar externally, and the resulting wall would practically be of cement—reinforced perhaps—with a thin brick facing.

Modification of the unit brick, however, while the most obvious, is not the only, nor probably the best, solution of the problem of simplifying house construction. Looking at the typical house elevation, it is essentially a matter of door and window openings with large blank interspaces of brickwork of varying shapes and sizes. Even more is this the case with the internal partition walls. Why could not these plain sections of featureless surface be separately moulded at the brickyards, or, alternatively, constructed at the builder's works, either as a whole or in pieces as large as is practicable? With suitable plant they could then be erected on the site in one operation, keys, ties or other devices being provided to ensure efficient bonding and stability. Needless to say, I do not propose that these blocks should be moulded solid or constructed of standard bricks, for that would be pointless, and their weight would be prohibitive; but I am imagining the use of some light, homogeneous material to form panels, which would not be called upon to carry the loads of the floors or roof. Such a system would be to some extent an approach to the method of building a half-timbered house; and that suggests that houses built by some modification of that old method could be considerably simpler and cheaper than the ordinary brick-built house. Why not, for instance, a light steel framework, with the panels filled by composition slabs such as are already in use for partitions, rough-cast perhaps on the outside, and plastered on the inside? Developing the idea further, is it not possible to extend to house building, in some simplified form, the principles of the steel and concrete construction used in big contracts?

I may be told that I am whipping a dead donkey, that these suggestions, where they are not crudely absurd, have already been anticipated. I know that experiments *have* been made here and there in steel houses and concrete houses and houses on various patent systems. But they remain experiments only, and presently are forgotten. Usually they are the experiments of engineers; and the "practical" builder, immobile in his ancestral rut, ignores them and clings stolidly to the good old Babylonian brick. He is abetted by the vast majority of architects—for whom, however, there is the excuse, or explanation, that efficiency in building methods is to them of less concern than the æsthetic result. It cannot be denied that the almost imperceptible variation of light and shade and colour of a good brick wall is far more pleasant to look upon than the dead sameness of a cement wall, even when new; still more, when one is mellowed, and the other patched and stained, by age. But that is an argument which does not apply to the very large proportion of bungalows and small houses—with which we are here only concerned—in which the brick walls are ultimately hidden by rough-cast, which I suppose could be as easily applied to a cement wall. In any case, it is an argument which could be met by a little ingenuity in devising methods of finishing surfaces other than brick in some way which would at least approach the same æsthetic conditions.

Much of the unwillingness of architects to abandon brick for small house building is to be explained by

the unredeemed ugliness of the various experiments which have been made in other mediums. This quite unnecessary ugliness has resulted largely from the fact that many of these experiments have been the work of engineers rather than of architects, and have been designed on utilitarian lines with a complete disregard of art, very much as the same engineers would design a cooling tower or a gasometer. But also it is accounted for by the fact that, even when an architect is found with the initiative to depart from old building traditions, almost invariably he seems to consider it necessary also to depart from all traditions of English house design; and in the fervour of his revolutionary zeal he handicaps an experiment in building materials by linking it with a quite unnecessary and usually disastrous experiment in architectural art. I have in mind a large country house built in concrete, photographs of which appeared some months ago in the architectural reviews: a pretentious slab-sided barn, a gaunt mausoleum, monument to dead taste. Such Teutonic monstrosities set in a lovely English countryside are insults to nature; and they are injuries to progress, serving—so needlessly—as awful object lessons to check in architects and builders any faint stirrings towards originality. But such horrid examples are really no proof that novel materials demand novelty in design; or even if they do, that novelty must inevitably take the uncouth forms of cubist fantasy. No more are they proof that our search for the simple and beautiful in house building must always bring us up against a brick wall!

When next I passed that way the carpenters had finished a complex wooden framework of rafters and purlins and what not, supporting a petty reticulation of battens on which the tiler was imitating the bricklayer's thousandfold repetition of a cycle of curious contrivances. Presently his insect industry would inch its way to the ridge, covering piecemeal the wide, unbroken surfaces of the roof clamouring to the intelligence, even more than did the walls, for wholesale treatment.

I conceive that the main purpose of a roof is to keep out the weather, and that the only essential strains it has to bear are those due to wind and snow, but in practice its own weight of heavy tiles, slates, or stone slabs seems to exceed any possible weather stress. If these could be replaced by sheets of thin weatherproof material, not only would the actual roofing be simplified, but the massive framework itself could, presumably, be replaced by a much lighter and more open construction, whether of wood or metal. One would hesitate, however, to champion the merits of a roof of corrugated iron or tarred felt; nor can one candidly claim that the crude red smoothness of artificial tiles is any improvement on the natural article, which at least will age to beauty. For the present, then, let us leave tiler and slater to their patient patchwork, until some genius bring us roofing material in sheets which will have the variegated charm of the old mediums, with a quarter of their weight.

The clumsy wooden framework of the floors strikes the eye of the inquiring layman as being almost as open to criticism as that of the roof. I believe the floors of dwelling-houses are built to carry a load of $1\frac{1}{2}$ cwt. per square foot. The first instinct of an engineer confronted with such a load would be to use a steel framework. There are no doubt practical objections to that, when the floor itself must be of wood; but then the engineer, still following his instinct, would at least attempt to remove the objections by devising some substitute for boarding.

(To be concluded)

London Building Notes

BARNET.—New casual wards and other buildings are to be erected at the Barnet Union Institution in West End Lane for the B.G. The contractors are Messrs. John Willmott & Son (Hornsey), Ltd., 40 Tottenham Lane, N.8, whose tender amounted to £7,930. Messrs. Trant Brown & Brightiff, A.R.I.B.A., 332 High Street, Kilburn, N.W.6, are the architects.

BURLINGTON GARDENS.—The Hotel Bristol in Cork Street, W.1, and No. 5 Burlington Gardens, W.1, are to be converted into a block of shops, showrooms and offices. The architect is Mr. H. Kempson Dyson, 25 Victoria Street, Westminster, S.W.1. The builders are Messrs. Griggs & Son, 100 Victoria Street, S.W.1.

CHEAPSIDE.—Foundations are being constructed for a block of offices and shops, to be erected on a site at the junction of Cheapside and Lawrence Lane, E.C.2. The builders are Messrs. G. E. Wallis & Sons, Ltd., 21 Pantons Street, W.1. The plans have been prepared by Messrs. Robert Angell & Curtis, 133 Regent Street, W.1.

FINCHLEY.—Work has started upon the first section of a block of buildings, which will eventually total 29 shops with flats over, upon a corner site in Finchley Road, N.W. Plans have been prepared by Messrs. D. Morris & Son, Ltd., 57 Charing Cross, S.W.1, and the building work will be carried out by Messrs. West & Brooks (Leyton), Ltd., 59 First Avenue, Leyton, E.17.

GOLDERS GREEN.—A picture theatre is to be built on a site in Golders Green Road, N.W. The architect is Mr. Clifford Aish, 22 Bedford Street, W.C.

HANOVER SQUARE.—A site at the corner of Hanover Square and Brook Street, W.1, is to be developed by the erection of a building consisting of shops, etc. The new premises have been designed by Mr. S. Gordon Jeeves, 14 Hanover Square, W.1. The builders are Messrs. Ford & Walton, Ltd., 254 High Road, N.W.6.

HOUNSDITCH.—New premises are to be built on a site at the corner of Houndsditch and Goring Street, E.1, for Messrs. Henry Marks & Co., Ltd., merchants. The architects are Messrs. Lewis Solomon and Son, 21 Hart Street, Bloomsbury, W.C. The builders are Messrs. F. & H. F. Higgs, Ltd., Station Works, Hinton Road, Herne Hill, S.E.

KILBURN.—New shops are to be erected in Kilburn High Street, N.W., to the plans of Messrs. T. P. Bennett & Son, F.R.I.B.A., 45 Bedford Row, W.C. The builders are Messrs. T. H. Adamson & Sons, 145 High Street, Putney, S.W.15.

LEIGHAM COURT ROAD.—It is proposed to lay out the Elmfield Estate, Streatham, S.E., for building purposes, and to erect a number of residences. The plans have been prepared

by Mr. Dudley P. Hayworth, 27 Clement's Lane, E.C.4.

MITCHAM.—Mr. Isaac Wilson, The Cedars, Common Side, Mitcham, has purchased a property facing Mitcham Common, and is making arrangements for the erection of a cottage hospital on the site.

NEW CAVENDISH STREET.—The block of property in New Cavendish Street, W.1, known as Nos. 8, 10 and 12, and also Nos. 29-51 Hallam Street, W.1, is to be pulled down to make way for a block of flats. The new block has been designed by Mr. W. S. Huxley, F.R.I.B.A., 100 Great Russell Street, W.C.1.

NORTHCOTE ROAD.—New premises are to be erected on the site of Nos. 35-37 Northcote Road, S.W., for the directors of the Westminster Bank, Ltd. Plans have been prepared by Mr. C. T. Lee, 9 West Side, Wandsworth Common, S.W., and the contract has been placed with Messrs. L. & W. Whitehead, Ltd., Portland Works, Portland Place North, Battersea, S.W.8.

PECKHAM.—A block of departmental stores in Rye Lane, Peckham, S.E., is to be erected as a local branch of the Co-operative Wholesale Society, Ltd. Mr. L. G. Elkins, F.R.I.B.A., 99 Leman Street, E.1, is the architect.

PICCADILLY CIRCUS.—A site in Denman Street and Sherwood Street, Piccadilly Circus, W.1, has been let on building lease by Messrs. William Grogan & Boyd, Hamilton Place, Piccadilly, W., for the purpose of the erection of a new theatre. The owner is Mr. Edward Laurillard, who has instructed Mr. Bertie Crewe, 75 Shaftesbury Avenue, W.1, and Mr. E. A. Stone, 20 Berkeley Street, W.1, to co-operate in the preparation of plans for the building, the cost of which is estimated at £120,000.

SLOUGH.—The directors of the Slough Estates, Ltd., propose to erect four additional factories. Work will be commenced within the next few weeks. The general manager of the company is Mr. E. H. Duley.

SOUTH KENSINGTON.—Work will shortly be put in hand in connection with the extension of the South Kensington Natural History Museum in Exhibition Road, S.W. The cost is estimated at £100,000, and the buildings will probably be erected under the supervision of H.M. Office of Works.

ST. MARYLEBONE.—The St. Marylebone Housing Society, Ltd., has acquired a site in Lisson Grove, W., which it is proposed to rebuild and make into self-contained flats. The first portion of the scheme, which will be carried out in sections, is to cost £12,000. One of the members of the advisory board is Mr. E. Guy Dawber, P.R.I.B.A., 18 Maddox Street, Hanover Square, W.1; the hon. secretary is Mr. F. Herbert Davies, 4a, Langford Place, N.W.8.

STRATFORD.—A cinema is to be erected in Tramways Avenue, Stratford, E., the cost of the building being estimated at approximately £100,000. The architect is Mr. George Coles, F.R.I.B.A., 40 Craven Street, Strand, W.C.2.

WESTMINSTER.—At a recent meeting of the Central Board of Finance of the Church of England it was reported that debentures had been issued to the value of over £163,000 for the provision of funds for the building of the proposed new White-lands Training College at Putney, and the Warrington Training College at Liverpool. Building operations are to be commenced on both sites at an early date. The architect for the White-lands College is Sir Giles Gilbert Scott, R.A., 7 Gray's Inn Square, W.C., whilst the architect for the Warrington College is Mr. A. H. Moberley, F.R.I.B.A., 46 Berners Street, W.1.

WESTMINSTER.—Work has commenced upon the erection of the Courtauld Institute of Bio-chemistry, in Cleveland Street, S.W.1, which forms part of the rebuilding scheme of Middlesex Hospital. The contractors are Messrs. Holland & Hannen & Cubitts, Ltd., 256 Gray's Inn Road, W.C. The architect is Mr. A. W. Hall, 17 Southampton Street, W.C.

WESTMINSTER.—The Metropolitan Asylums Board have decided to build new boiler houses, etc., at Caterham Mental Hospital, at a cost of £38,600. The building work will involve about £15,000. Plans have been prepared by Mr. W. T. Cooper, M.Inst.C.E., the engineer-in-chief, and quantities will be prepared by Mr. H. W. Biggs, 623 Ely Place, E.C.1.

Lead Paint Act

The Home Secretary desires to draw the attention of all master painters, master builders and others employing persons in painting buildings to the provision in the Lead Paint (Protection against Poisoning) Act 1926, which came into force on January 1, requiring every person who employs other persons in painting buildings—whether he uses lead paint in his work or not—to send to the Factory Inspector for the district in which his office is situated a written notice stating his name and the address of his office. This requirement was mentioned in announcements published in the Press in December last, but so far only a comparatively small proportion of the employers appear to have registered. Failure to register is punishable on summary conviction by a fine not exceeding three pounds. If the employer does not know and cannot readily obtain the Inspector's name and address, the notice may be sent under cover to H.M. Chief Inspector of Factories, Home Office, London, S.W.1.

The Hall Mark of Your Craftsmanship

IN setting up a high standard of Craftsman-like quality and efficiency for all our products we realise that such a standard creates an atmosphere of its own.

Those there be who have called us idealists, yet we have proved that untiring research and experiment can overcome most difficult problems and—

The practical results of our ideals in Craftsmanship hold a foremost place among the Electrical Accessories of to-day.

We have always maintained intrinsic merit wins. That explains the position held to-day by the products of

"Craftsmen in Electrical Switches."

MITCHAM.—April 23.—For additions to "Woodlands" Maternity Home, Devonshire Road, Mitcham. Messrs. Chart, Son & Reading, architects, Union Bank Chambers, Croydon. Deposit £1.

HY-RIB

The Combined Reinforcement and Centering

MESSRS. CHIESMANS' RE-BUILDING SCHEME, HIGH STREET, LEWISHAM.

Hy-Rib floors have been laid throughout.

Contractors: THOS. H. SAWYER & SON, LTD.

THE NEW BUILDING WILL CONTAIN 40,000 SQ. FT. OF HY-RIB.

HY-RIB FLOORS.

Hy-Rib is used in floors in conjunction with any type of beam, reinforced concrete, steel, or wood. Its use is very simple; the Hy-Rib is laid over or between the supports, with the lath side down, and the concrete is poured from above. The concrete flows through the lath surface sufficiently to afford a perfect key. Plaster is applied directly to the under surface as soon as the concrete is set.

Hy-Rib provides in itself the centering and reinforcement for the concrete, and thus greatly reduces the cost, simplifies the construction, and saves time in erection.

THE TRUSSED CONCRETE STEEL CO. LTD.

REINFORCED CONCRETE ENGINEERS

22 Cranley Gardens, South Kensington, S.W.7

RAINHAM.—May 4.—For the erection of a Telephone Exchange at Rainham for the Commissioners of H.M. Works. The Contracts Branch, H.M. Office of Works, King Charles Street, S.W.1. Deposit £1 1s.

PERSHORE (WORCS.).—Erection of houses in various parishes, for the R.D.C.: Messrs. Broads, Ltd., Malvern, for erection of 6 houses at Defford, £2,760; 6 houses at Birlingham, £2,748; 8 houses at Wyre Piddle, £3,490; 6 houses at Upton Snodsbury, £2,759; 6 houses at Hill and Moor, £2,748; and 8 houses at Crophorne, £3,719.

POPLAR.—For the enlargement of Woolmore Street School: W. Simms, 591 Commercial Road, Stepney, E.1, £3,318.

SHEFFIELD.—The Corporation have accepted the tender of Messrs. R. Charlesworth, Ltd., £2,704, for the erection of a pavilion in Graves Park.

SKIBBEREEN.—For the erection of a new district hospital at Skibberreen, the West Cork Board of Public Assistance has accepted the tender of Robert Kelly, Bantry, at £8,013.

STRETTFORD.—The E.C. have accepted the tender of Mr. Peter Hodgkinson, £8,616, for the erection of an elementary school at King's Road.

TANFIELD.—For the erection of 66 houses at Tanfield, for the Tanfield U.D.C., at £31,704. J. R. Heslop, P.A.S.I., architect. Mr. P. Heel, contractor, Stanley, Co. Durham.

WESTMINSTER.—The City Council Housing Committee recommend the tender of Messrs. Prestige & Co., Ltd., £30,670, for the erection of a block of working-class dwellings in Willow Street and Greencoat Place.

Brickmakers' Wages

Brickmakers are asking for an advance of wages. The joint committee of employers and workpeople has considered the application, and has failed to reach agreement. The executives of the unions will now review the position with a view to concerted action. The unions contend that wages in the industry are low, and that the industry is able to pay more. Their claim is for increases of 4s. per week for adult male time-workers, 3s. for males between 18 and 21 years of age, 2s. for youths under 18, 3s. for females over 18, and 2s. for girls under 18, pieceworkers to receive proportionate increases.

A New Paris Hotel

An important addition to the hotel accommodation of Paris has been made by the completion of the Hôtel Ambassador. It is situated in the new section of the Boulevard Haussmann, where it occupies the whole frontage of the northern side between the Rue Taitbout and the Rue Lafitte. In point of capacity it will be the second largest hotel in Paris. It contains 600 bedrooms, each of which is equipped with a bathroom and telephone. Among the special features devised to attract the American visitor is a quick-lunch restaurant.

EARLE'S CEMENT

The 16th
Feather from the Pelican
Plucked by WHEATH ROBINSON.

G & T. EARLE (1925) LTD.
WILMINGTON.
HULL.

CEMENT MANUFACTURE — 5. The cement is tested at all stages of manufacture, and final laboratory tests are carried out to ensure that the finished product more than meets the requirements of the British Standard Specification. This great care and close scrutiny means that "Pelican" brand cement is a product of uniformly high quality — a reputation which it has held for the past century.

Legal Notes

Architects' Claim for Fees

Mr. Justice McCardie and a special jury in the King's Bench Division recently began the hearing of an action by Mr. George Ernest Nield and Mr. Clifford Robert Davy, formerly carrying on business at Stone Buildings, Lincoln's Inn, London, as architects, against Mr. Hyam Joseph, solicitor, High Holborn, London. Plaintiffs claimed fees for work done as architects.

Mr. Mitchell Banks, K.C., and Mr. Blanco White were for plaintiffs, and Sir Henry Maddocks, K.C., and Mr. Pritt for defendants.

Mr. Banks stated that plaintiffs were Fellows of the Institute of British Architects. On March 10, 1925, defendant verbally engaged plaintiffs to act as architects and surveyors in connection with a proposed building scheme on the site of the Blue Coat School, near Snowhill Station, Birmingham. On April 7, 1925, defendant verbally confirmed and agreed with plaintiffs that he personally would pay their fees, and in July, 1925, agreed that the fees should be in accordance with the scale of the R.I.B.A. The scale applicable in a case like this in which the scheme was abandoned was 1½ per cent. on the estimated cost of the works. The estimated cost in this case was £170,000. Mr. Joseph explained that Sir David Davies, a solicitor in Birmingham, was interested in the scheme. The idea was to erect upon the site a large building to be used as offices, shops and chambers, and to promote a company to carry out the work. It was arranged that plaintiffs should go to Birmingham and inspect the site and see Sir David Davies. This was done in company with Mr. Joseph. At that time there had not been a discussion as to what fees were to be charged. The general instructions to plaintiffs were to get along with the scheme

and prepare plans. After the visit to Birmingham plaintiffs proceeded to get out preliminary plans. Discussions and correspondence followed. Plaintiff personally put in 358 hours on the work, their chief assistant put in 128 hours, and his assistant 20 hours. Plaintiffs were now asking as remuneration for the work a sum of £1,000.

Mr. Nield and Mr. Davy gave evidence in support of their claim.

On Wednesday, after a consultation between the parties, Sir Henry Maddocks, for the defendant, said that his lordship and the jury would not be troubled further with the case. Plaintiffs were good enough to appreciate that there might be some misunderstanding, and undoubtedly there was a misunderstanding so far as his (Sir Henry's) client was concerned.

Having heard the evidence of Mr. Nield, it was quite obvious on his evidence that it was a misunderstanding on the defendant's part that the plaintiffs' fees should be borne by the company when formed. In these circumstances terms had been agreed, and endorsed on counsels' briefs.

Mr. Blanco White, for the plaintiffs, said his client thought there might be a misunderstanding, and that it was essentially a matter for a compromise. The defendant had agreed to a compromise, which involved an order from his lordship if his lordship approved of the terms.

The Judge: Very good. I am glad to know that the parties have arrived at satisfactory terms.

Sir Henry Maddocks: It is very pleasant to see that there has not been the slightest allegation of bad faith on either side.

The Judge (to Sir Henry Maddocks): I think you cross-examined the plaintiffs in a way that showed you recognised their ability, their integrity and honesty.

Always smooth-running

Specify S.M.S.—the smooth-running lifts. So easy-running is an S.M.S. Lift, that its movement is only evidenced by the sight of floors and gates moving rapidly past the cage. There are no jolts or jars to cause mechanical and physical strain—just a free, easy movement which tells its own story of painstaking engineering.

Our lift booklet should be read by all interested in lift installations. It contains much useful data and a copy will be sent free on request.

Planked gangway with handrail complete	4/-
Proper gantry complete	40/-
Sleeper roadways	8/-
Needling, strutting or shoring, including all labours and use and waste in erection and removal	Per Foot Cube 5/-
DEMOLITION	
Pull down brickwork	Per Ft. Super reduced In small quantities In considerable quantities 6d. 2d.
Add, if in very small quantities not exceeding 21 ft.	3d.
Add for filling baskets with debris and running same out to carts	1 1/2d. 1 1/2d.
Add if debris has to be raised or lowered to ground level	2d. Usually dropped
Add for cartage when same costs 4/6 per 1 1/2 yard load	2 1/2d. 2 1/2d.
Clean and stack old bricks	20/- per thousand
Hack off old plaster	1/- per sq. yd.

EXCAVATOR, CONCRETOR AND DRAINS.

	5 ft. deep	5 ft. to 10 ft. deep	Add if in trench
Excavate in common soil, wheel, fill carts and cart away	9/6	11/-	9d.
Planking and strutting	4d. per foot super.		
Planking, strutting and shoring	1/-		
Portland cement and ballast	1 to 6	1. 2. 4.	Hoisting
Concrete in foundations	29/6	36/6	2/6
Add if in ground floors	2/-	2/10	2/6
Add if in beams or lintels	3/-	4/-	2/6
Tested stoneware drains jointed in cement or standard iron drains jointed in lead, per foot run	4 in. 1/11	6 in. 2/10	4 in. 3/- 6 in. 4/6
Extra only for bends, each	2/6	3/6	11/6 20/-
Ditto for junctions, each	3/-	4/3	19/- 35/-
Gullies, including concrete surround and iron grating, each	16/-	18/6	35/- 50/-

BRICKWORK (Exclusive of Pointing).

	Flettons	Stocks	Blues
Built in 1 to 2 lime mortar	620/-	830/-	1060/-
" " cement mortar	640/-	850/-	1080/-
Damp course			
Two courses of slates in cement	10d.		1/3
1-in. asphalt	9d.		1/-
Facings			
Allow for every 5s. additional cost of the facing bricks over the common brick basis	1d.	1d.	plus 10%
Pointing (exclusive of scaffolding)			Per Ft. Super
Weather joint in cement			2 1/2d.
Flat joint in cement (struck) and lime whitening			1 1/2d.

ARCHES.

Extra over common brickwork	Per Ft. Super 1/-
In half-brick rings of bricks of same class as common brickwork	1d.
Add if of superior bricks for every 7/6 per thousand additional cost	6/-
In rubbed and gauged arches with fine joints	Per Ft. Run
Keels, angles, copings and sills of superior bricks	1d. plus 10%
Allow for every 5s. per thousand additional cost of bricks over the common basis price	1 1/2
Double-tille creasing and cement fillets and pointing to 9-in. wall	

PAVING.

	1 in.	1 1/2 in.	2 in.	2 1/2 in.	3 in.
Cement and sand	3/-	3/5	3/10	4/8	4/8
Granolithic	4/2	4/9	5/3	6/4	6/4
Asphalt	7/-				
Tarmac					4/8

MASON.

	Per Foot Cube	Per Foot Cube
York stone and all labours and mortar in hoisting and fixing	12/6	14/6
Artificial stone	9/-	8/-
Portland stone and all labours of usual character		
Bath stone ditto		

SLATER AND TILER.

	Per Square	Per Square
Welsh slating laid to a 2 1/2-in. lap with two composition nails to each slate	80/-	72/-
Add for every 1/2-in. additional lap	2/3	3/-
Add for copper nails	2/3	3/-
Best selected green Westmorland slates laid to a 3-in. lap, with copper nails		
Asbestos slates laid to a 3-in. lap, with compo. nails		
Asbestos corrugated roofing with galv. screws and limpet washers		
Plain red roof tiling 4-in. gauge, each tile in every fourth course nailed with two galv. iron nails		
Add for vertical work		
Add for circular on face in elevation		
Add for circular on plan, according to radius		
Add for circular on face in elevation and also on plan according to radius		
Old Delabole slates fixed complete—		
Size	Medium Grey	Medium Green
24 x 12 in.	90/-	93/-
20 x 10 in.	95/-	100/-
16 x 10 in.	86/-	91/-
14 x 8 in.	80/-	86/-
Green Randems No. 2		115/-
Grey-Green Randems		98/6
Green Peggies 12 in. to 8 in. long		87/6

Cuttings—Eaves	Per Foot Run
Ridges and abutments	Equal 1 foot super
Ridge tiling	Equal 1 foot super
Fixing soakers	9d. per dozen

CARPENTER.

Flat boarded centering, per yard super			
Centering to beams, per yard super			
Centres to arches, per foot super			
Fir framed in carpenter's work per ft. cube	Plates 4/-	Floor 6/-	Roofs 5/10
At per square			
Deal plain-edged flooring	1 in. 31/-	1 in. 38/-	
Battening for slates	10/-	11/-	
Roofing felt lapped and laid	12/- to 20/-		
Gutter boards and bearers per foot super			

JOINER.

Per square	1 in. 31/-	1 in. 38/-	
Deal plain-edged flooring	10/-	11/-	
Deal tongued and grooved flooring	12/- to 20/-		
Deal matching	36/-	43/-	46/6
Sashes, per foot super			1 1/2 in.
Deal moulded sashes, divided in squares			1/10
Windows, per foot super	Very small	Small	Normal
Deal casement frames, 1-in. linings, 1 1/2-in. pulley styles, 2-in. sashes in squares, oak sill, double hung with pulleys, lines and weights	11/-	5/-	3/6
Doors, per foot super	2 in. Panel	4 in. Panel	4 in. Panel
Square frame both sides doors	2/-	2/3	2/5
Add for each side moulded	2 1/2d.	3 1/2d.	4d.
Add for each side bead butt	4d.	4d.	4 1/2d.
Doors of hardwood such as oak or mahogany, will cost three times as exclusive of polishing.			
Staircase			
1 1/2-in. Deal tread, 1-in. riser, fixed complete per foot super			
2-in. Deal strings, per foot super			
Housing steps to strings each

THE STRONGEST AGGREGATE

MORE durable than granite; as hard as steel; waterproof and practically dustless, Betonac Steel Concrete makes an ideal non-slip surface for factories, roads, subways, etc. It is so graded that any type of surface from dead smooth to rough can be produced. Send a card for prices, samples and Report of National Physical Laboratory Report.

BETONAC STEEL CONCRETE

FRANCOIS CEMENTATION COMPANY, LTD
Betonac Department, 5 Bentley Works, Doncaster.

Is it possible to produce better cement than "Kaye's" Portland Cement, we shall be the first to make it. Are you using "Kaye's," one of the oldest English Portland Cements?

KAYE'S PORTLAND CEMENT

Builders requiring an efficient binding material which costs less than Portland Cement, we recommend "Kaye's" BLUE LIAS LIME, produced from the beds of the Lower Lias formation. Write to:—

KAYE & CO., LTD., Southam Works, nr. Rugby
Stocks: BIRMINGHAM, MANCHESTER, NOTTINGHAM, COVENTRY, LEICESTER, STOKE-ON-TRENT.

H & C WROUGHT STEEL VENTILATORS

YEARS of experience in the manufacture of Ventilators made from Wrought Steel have resulted in many and important improvements being effected, chief of which is increased capacity for the free transmission of air. We have reduced the area of fretwork obstruction and thereby largely increased the size of openings in our Ventilator faces, with added strength.

The air capacity of H. & C. faces will be supplied on request, together with sizes of Ventilators stocked. Made of heavy gauge steel to ensure rigidity and durability. Of all Ironmongers and Builders' Merchants.

Wm. E. PECK & CO. of London Inc.,
31, Bartholomew Close, LONDON, E.C.1

BUILDING WAGE GRADES

Grade Classification	A	A1	A2	A3	B	B1	B2	B3	C	C1
Standard Rates	1/8	1/7½	1/7	1/6½	1/6	1/5½	1/5	1/4½	1/4	1/3½
Labourers' Rates	1/3½	1/2½	1/2½	1/2	1/1½	1/1½	1/1	1/0½	1/0½	-/11½

The following are the gradings of towns in England and Wales. The rates quoted apply to all craftsmen, with the exception of those marked with an asterisk, which denotes that there is a differentiation in the rate paid to painters, details of which are given separately at foot. The London rates are:—Within a 12 mile radius from Charing Cross—all craftsmen (excluding painters), 1s. 9d.; painters, 1s. 8d.; labourers, 1s. 4d. From 12 to 15 mile radius, all craftsmen (excluding painters), 1s. 9d.; painters, 1s. 8d.; labourers, 1s. 4d.

THE DISCRIMINATING CLIENT

The British sense of equity has long conceded the principle that he who pays the piper has the right to call the tune—but not the power to compel others to dance to it. And as dancing is a gregarious pastime, this is a real disability, for there can be but little satisfaction in selecting a melody if one is left to execute a *pas seul* to it before an unappreciative audience. Which persiflage leads to the more serious conclusion that in other arts besides music, a patron can only effectively exercise his theoretical right if he has the approval, or, at least, the tacit consent, of his fellow men. Like the unfortunate student of irregular verbs, it is not until we have learnt the rule that we are confounded by the numerous exceptions to it. The records do not enlighten us, for instance, on possible procedure if the piper has a soul above cacophony or is obdurate on the subject of syncopation.

There is, for example, the patron of the architectural piper. Mr. T. R. Kimball was moved to consider him at a recent Club meeting at Omaha. And to the Nebraskan professional men present he had a few trenchant things to say about that individual. As a preliminary, he thought "that localities and communities confess their intelligence, or lack of it, through the architectural message spoken by buildings and physical appearance." He averred that "in most American cities the methods in vogue, almost from the beginning, have resulted in distributing the designing of buildings and monuments and planning of cities in a way for ever to preclude the accrual of any credit for intelligence to those who did the distributing. Pretty much all through European history, the architectural record is one of a struggle between intelligence and the lack of it, with the hand of scandal touching many of the masters." Even Michaelangelo is suspect for depriving St. Peter's of either of the finer domes designed by San Gallo and Bramante.

If we follow Mr. Kimball aright, "pull," either social or political or both, is the chief factor affecting the distribution of architectural patronage to-day, "the result in nearly all cases being hopeless," and the fact that the United States does possess some

fine buildings would seem to be due to the fact that "pull" and ability are sometimes effectively conjoined. His chief concern was to circumvent the operation of "pull" and to light upon "some safer and saner way of selecting architects," assuming that there are intelligent patrons who desire guidance upon the subject. But he has no love for the competitive method, which we have come to rely upon largely in this country; and we are afraid that his suggestion of direct selection, after long investigation into past performance, would be found too tedious by the average client, even if he were competent to assess on respective merit, which would seldom be the case. The machinery of the competitive method may be as cumbersome as Mr. Kimball believes, but we think it is far less onerous and much more certain in result than the complicated procedure he puts forward.

Conditions here, however, differ in some respects from those in the States. One hears occasionally of "pull" in connection with some local governing authority; but the Mother of Parliaments has too little interest in the Mother of the Arts to raise a breath of suspicion in that quarter. Our chief difficulty is the insistence of the private payee to call his individual tune, of which the eternal discord in our streets is the inevitable outcome. For that evil, there seems no speedier cure than the slow processes of education in the duties of disinterested citizenship. Collectively, our citizens are less inclined to dogmatism, less trustful, perhaps, of their personal inclinations and possibly more apprehensive when the cost of the tune has to be defrayed from the public purse. Certainly, there is an increasing tendency on the part of public bodies to seek competent advice and to consider favourably the competitive method of selection.

Mr. Kimball, in dismissing the competitive method as "wholly undesirable," ignores its efficacy in the encouragement of youthful prowess. The baneful influence of "pull" on the other side of the Atlantic is, apparently, largely responsible for the discouragement of youth in the minor American cities and towns; so that the talented purveyor of "frozen music" is driven into the larger centres of

population to find a more appreciative environment, with the result that the smaller communities lose "all that is promising in the new crop of architects" and suffer degradation in their buildings and consequent injury to both local taste and pride.

Civic pride is hardly, as yet, a conspicuous virtue in this country, but it exists and is growing. The increasing adoption of town planning schemes, the promotion of civic societies, the call for protection of existing amenities, the outcry against slums, the demand for open spaces and recreation grounds, the inauguration of the C.P.R.E. with the Premier's blessing, the existence of the Architecture Club, the

London Society and similar bodies, may be but straws, but they serve to show which way the current of feeling is running, and that there is a growing desire to improve upon the unfortunate results of the early industrial era. The individual patron is somewhat of a stumbling block but, though still imbued with piper and tune theory, he is beginning to react to the educative influences around him. We have faith that he will develop into a discriminating client, even though hardened professional opinion inclines to the dictum of a celebrated Dickens character that "there aint no sich person."

Notes and Comments

Lambeth Bridge

An announcement at a recent L.C.C. meeting that the rebuilding of Lambeth Bridge was to be proceeded with, and that tenders had been invited, which, by this time, have been received, has raised once again a question whether the value of the new bridge from a traffic standpoint is commensurate with the cost. The old bridge has been closed to vehicular traffic for many years, without, apparently, making the absence of its facilities felt; but, apart from this fact, the lack of suitable direct approaches on either side of the river gives cause for reasonable doubt whether money spent on rebuilding the bridge could not be expended to better advantage in other directions. We have an object lesson in this respect in Southwark Bridge, where the absence of proper approaches has left it practically unused. Not to profit by the moral of Southwark Bridge argues a singular obtuseness on the part of the County authority. But when, as an excuse for this sudden activity, it is explained that the rebuilding scheme is not to be delayed on account of the report of the Royal Commission on Cross-River Traffic, a body appointed years after Lambeth Bridge was closed, the project assumes a farcical aspect.

Public Control of Buildings

From time to time one hears of powers obtained by public authorities to secure not only constructional and sanitary soundness, but also the æsthetic qualities, of buildings in their district. One applauds this wider recognition of the responsibilities of public authorities, and wishes that others would come into line. We should, perhaps, be more enthusiastic if we could be assured that the powers so obtained were duly exercised. But rumour reaches us that the arbitrators or tribunals which are to administer these matters have not as yet been appointed; and the assumption that the cause of better building is being actively advanced is not, therefore, well founded. The obvious deduction would be that all new buildings rising in Bath and Ruislip are so far beyond reproach that no occasion has arisen for a decision on their æsthetic merits, but we can hardly suppose that to be true.

"Wet Time"

Loss due to "wet time" in building operations has produced its own crop of trouble in the industry; and the problem still constitutes one of the chief hindrances to friendly understanding and co-operation between masters and men. It has also given Mr. A. C. Bossom an opportunity for criticising building methods in our uncertain climate and for contrasting our somewhat supine methods in face of the weather with those which obtain in the United States,

where, apparently, he is accustomed to carry on in conditions far worse than are usually experienced on this side. A 23-storey building in Buffalo was finished in less than 15 months by the simple expedient of protecting the incomplete structure from frost and snow by tarpaulins; and as the building was 260 feet long, this waterproof coating was no small affair. In rainy weather, the workmen were also provided with mackintoshes, long rubber boots and sou'wester hats, "and they went on laying bricks." Unfortunately our principal building line just now is housing, and the expense of weather protection for these comparatively small structures might prove greater than their total value, or, alternatively, might add so greatly to the cost that housing would become an even greater problem than we are finding it at present.

The Wen

A manifesto, issued by the Garden Cities and Town Planning Association, questions the ultimate utility of the bridge improvements proposed for London. "London," it is stated, "is still spreading in all directions as a solid unbroken urban mass. Its suburbs are added in continuous rings. Its central buildings are getting loftier and more crowded. Longer and longer daily journeys and increasing discomforts are forced upon its working population." All this is true enough, and it means an ever-increasing "waste of time and loss of leisure." The Association's remedy is decentralisation on the Garden City plan, and it calls for a new policy which, in effect, means limiting the further expansion of the Metropolis. Whether such a policy is a feasible proposition remains to be seen. For good or ill, London decided in the dim past on a policy of separate dwellings for individual families, or, in other words, lateral expansion. It has never really been able to achieve that ideal, for overcrowding is more or less rife in most districts; and it is now apparent that the individual dwelling is an unworkable system with immense and increasing populations. By all means set a limit to London proper; Mr. Topham Forrest detailed a possible scheme for this some time ago, and it appears to be the first and most necessary move. The redevelopment of the area so contained under proper zoning laws, and the substitution of well-built blocks of flats for the square miles of slum villas erected during the last century would be the next step and would go far to reduce the waste of time, leisure and money to which the Association refers. But unless a definite limit is set up, it is difficult to see how you could select sites for new garden cities that would not eventually come within the orbit of an ever-growing Metropolis, and we doubt whether any narrow strip of open land would save such new centres of population from ultimate absorption.

MESSRS. COURTAULDS' NEW PREMISES

Although the City of London has meritorious modern buildings, they are mostly lost amid the jungle of undistinguished commercial erections of the last fifty years, and to detect them amid this welter is rather like searching for the proverbial needle in the figurative bottle of hay. The newer City of London has, like the suburbs, been largely built up by the speculator who, assessing everyone's taste by his own, or being incapable of realising that any better standard exists, has endowed the City with more "teased and worried" street fronts than can be seen in a square mile of any other capital in the world. Indeed, a walk through the City streets induces a conviction that the speculator conceives architecture as merely superficial adornment to be stuck on to buildings of any size, character and purpose: the more ornament applied — quality and suitability being negligible considerations — the greater the architectural achievement. No other hypothesis will serve to explain the evident pas-

sion for covering every square foot of possible and needed plain surface with pattern of some kind; or for whittling away the emphasis of main structural members with the distractions of sunk panels, lozenges, cartouches, chases and superfluous mouldings, devised, one presumes, to lead up to the crowning glory of a useless dome or turret, which, insecurely to the eye, is usually perched on one corner.

The leaven of architectural merit, however, if somewhat hidden amid the bulk of structures produced on the speculative recipe, is, perhaps, all the more forcibly emphasised by its immediate surroundings when one does come across it in the City's comparatively narrow streets. The new building of Messrs. Courtaulds, Ltd., which has been erected on part of the old General Post Office site in St. Martin's-le-Grand, is a case in point. After passing the banalities of Newgate Street, one meets this new note in City architecture with something of a shock.

OSCAR FABER, O.B.E., D.Sc., Consulting Engineer.

The correct expression for a steel-structure building will, doubtless, provide discussion and opportunity for designers for several generations to come. Twenty years ago, the purist, despite the obvious risks from fire and erosion, was demanding that the steel should be patently exposed. By-laws over-ruled him, and probably gave rise to the belief, not controverted by the designers of American skyscrapers, that if compelled to encase your steel, you were justified in ignoring it. Only of recent years have there been tentative attempts to express on the façades of a building the fact that a framework of steel really upholds it.

This principle in architectural design has its critics and it cannot be said to have yet reached its final and most logical expression. On the analogy of the human skeleton, there are those who deny the necessity for this truthful expression; but whatever views may be held on the main question, the new movement has given us some interesting buildings, of which the Courtauld building is not the least notable example. The problem is no easy one. Stern truthfulness would present a rather formidable conglomeration of awkward oblongs and attenuated ribs, defiant of seemly composition. It is not surprising, therefore, that expression in such essays as we have seen has been conventionalised or made symbolical, the vertical members being over-asserted at the expense of the equally important, structurally speaking, horizontal ones.

Such is the convention adopted in the Courtauld building, as in one or two others before it, but Mr. Sullivan's essay is very direct in expression and gains, we think, aesthetically on that account.

Confronted with this new note of verticality in modern commercial architecture, more than one layman of our acquaintance has dubbed it "Egyptian"; doubtless the batter of Adelaide House fathered the idea. But while lay slogans on art matters must be

duly discounted, the façade of the Courtauld building is broadly reminiscent of the Egyptian reed motif, with the tying-in at the fifth floor, and the feather wave of the cornice above. Which, again, is an instance of how modern art in any branch, when seeking out some new motif for expression, so often stumbles upon some derivative from archaic form.

If the new note in the Courtauld building stops short at the façades, we must not complain. The business man wants little in a commercial building but light and floor space; the opportunities for individual or even artistic treatment in the interior are, consequently, limited. Moreover, the floor area in the majority of commercial structures must lend itself to easy sub-division for almost any commercial purpose, so that, apart from lifts and staircases, the interior arrangement is seldom drawn up by the original architect. In this respect, the Courtauld building is more blessed than most, because it represents a complete scheme of accommodation for one firm, comprising offices, showrooms and warehouse space, sample and despatching rooms, staff accommodation, and some special rooms for the board of directors. As will be seen from the illustrations, the interiors have been treated on conventional lines appropriate to the particular functions of the various apartments, the decoration, mainly confined to the ceilings and chimney-pieces, being conceived on simple 18th-century lines.

One's chief impression of the Courtauld building is that it is a fine upstanding structure, which arrests attention and compels admiration by its simplicity of treatment; for that desirable result Mr. L. Sylvester Sullivan, the architect, and his co-adjutors, Dr. Oscar Faber, the consulting engineer, and the contractors, Messrs. Holloway Bros. (London), Ltd., are to be credited. For our part we rejoice that another Triton has appeared among the City's swarm of architectural minnows.

SMALL LUNCHEON ROOM, FOURTH FLOOR

FLUES: THEIR VIRTUES AND FAULTS

By AN INVESTIGATOR.

The theory of flues depends on a particular application of the general laws of ventilation and draught, which concern themselves with the facility with which air can be moved, rarified, and condensed. With the air in a chimney or flue, the warmed air rises only because the cold air is heavier, and the actual draught depends on the difference between the density of the rarified or less dense column inside the chimney and that of an equal column of the external atmosphere. This can be expressed as the difference in height of the two columns of air reduced to the same standard of density, and the velocity of the current is found by calculating that of a heavy body let fall from a height equal to the difference in height of the two aerial columns; the amount of draught produced is thus seen to depend upon the degree of rarification that takes place, the height of the chimney, and the temperature of the outside air.

These factors are expressed in the well-known formulæ $V^2=2gh$, where g is the acceleration due to gravity (32 feet per second), which gives us $V=8\sqrt{h}$ feet per second; and $h=Ht \times .002$ (the amount of increase of volume for every 1° Fahr.), where H equals the height of the column of heated air above the level of the fresh-air intake, and ' t ' is the excess in degrees Fahr. of heated air over the external or incoming cold air. We should be justified in expecting working formulæ to obviate failures by their practical application. Indeed, if we deduce formulæ to explain what the old builders did entirely by instinct and traditional experience, we must be careful to apply them continually in our own practice. For a formula supplants the fruits of tradition, and instinct always deserts us as soon as we bring in science to solve our problems. Nowadays inefficient flues either result from our relying on an instinct for doing the right thing that we no longer possess, or from failure to apply formulæ correctly. A formula must refer to all possible cases, or it becomes worse than useless. Local conditions have always to be reckoned with, for no two cases are identical, and in a climate like ours the conditions may be continually changing for any given case. Unless we know *all* the conditions, formulæ cannot help us to obtain satisfactory results.

Failure of the upward current leads to the evil of a smoky chimney, or a reverse draught, the cause of which is often so obscure that "down-draught" sometimes seems to be the manifestation of an original sin in building that all our science has not succeeded in eradicating. Even if the flue itself is properly constructed, trouble may arise from the position of its discharge, which may be too low, too near other exits, or adversely influenced by adjacent wall or roof faces. Most of the devices for curing smoky chimneys are attempts to make amends for errors in the termination of a flue, by the use of which after-thoughts the architectural sky-line becomes an eyesore. From the incongruous shapes met with one would imagine that each different chimney-top required a different type of device to deal with its smoke, and too often the roof of a fine piece of architecture has to carry the confession of the ignorance of circumstances in the original design and planning of the flues and flue-stacks.

The specification clause to "turn" chimneys does little to convey the real skill required in flue construc-

tion, and leaves much to the initiative of the workman. Above the fireplace the work must be gathered over to conduct the smoke into the smaller section where the flue proper starts, and it is essential that the smoke-conducting capacity should not vary in different parts. Clear runs from fireplace to sky-hole must be avoided, but bends must be made in uniform gradients that will not only offer the least possible resistance to the up-draught, but will suffice to intercept down-draughts. It is generally held that in practice the up-draught is increased by a contraction of the flue towards its exit, but the reverse has more to recommend it on scientific grounds.

The pargetting or internal lining of a flue is an all-important particular, the one indeed on which the old builders would seem to have relied most for obtaining a good draught. There are instances of old flues that have lost their action simply through the perishing of the original pargetting. The old use of cow dung and lime for this purpose, though it still continues to be specified in text-books, has now been almost entirely given up by consent, and it may be questioned whether we ever sufficiently appreciated the virtues of the old practice. Its application required experienced hands, for the material had to be spread in a thin, even coat; when applied thick it shrinks and cracks, falls off, and causes obstructions, which may end in making the chimney "smoke." When properly used, the sweeping of the flues is expedited. The liability of cement-stucco to crack with heat makes one doubt whether the modern builder's rendering can be quite so satisfactory as the traditional pargetting.

In badly constructed flues the chief faults found are long ramps, shallow gradients, awkward bends, and short vertical branches, all of which features greatly retard the up-draught and tend to make the chimney "dead." Very often the design of the fireplace opening is at fault, its form providing large air spaces on each side which allow too big a volume of air to mix with the hot air from the grate, which reduces the velocity of the up-draught in its very first stages. The leakages that occur in many old flues, often quite unsuspected, are also a serious check to what would otherwise be a perfectly good draught, besides being a constant source of danger from fire.

Persistent shortcomings are always largely due to indifference. If the domestic chimney were designed as carefully as the tall factory chimney, where the products of combustion have to be effectively removed, a smoky house would become a thing of the obsolete past. This is, in fact, an aspect of housing that calls for special research, the results of which can be available for all. The house originated in the hearth, and the evolution of the chimney must always be the most interesting study in the history of domestic architecture. If our troubles appear light in comparison with what our forefathers had to put up with in those dim days before the smoke of the Hall began to be "strangely conveyed," to Leland's wonder, by actual flues in the walls instead of through louvres in the roof, we still tolerate nuisances that need abating, and this can only be done by continued research work. If this article suggests no practical means for preventing rather than curing faulty flues, it may be useful in showing where improvement is to be looked for, and it will not have been written in vain if it elicit from those who have succeeded in overcoming difficult conditions of draught, authoritative contributions to the study of the house chimney.

THE ÆSTHETIC CONTROL OF ARCHITECTURE

By A. TRYSTAN EDWARDS.

An extempore address to the Manchester Society of Architects upon the subject of the Æsthetic Control of Architecture is the occasion of my attempting to set down a few of the considerations which with advantage may be borne in mind by legislators and others committed to the task of safeguarding our architectural amenities.

THE DETERMINATION OF THE FUNCTION OF CONTROL MUST PRECEDE ITS ORGANISATION

Can there be an æsthetic control of architecture and, if so, by whom is the control to be administered? It is far more important to know in what manner this control is to be used when once it is acquired than to attempt at this stage to elaborate the organisation fitted to carry it out. Moreover, the public, before it agrees to hand over to any particular committees such very great influence over our architectural destinies will want to know very precisely how such committees will exercise their powers. In fact, the representatives of the public are inclined to say to the "æsthetic controllers," "You tell us what you want to do when you are in the saddle; and then, and then only, can we decide what powers, if any, we are ready to confer upon you." Thus it is quite useless for well-meaning reformers to suggest the framing of organisation to effect æsthetic control, when they are not yet clear in their own mind what standards of taste they wish to enforce.

THE DEMANDS FOR ÆSTHETIC CONTROL OVER ARCHITECTURE

The measure of support which has been given to the Society for the Preservation of Rural England is evidence that certain things are happening to the country-side which, in the opinion of many, ought to be prevented. The evil, which is most particularly an architectural one, has not been very exactly diagnosed. To some the single word "bungalow" has power to crystallise their resentment, and they imagine that the builders of bungalows are the chief offenders against the amenities of rural England. Other critics are more concerned with what is happening in the towns, and affirm that our streets are being ruined, that masterpieces of civic architecture are being ruthlessly demolished and the new buildings erected in their stead are for the most part lacking in the attractive qualities which marked the old. While in the ranks of architects themselves there are to-day many distinguished practitioners capable of designing buildings which would adorn our towns, the fact remains that three-quarters of the new structures erected are not the work of architects at all. As each new atrocity is committed, a certain number of people angrily exclaim, "Such offences ought not to be allowed; they ought to be stopped by law."

THE NATURE OF THE OFFENCES TO BE CONTROLLED

What kind of offences am I referring to, and what kind of law could be framed capable of preventing their occurrence? Here I must leave the comfortable intellectual domain of generalisation and enter the thorny path which commits me to the task of specifying particular types of architectural misdemeanour. I shall make specific reference, therefore, to some of the modern architectural tendencies which need to be checked if we are to preserve such beauty and dignity as our towns still possess. Even at the risk of appearing dogmatic, it is necessary to develop the argument by means of illustrations, because no matter what body may be appointed to exercise æsthetic control over buildings, there must come a time when its

members are called upon to give definite judgments about designs submitted to them, and it is by the character of these judgments that their own competence as critics will be appraised.

THE SCOPE OF CONTROL.

Until a certain confidence has been established in the impartiality of the members of such committees of control, it is premature to assign to them their precise organisation. No matter whether the tribunal consists of persons apparently so well qualified for their office as are the members of the Royal Commission of Fine Arts, or whether it be a flourishing civic society or a committee of an Urban or Rural District authority, consisting, perhaps, in some country place, of the mayor, the vicar and the art master of the village school, there is sure to be some body who will cavil at their decisions and ask whether their taste is necessarily better than his taste. The initial step, of course, is to determine the scope of control and to make it have reference to principles already enjoying a large measure of public approval. In the first place, it may reasonably be laid down that a committee of control need not bother themselves very much with the internal designs and planning, for their principal concern should be with the outsides of buildings, for this is a matter of public importance. Again, all questions of style, formal composition of buildings, and its type of decoration, and in fact all aspects of design which may be described as "technical" might very well be excluded from its province and be left to the professional critics. But the social aspect of architecture is everybody's concern, and everybody gifted with general intelligence is entitled to express his opinion about it. And as most of the worst offences committed in the world of architecture are primarily social offences, faults not of technique but of manners, we may with confidence affirm that a measure of control directed in the first instance to the elimination of unsocial architectural acts will not only be immediately beneficial but comparatively easy to exercise, for we are here making use of a standard of criticism which none will dispute.

THE ENFORCEMENT OF A SOCIAL STANDARD IN ARCHITECTURAL DESIGN

The social standard in architecture finds its expression in the observance of certain relationships between public and private buildings, and between buildings of one class and others of the same class which may happen to be in their vicinity. The concept of rank and the concept of sociability should between them have a governing influence over civic architecture, and it is only where these concepts are neglected that we have the chaos and vulgarity so characteristic of much modern building. And these same ideas should also regulate the development of the country-side. It is nothing but the extreme lack of sociability in the new houses and bungalows erected near our suburbs and villages which causes such displeasure to all those who value the amenities of the country-side.

In the great creative periods of architecture buildings were held to represent an addition to the beauty of landscape, and it is nothing but a modern corruption of taste which has caused so many people to affirm a contrary opinion. The average householder regards with the utmost horror the prospect of new buildings being erected near his own home. He is afraid the houses will not "behave themselves." It is this ideal of "good behaviour" in building which the æsthetic controllers will need to enforce.

BERTHELOT'S SHOE SHOP IN THE RUE DU FAUBOURG ST. HONORÉ. THE FRONT IS IN YELLOW MARBLE, WITH BLACK SURROUNDS, BASE, AND TYMPANA.

“THE MODERN SHOP FRONT DE LUXE”

Some Recent Examples from Paris

By HOWARD ROBERTSON. Photographs by F. R. YERBURY.

The method of design which is so charmingly appropriate to these modest little shop fronts which are put together with a little wood or plaster, a bar or two of hammered iron, and a splash of gold or green paint, is no longer adequate in dealing with the shop front de luxe.

Paris abounds in examples of the former category. Every little modiste's or novelty shop has its brave square of frontage in gay colour, always with characteristic lettering, obviously designed by someone with taste and skill, and often the window itself has some particular little trick of illumination or display which gives it a personal distinction.

These shops are nearly all feminine in character. Here is an excellent *motif* for Mr. Trystan Edwards, “The sex problem in architectural design”; but, unfortunately, investigation shows that the most dainty and feminine of these light-hearted bits of street gaiety are the work of male decorators, no doubt the kind of Frenchman who wears one of those luxuriant Assyrian beards.

When, however, the designer tackles the problem of the more elaborate shop front, it is obvious that expression must become more sedate. In the same way that the man of wealth is apt to assume a gravity in keeping with the importance of his station and bank roll, so does the wealthy shop-keeper desire to find his activities framed by a setting from which dignity and a hint of opulence will not be lacking. The small pastry and hat shops with the gay colours are the errand boys of shop front architecture, whistling and cheerful, and occasionally impudent. But the shops of rich dealers in the quarters of the Avenue de l'Opéra and the Place Vendôme and the Rue de la Paix, are more pretentious and staid. Sleek

and opulent, they are, nevertheless, good-humoured and affable. But one cannot forget that they are the well-dressed shops, the gentry of commercial building, having their human parallel in the wearer of the silk hat, the Ascot tie, and the pearly pin.

The saving grace in these more ambitious designs is that same lightness of touch which pervades the simpler shops. But here, instead of a tendency to flippancy, the form and detail is more restrained and more enduring in its appeal of interest. It is all very well to express a passing mood in design, or even to perpetuate a mild architectural joke. But it is not safe to do so in the finest and most permanent materials, for the joke of which one will never weary has to be a very good joke indeed.

It is not an easy task to suggest in the façade treatment of a shop the type of goods which the windows are to display. A simple way would be to put up a sign, or to embody somewhere in the decoration an image of a glove, or a scent bottle, or whatever was the object giving the clue to the type of trade, and this method would probably be adopted in countries like Sweden, where the shop sign is a very popular feature of street architecture. But the French designer seems to prefer something more abstract in the way of suggestion, and it must be acknowledged that he is very successful in his results. Examine, for a moment, the “Parfums d'Orsay” shop in the Rue de la Paix (Fig. 1). Here is the scent shop de luxe, beautifully equipped within, and suggesting without that mixture of luxury and ease which cannot exist without a background of financial and social stability. There is opulence suggested, but not in any vulgar way. The richness of the material is in keeping with substance and security, but there

Fig. 3.

SINGER'S SHOP IN THE AVENUE DE L'OPÉRA. THE NAME IS ON A PROJECTING PANEL OF WROUGHT IRON, LIT FROM BEHIND BY A GLASS PANEL.

BARMANN & ARNOULD, Architects.

is no desire to overwhelm, and the customer feels comforted and flattered rather than intimidated. In the quarter in which it stands, and for the purpose which it serves, this design of Sue and Mare is in every way admirable, and from the purely architectural standpoint it is interesting in technique, colour, and detail. The tone of sienna and gilt gesso over the window apertures blends with the deep brown velvet curtains which form the backing to the goods display, and the window terminates at pavement level with very amusingly designed vent openings. Altogether a design of distinctive character and originality.

Less happy in its fenestration—no doubt imposed on the designer of the shop—in the front for Berthelot's, in the Rue du Faubourg St. Honoré (Fig. 2), where shoes are sold. Here the main note is supplied by colour: the marble is yellow, and the base, window surrounds and tympana are in a black marble veined with yellow. The awnings are of orange canvas, and the draperies to the windows are of a reddish orange, the whole effect being rich without overpowering the display of goods.

The shop for Singer's, in the Avenue l'Opéra (Fig. 3), is an example on fairly conventional lines, with the favourite *motif* of the architrave type of surround and a centre doorway. The white marble is richly veined, and all the ironwork, including the well designed over-door panel, is painted black. The colour scheme of this shop is more brilliant than would appear from the photograph, for the interior is lined with what appears to be a light yellow artificial marble or stuc. The name sign is handled in an original and effective way, projecting in front of the marble face in a panel of scrolled ironwork, behind which is an illuminated

background of glass. The effect, both in day time and at night, is very good.

Isabey's scent shop (Fig. 4) is one of those which introduces wrought iron. It is a little clumsy, but its colour (sienna and some green marble) helps one to forget the thin jambs and the rather heavy fascia, which is no doubt emphasised to avoid the awkward scale which would be set up were the shop window and the arch above to be linked into one *motif*.

Very Oriental and a trifle sugary is the luxuriant ironwork which decorates the voids of Girault's, the coiffeur of the Boulevard des Capucines (Fig. 5). The wax ladies in the window come as a faint disappointment in a setting where one would have expected to find some rich *objet d'art* detached against a background of flattering damask. The ladies are so crudely realistic with their fashionable expressions of simulated interest. For a moment one forgets that they are merely busts.

Suggesting in its blaze of glass a kind of radiant activity is the shop of Boler (Fig. 6), in the Rue de Castiglione, vendors of many articles, ranging from lighting fixtures to trunks. Here the colour is black, with the name in aluminium on the fascia; but the main effect is from the glass, which covers the stanchions and radiates in a kind of crazy quilt of white and grey tones over the band which marks the mezzanine. It is a clever treatment, capable of endless variations and possibilities; but, like all such novel ideas, it would soon lose in value if overdone, for the glass is too emphatic to treat in big surfaces as texture, and not of sufficient interest to be considered on a large scale as ornament. Boler's shop, like many of the Paris examples, suffers in its form from being grafted on to an old building; but it is full of ideas, fresh, confident, and stimulating.

Fig. 50.—ELEVATION TOWARDS ROAD OF AN ISOLATED PAIR OF COTTAGES IN A RURAL DISTRICT.

THE TWENTIETH CENTURY HOUSE

XIII.—A Pair of Semi-detached Cottages

In design it is always well to tackle the most difficult problems with the intention of solving them in the simplest manner. This simplicity, however, which is one of the hallmarks of architectural excellence, becomes ever more and more difficult to attain in the façades of houses and cottages. The reason for this is that the standard of modern housing demands the provision of many conveniences, small subsidiary apartments which were lacking in the old-fashioned plan with its few rooms of fairly equal size. In the case of larger houses, it has been found that a convenient method of giving to these small domestic offices a simple and dignified exterior is by the "recess." This device, however, involves a certain additional expense, and thus cannot always be employed in dwellings in which economy of cost is the first consideration. Various alternative methods may be suggested which help to mitigate the architectural crudity resulting from the "truthful" expression of the domestic office. Fig. 54, which is an actual example of a pair of cottages erected a few years ago, shows what utter chaos may result when modern standards of planning are complied with by designers who have nevertheless allowed the elevations "to look after themselves." To see one such façade is disagreeable enough, but when the same deplorable cottage backs are repeated a hundred times or more in a large housing scheme one has a right to question whether, in the matter of cottage design, there has as yet been established that *minimum* standard of architectural decency which, far more than individual excellence here and there, expresses a national accomplishment in the art of building. But before condemning the design of this pair of cottages, let us consider the influences which have brought it about, for it must be acknowledged that this and similar types represent a serious attempt on

the part of housing reformers to make a departure from a still worse type of house which was erected in large numbers in the mid-Victorian and late Victorian periods. I refer to the "bye-law" cottages put up by speculative builders who, at a time of great housing shortage, were content to supply the minimum accommodation considered requisite for families of small means in long dreary rows of repetitive design. A notable feature of these houses was their very narrow street frontage, their back addition which obscured the light, and the absence of even the pretence of an entrance hall, it being usual for the stairs to ascend either from the living-room or from an entrance lobby of not more than three feet square. It would, of course, have been quite possible while retaining the terrace formation, to have introduced considerable improvements, both in the planning and in the elevations of such cottages; but, on the other hand, one can well appreciate the motive of those housing reformers who were so determined to get away from the "bye-law" type of street terrace. detached houses seemed to them to be the only kind worthy of commendation. But although the detached house has certain advantages over the terrace house, that of cheapness is not one of them; and in the case of small cottages the housing reformers thought it desirable to compromise and admit into their ideal village and "garden suburbs" very large numbers of cottages which were only *semi-detached*. These pairs of cottages undoubtedly represented an improvement on the "bye-law" type, inasmuch as they lay-out admitted each dwelling to have the advantage of three external walls which could be utilised for windows, and thus there was no excuse for any of the rooms being not thoroughly well lit and ventilated. Moreover, the problem of the secondary access was settled in a satisfactory manner, for the back door

Fig. 52.—PLAN.

Fig. 51.—BACK ELEVATION. THIS CLEARLY SHOWS THE ADVANTAGE OF MAKING THE WINDOWS OF DOMESTIC OFFICES FAIRLY LARGE. THEY DO NOT DECLARE THEIR POSITION AND PURPOSE WITH UNNECESSARY INSISTENCE.

could conveniently be placed at the side of the house, and the necessity for an expensive "back road" was obviated. Again, the semi-detached formation naturally commended itself to those who were intent upon decreasing the density of houses and upon providing each house with a garden. The movement in favour of "open development" was further strengthened by the support of people whose pride was gratified when their dwellings were given some of the privileges of detachment, an architectural quality which had hitherto been characteristic of the houses inhabited by those more fortunate than themselves. The idea, however, that people who live in a terrace are less aristocratically housed than the occupants of detached "villas" is not worthy of unqualified acceptance, for while most detached houses are preferable to the by-law street, there are well-designed terraces which are just as conveniently planned and far more pleasing to look at than the majority of the villas and the semi-detached cottages which are being erected to-day.

And unfortunately the degree of detachment permissible in the small suburban house is worth very little, because the cost of street work is so great, the frontage on the road must necessarily be limited, and it may almost be said that the occupants of these pairs of semi-detached cottages have even less privacy than those who dwell in terraces. The end façades are close to each other, and people can often look into each other's bathrooms across an intervening distance of not more than ten feet. Moreover, it must be insisted that the detached house or detached block of

houses needs to be of a certain size before it can be made into an effective architectural composition, and people are not possessed of a dignified abode if the configuration of their dwelling suggests a primitive hut or a doll's house.

Figs. 50 and 53 illustrate a pair of semi-detached cottages having certain qualities of design which are perhaps worthy of examination. In the first instance it is assumed that this is an isolated pair of cottages in a rural district, and the type is not repeated in a row of similar pairs on either side of it. Thus the block is really entitled to its isolation, and is not merely pretending a country domesticity when it is in point of fact urban. In this instance we assumed that the houses have not the advantage of public sewerage, and earth closets are shown on the ground floor. The plan is simple, and provides for parlour, living-room, kitchen, scullery, larder, bathroom and coal store on the ground floor, and three bedrooms on the first floor. It will be observed that there is a small hall with space for a perambulator or bicycle, while the stairs are of easy gradient. It may be contended that the hall space on the ground floor represents "extravagant" planning, as does also the passage on the first floor, but it should be borne in mind that even this diminutive hall performs an important social and æsthetic function, inasmuch as it immediately lifts the house above the class of mean and poky dwellings so commonly built in the past; while the passage not only gives access to three bedrooms but also to two cupboards. This additional

Fig. 54.—TYPE OF BACK ELEVATION TO BE AVOIDED. THIS FAÇADE, TAKEN FROM AN ACTUAL HOUSING SCHEME, SHOWS HOW THE PATTERN OF THE FENESTRATION MAY BE DESTROYED BY THE INSISTENCE OF THE WINDOWS OF THE DOMESTIC OFFICES.

cupboard space immediately justifies the passage and enables us to regard it as a long linen-room and box-room, which, however, serves the additional purpose of a well lit and ventilated upper landing. Elevationally the design represents an attempt to solve two special problems, one of which is common to all domestic architecture, while the other specially belongs to the semi-detached cottage. The former problem concerns the proper treatment of the domestic offices. In this instance I have not resorted to a "recess," but have been content with grouping scullery, larder and closet windows in a single row of equal apertures which form an orderly pattern. The bathroom window, also, is given a vertical dimension equal to that of the other windows, and is thus inconspicuous. A comparison between the back elevation shown in Fig. 51 and the façade taken from an actual housing scheme (see Fig. 54) is sufficient to prove the advantage of making the windows of the domestic offices fairly large. When they become mere "peepholes," as in Fig. 54, they not only destroy the pattern of the fenestration, but declare their position and purpose with a quite unnecessary insistence.

The other problem presented in the design of semi-detached cottages is a very difficult one to solve. When two equal dwellings are united in a single composition, it is easy to fall into one of two errors: either the two portions are so intimately joined together and subordinated to a central architectural feature, with the result that the houses have lost their independent identity and falsely given the impression that they are one house; or else the duality of the houses is so emphatically expressed that the composition of the block is so lacking in unity as to violate one of the cardinal principles of design. In the present instance I have attempted to tread the middle path, and while grouping the two front doors under a single porch, have allowed the pattern of the windows to be obviously divisible into two equal portions.

In the twentieth century house there may be degrees of size and varieties of accommodation but the idea of social grade cannot find expression in it, for when once the æsthetic aspect of domestic architecture is understood, and when hygiene is properly subordinated to manners, all houses, both large and small, in an equal degree express the character of aristocracy.

Fig. 53.—SIDE ELEVATION.

Competition Notes

Margate General Hospital

A limited competition for plans for a New General Hospital at the corner of Victoria Road and Thanet Road, resulted in Messrs. Adams, Holder & Pearson, F.F.R.I.B.A., 9 Knightsbridge, S.W., securing first place. The cost is estimated at £50,000. Negotiations as to a suitable site are occupying the attention of the Building Committee.

Reading Cemetery Chapel

The Corporation invite architects residing or practising in Berkshire, Buckinghamshire or Oxfordshire to submit competitive designs for a chapel which it is proposed to erect in a new cemetery. Premiums: First, 50 guineas; second 25 guineas. Particulars (after May 1) from the Borough Surveyor, Town Hall, Reading. Deposit of £2 2s. Mr. Charles J. Blomfield, F.R.I.B.A., assessor, to whom designs, endorsed "Design for Chapel," are to be delivered at 13 Ashburn Gardens, London, S.W.7, not later than July 1.

Municipal Technical College, Rotherham

Designs are invited for a proposed new Municipal Technical College and School of Art at Rotherham. Premiums; First £200; second, £100; third, £50. Professor S. D. Adshead, assessor. Particulars can be obtained, not later than April 30, from Mr. J. A. Mair, Secretary for Education, Education Offices, Rotherham. Deposit of £1 1s.

Municipal Offices, Beckenham

Architects are invited by the Beckenham Urban District Council to submit designs and preliminary sketches for proposed new Municipal Offices. A limited number of such designs will be selected by the assessor, Mr. Septimus Warwick, F.R.I.B.A., and their authors invited to take part in a final competition. A premium of £100 will be paid to each competitor in the final competition. Conditions can be obtained, before April 27, from the Surveyor, Council Offices, Beckenham.

Ramsgate Station Site

A recommendation has been made by the Subcommittee that the Town Council should invite competitive designs for the lay-out and development of the old Ramsgate Harbour Station site, and that prizes of £300, £200 and £100 should be offered respectively.

Competition of Industrial Designs

By permission of the Board of Governors of the Imperial Institute, this year's Competition will be held in the Indian Pavilion of the Imperial Institute, South Kensington. Full particulars of the Scholarships and Prizes offered in connection with the Competition can be obtained from the Secretary of the Royal Society of Arts, Adelphi, London, W.C.2. Applications for forms of entry, labels, and instructions must be sent to the Secretary between May 2 and 15. Designs entered for the Competition are to be forwarded to the Imperial Institute between June 20 and 22.

An exhibition of Modern Danish Architecture is being arranged by the Architectural Association, to be held in the hall of The Art Workers' Guild, Queen Square, Bloomsbury. The exhibition will be opened on May 23 by His Excellency Count Ahlefeldt-Laurvig, Danish Minister in London, and will remain open to the public for two weeks. Further details will be announced later.

New Ways and Means

*The Editor will welcome early information of
New Plant, Materials and Fittings*

The "Magnet" Two-Way Adaptor.
(The General Electric Co., Ltd.)

A Useful Electrical Fitting

An adaptor which can be attached to any existing lampholder in order to give two outlets from one lighting point, for convenience in the use of small electrical appliances, such as fans, irons and kettles, has been placed on the market by Messrs. The General Electric Co., Ltd., Kingsway, London, W.C.2. This device, which we illustrate, is inserted in the lampholder instead of the lamp, and the displaced lamp is then plugged into the socket projecting directly downwards, whilst the adaptor supplied with the appliance in use is attached to the other socket which protrudes diagonally. The lamp itself is controlled by a small switch which is part of the "two-way" adaptor, so that when it is dark the lamp can be used simultaneously with the appliance; in the daytime the lamp can be switched off whilst the appliance is in use, or, if desired, it may be left in circuit to serve as an indicator showing that the current is on. The body of this "Magnet" Two-Way adaptor is made of moulded bakelite, and the pins which hold the fitting in the lampholder are provided with small nuts which can be tightened up to clamp the adaptor and the lampholder together.

Bituminous Paint in a Range of Colours

A bituminous paint which can be supplied in a wide range of colours, including such shades as Post Office red, and in metallic forms such as bronze and aluminium, has been introduced by Messrs. Metalpaint, Ltd., of Marlton House, Lower Regent Street, London, S.W.1. The introduction of this product is therefore a material advance in the manufacture of bituminous paints which hitherto have had a limited sphere of application owing to the fact that they were only obtainable in black, reddish brown or dark brown, and an indefinite dark green. "Facto-rum," as this new paint is called, gives a finish somewhat resembling that of an enamel paint, and is therefore suitable for work of a decorative nature. It has a covering capacity, for two coats, varying from 28 to 33 square yards per gallon, according to the surface upon which it is used, and is claimed to

"dry" in half an hour following application and to be perfectly hard after a lapse of two hours. In the case of wood it can be applied, even in its most delicate shades, directly over a coat of tar, or wood preservatives such as creosote, and will not discolour in the slightest degree. It can also be applied to concrete, without subsequent troubles from flaking; to ironwork, even where subjected to relatively high temperatures (as in the case of stove-pipes and factory chimneys) or to corrosive fumes in the atmosphere; and to timber structures immersed in sea water. It is also interesting to note that this product can be applied by spraying, and when left in bulk exposed to the air it will not "film over."

A Compact Electrical Air Warmer

Air warmers which can be fixed to the wall, either for general heating or for the purpose of counteracting draughts in the corridors of public buildings, have been added to the "Heatrae" series of electrical heating appliances which are manufactured by Messrs. Electric Fires, Ltd., of Norwich. These heaters, one of which is illustrated, are made throughout in steel, and are so proportioned that the working temperature is kept down to a safe figure, whilst a large area of steel fins is provided to dissipate the heat and cause a rapid convection of air. There is also an air baffle at the back which assists convection, throwing the warm air forward into the room. The projection from the wall is only 3½ inches in all sizes, so that the minimum amount of useful space is occupied. At present six standard sizes can be supplied, with capacities ranging from 500 watts (14 in. high x 5 in. wide) to 2,500 watts (18 in. high x 20 in. wide).

An Improvement in Lamp-holders

A new type of shade carrier lampholder, in which the usual screw ring of the standard lampholder is replaced

The "Heatrae" Air Warmer (Wall Type).
(Electric Fires, Ltd.)

The "Unique" Shade Carrier Lampholder.
(The Hendon Electric Lamp Co., Ltd.)

by a device which facilitates the removal of the shade for cleaning purposes without risk of breakage, is shown in one of our illustrations. This device is in the form of a spring which fits over the socket of the lampholder and locks in position by means of the ordinary pin and bayonet slot, carrying the entire weight of the shade, which it presses against the usual shoulder provided on the lampholder, and so counteracts the effects of vibration. The complete lampholder has been placed on the market by Messrs. The Hendon Electric Lamp Co., Ltd., of 104 Southampton Row, London, W.C.1. The shade carrier fitting, however, can be adapted for use on existing standard lampholders, if the bayonet slots on the latter are altered by means of a special tool which can be supplied for this purpose.

Fireproof Paints and Wood Preservatives

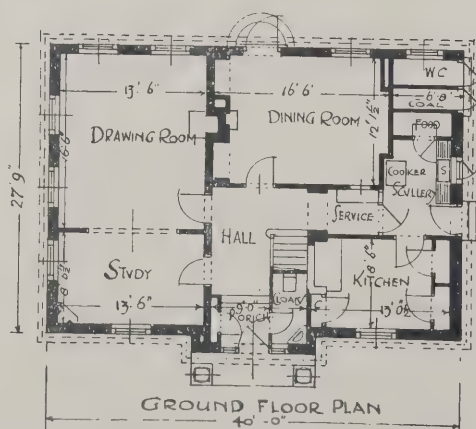

A new series of fireproof paints, which have no tendency to smoulder and are suitable for either indoor or outdoor use, have just been placed on the market by Messrs. Amalgamated Processes, Ltd., of 3 Grosvenor Gardens, London, S.W.1. These "Colardo" Fireproof Paints are also unaffected by weather conditions, and do not, therefore, lose any of their fire-resisting qualities by exposure. They are made in a wide range of colours, drying with a matt finish, which is washable and petrol-proof, and which may be varnished. It is here, again, interesting to note that the subsequent application of varnish does not lessen their factor of fire resistance, for the composition of the paint is such that it will retard the combustion of the actual film of varnish. The covering capacity is approximately 70 square yards per gallon. Associated with these paints is a Fireproof Creosote, which has the advantages of ordinary creosote without its inflammability, and which can be supplied in a series of dark colours similar to the proprietary wood preservatives which are on the market.

HOUSE ON THE QUEENSMERE ESTATE, WIMBLEDON PARK.
HAROLD E. MOSS, A.R.I.B.A., Architect.

FIRST FLOOR PLAN

GROUND FLOOR PLAN

SCALE OF FEET

The walls are 11 inches hollow, the outer skin is in purple facings with red dressings all in English bond. Roof is of Dutch pantiles. All external woodwork painted cream, stucco in Portland cement distempered and coloured in Duresco. The windows are double-hung sashes: oak floors and oak doors to principal rooms.

HOUSE ON THE QUEENSMERE ESTATE, WIMBLEDON PARK.
HAROLD E. MOSS, A.R.I.B.A., Architect.

THE STAGNANT TRADE

(Concluded)

By A LAYMAN.

One can imagine the floors of the future as consisting of some homogeneous material, some plastic development, for instance, of wood pulp, hardening with a cork-carpet surface, carried by a light steel lattice embedded in it, so that its under-surface would form a finished ceiling to the floor room below; something with the qualities of cement but without its chilly ugliness; and withal light and workable. Something of the sort is surely within the possibilities of human ingenuity, but, lacking it, there is yet plenty of scope for improvement on present methods. A massive timber platform supporting, above, a heavy wooden floor, and below, as a separate entity, a lath and plaster ceiling; occupying some nine inches or more of depth, to form a hollow sounding board, a run-way for rodents and a repository for dirt and forgotten shavings; subject to warping and shrinking, dry-rot and decay—to say nothing of fire: is that the builder's last word to us on the subject of floors? Or can he not throw off the thrall of the carpenter?

I can see no work for the carpenter in the house of the future; and little for the joiner, save superficial decoration. Because, ten thousand years ago, the first planned houses were of wood, the building trade, with characteristic conservatism, retains the wood-worker, although he is to-day an anachronism—or would be in any other trade. But the house of to-morrow will be of steel: steel-framed, with steel supports for floors and roof, steel staircases, steel windows and doors and cupboards. In one of his Utopian essays, H. G. Wells maintains that houses might be lighter built, and suggests, if I remember rightly, walls of wire netting and weatherproofed paper, rather on Japanese lines—apparently overlooking climatic differences. There is no doubt, however, that house construction is needlessly massive—our builders still cling to the tradition of the feudal fortress—and that were the deadweight of wooden floors and roofs reduced as steel would reduce them, the supporting wall would need to be no more than a slender steel skeleton with panels of weather-resisting material—though probably something more substantial than paper!

Towards the ideal of the steel house we have as yet, despite much discussed experiments, got no further than steel casement windows. But while we wait for the elimination of the carpenter, why not steel doors, or at least steel door frames, with fireproof panels of wood or composition? Why not steel cupboards and shelves, which are already commonplace of the office-furnishing trade? Above all, why not steel staircases? How often do we read, "Trapped by burning staircase!" And how often, when the inquest is over, is the house rebuilt with other than a wooden staircase? Never—nor will you find other than wooden staircases in any new-built middle class or smaller house. Yet, speaking always as an ignorant layman, I can see no possible reason—unless it be an under-estimate of the cash value of human life—why the staircase in the smallest house should not be fireproof: a steel frame with metal panels for strings and risers, and treads of impregnated hardwood.

The plasterer is at work now in this house on the Brighton Road, hiding the rough finish of his mates, the bricklayer and the carpenter; and I muse a while on his lath and plaster ceilings and partitions. What are they but the wattle and daub of prehistoric lake-dwellers, of primitive Egyptians, of our Anglo-Saxon forefathers, persisting in the "enlightened" twentieth century unchanged and unimproved: porous, hygroscopic, friable and fragile? Which

suggests the further question: by how much does the great brain of *Homo Sapiens*, as exemplified in the modern plasterer, surpass in ingenuity that of the humble beaver similarly slapping mud on wooden walls?

But since such substitutes for plaster-work as are already available do not seem to appeal to builders—it may be for quite good reasons—why at least cannot it be so done as not to require itself to be surfaced by paper, paint or distemper? What crude device is wall-paper! How really useless unless to hide and buttress bad plaster-work—perhaps to fill a demand for a crude mural decoration of bunches of roses and carrots and ribbons and parrots, lingering from the Victorian age, more among builders themselves than among the educated public, who would invariably prefer a plain distempered wall on practical, sanitary, and æsthetic grounds. At the worst it never becomes so shabby as an old wall-paper; but even the flaking and scratching which in time disfigures it might be avoided if the plaster itself were body-coloured, so as to render unnecessary a surface coat of colour. Is that impracticable?

It is curious that the self-respecting builder should scorn a plain plastered wall, where doors and windows, pictures and furniture, will give what relief is needed by the eye, while he is almost invariably content to leave a dead cold white the great unbroken expanse of the ceiling, or at best to paper it with some sallow, vapid pattern. But perhaps he feels an understandable diffidence in tackling what is certainly a difficult problem. Admittedly it is easier to ask "Is white the only colour possible for ceilings?" than to persuade a client that he will be comfortable under a black or scarlet canopy!

Presently the house is so far finished that doors, windows and fireplaces are fixed. Thanks to the insistent demand of the public for fuel economy, the modern fireplace is certainly an improvement on the old, and usually it is more artistic, compared at least with anything later than Hanoverian times. There is something for which to be grateful, for the fireplace is the focus of English domestic life; but unfortunately the improvement has come almost too late. Utopian prophets are all agreed that the house of the millenium will have no fires. It will be electrically heated, of course, by hidden coils cunningly contrived to diffuse a uniform and regulated heat. We have already efficient electric apparatus approaching that ideal, but the builder of this house has evidently never heard of it. Though gas and electric mains run along the road, waiting to be carried for cooking and lighting, a tenth of the kitchen space is wasted on a monumental range, and a large proportion of the space of every other room on expensive grates and mantels, all with their bulk of flues and chimney stacks, and complications of hearths and trimming joists and all the rest of it. The time is rapidly approaching when heating by electricity will be as possible in the remotest countryside as it is to-day in town, and as cheap as by pre-war coal; but I can see the typical builder building his fireplace and flues and stacks when the last of our economic measures is exhausted, and a blazing fire has become an ancestral legend.

However, I am inconsistent enough to hope that that will not be in my time! A radiator, by the way, means, in my bedroom; but in the sitting-room I must have my coal fire! It may be inefficient, wasteful, troublesome and dirty; but flickering, dancing, laughing ruddily, it is *alive*, a friendly thing of comfort.

fort and companionship. The best of electric fires—I would not take a battery of them for the jolly coal fire I can poke!

Another item of house finishing which has improved of late, though it is still far from the ideal, is the window—the metal casement. Its most serious fault is that it cannot be cleaned from the inside. Window cleaning should not involve either clumsy ladders or dangerous gymnastics. A properly designed window—from the cleaner's point of view—would be one of large surfaces with every corner rounded and every outside part accessible without leaning beyond the sill: a window, for instance, pivoting on a central vertical axis. To clean it would then be a matter of easy routine, instead of infrequent hazard.

Here we sound the real keynote of the house of the future—labour-saving. We hear a lot about the Ideal Home in the popular press, but it is only to be seen in an occasional exhibition. The "practical" builder will have none of it. Indeed, wasteful of labour himself, he can hardly be expected to concern himself with labour-saving for the housewife. Even such saving as is to be effected by convenient planning is often a matter of indifference to him. He will put kitchen and dining-room at opposite ends of the house. He will fix positions of scullery and bathroom to suit the plumber, not the occupant. He would as lief build a house vertically, with half a dozen cramped flights of stairs, as spread it horizontally. (In a village within a mile of where I write there are some comparatively modern houses actually with semi-basements—this amid the wide spaciousness of the Sussex downs!)

He really seems to go out of his way to provide the house-wife, or her servant, with superfluous exercise. He gives her brass taps to polish, ranges and grates to blacklead, yards of paint-work to be scrubbed, and scores of awkward corners which must be brushed out on hands and knees—or left to collect dirt and vermin and disease. No doubt "spit-and-polish" is an excellent thing—on a battleship! and perhaps a lavatory attendant is grateful for a few feet of polished pipe to amuse his leisure; but the modern housewife has neither time for needless work nor money to pay a reluctant girl to do it for her. The woman of moderate means is learning, at first perforce, and now with growing willingness, to manage with one or no servant: a condition which, despite snobbery—and the tradition-bound builder—will gradually spread upward in the social scale.

The house of the future—perhaps a distant future—will recognise this new condition. Where space allows it will be generally of the bungalow type, or otherwise will be equipped with a simple service lift. It will have fewer but larger rooms than the present house, partly because families will be smaller and almost servantless, and partly because one large room is easier to keep clean than two small ones. There will be more bathrooms, however, and a glorified housemaid's closet, although fixed lavatory basins in every bedroom will already have abolished the sloppy slop-pail.

Taps will be of porcelain, nor will there be any other metal work to polish. Door furniture will be of composition, or metal cased in wear-resisting lacquer. Except perhaps in the sitting-room, there will be no grates to clean, no fires to make, no ashes to clear away. There will be little or no paint work. Why are builders—or decorators—so inordinately fond of white paint, the bane of the scrupulous housewife? That and—for the cheaper house—some hideous shade of buff or brown seem to be the only colours on the house-painter's palette. Probably he plays white for safety—flirtation with the solar spectrum might so easily end in artistic disaster—

but the housewife pays for his austerity in hours of extra labour. However, in the house of the future all cheap wood will be stained, all good wood polished: work for the mop and the duster instead of the scrubbing brush.

All corners will be rounded and all mouldings shallow, to avoid dust-collecting angles. There will be no cracks between boards, no faulty joins between floor and skirting, cornice and ceiling. Probably floor and wall—perhaps ceiling, too—will be one unbroken skin of patent composition, its contours designed with an eye to the convenience of the vacuum-cleaner. There will be, therefore, no exposed pipework of any kind, even in the servants' quarters. (Why should it be assumed that a gas-pipe is less offensive to the housemaid's eye than to that of her mistress?) It is quite impossible to prevent dirt collecting round a circular pipe fixed hard against a wall; and the mere attempt to do so entails in a year a vast sum of wasted effort. Sanity and sanitation alike will insist on the removal of all such irritating little factors from the servant problem. The obvious objection of expense might be partly met by the somewhat unsatisfactory compromise of D-shaped pipes; but more easily and efficiently by architects and builders taking the trouble to plan and provide proper chases in the walls as they are built. At present, where pipes are to be concealed, the chases are invariably an afterthought, to be laboriously chiselled away and patchily made good in finished brickwork and plaster.

It is in the kitchen and the other "usual offices" that the house of the future will differ most radically from that of to-day. Instead of planking down inefficient stove and messy sink in any two dark, damp and inconvenient corners, house planners will provide one efficient work-room, which will be light and airy—perhaps even sunny!—with a swillable floor and walls easily cleaned: tiled, if not to the ceiling, at least with a deep dado. Except in the remotest districts, the clumsy coal range will be replaced by an electric stove, clean, cool and scientifically regulated, or at least by a gas stove. Water heating will be the function of an outside incinerator (if hot water be not in those days a public supply). In a well-lighted recess will be a large and relatively complex sink, to which soiled crockery will be transferred from the near-by dining-room hatch and there subjected to the action of swirling jets, first of some solvent, then of water, and finally of warm air, not to be touched by hand until they are removed, clean and dry, to the glass shelves and steel racks and cupboards of the pantries.

Such a work-room, though pleasant to work in, will not invite repose, so that a separate servants' parlour, with its fair share of space and aspect and sunshine, will, in any house large enough to need a servant at all, be as much a commonplace necessity then as it is to-day a vaunted luxury.

In those days domestic work will no longer be the ugly, boring, wasteful drudgery whose very terror drives young couples to boarding-house and service flat, and potential servants to the dole. With the help of the hundred labour-saving devices of electrician and ironmonger, already available or still to be invented, the future housewife will be able to manage an average house single-handed, or alternatively to employ a maid whose working hours and conditions will be those of economic justice instead of mediæval slavery. The servant problem—the difficulty of attracting girls to service—will probably disappear *pari passu* with the need of attracting them!

It may be said that there is nothing new in all this, that the labour-saving house is already a possibility. True. But it is far, far from being the commonplace fact it should be. And for that none

but the unprogressive builder is to blame. The public is as yet too handicapped by existing social and economic conditions to be able to press to fruition their vague yearnings for the Ideal Home of the exhibitions and the popular magazines. They must take what the builder gives them, and he, with a myopic eye on his profit-and-loss account, gives them what he gave their grandfathers.

That the small builder's obstinate conservatism, his utter lack of initiative, lack of any desire for initiative, for novelty, for progress, has resulted in a blank stagnation unapproached by any other of our basic trades, might indeed have been argued *a priori*. It is only too natural, inevitable. The building trade is a national monopoly, the one trade above all which is sheltered from all foreign competition. Foreign material—except, I believe, cheap joinery—is almost unknown in it, and foreign labour an impracticability. There is thus no outside spur to progress, to economy in method, to perfection in design. Any innovation is blasted from the start by doubts whether the workmen will understand it, or, if they do, if they will stand it. Invariably they refuse to do either the one or the other. Their trade unions are powerful and, with the short-sighted policy of the ill-educated, they instinctively obstruct any suggestion that curtails their opportunities of to-day, whatever the advantages that may accrue to-morrow—even to themselves.

And the masters cheerfully acquiesce in this policy of *laissez faire*. Why stir up trade strife by trying to force their men to labour-saving methods, so long as the patient public can be more easily forced to pay for the dear old familiar methods? As things are, a builder is certain of selling, before it is built, any house for which he is able to pay the wages bill, however ugly, incommensurable and costly for its size. What inducement has he then to agitate against the handicap of unimaginative building regulations; to adopt voluntarily costly machinery, as less fortunate trades have been obliged to do; to experiment with new methods and materials: in short, to embark on the unknown? Candidly, none! So he jogs along by the rule-of-thumb of his fathers and, sure of his profits, smiles benignantly on the leisurely antics of his men as with archaic tools they pile their kindergarten material into some stereotyped monument of inefficiency—for which a dozen eager buyers are clamouring.

But in a world of progress no section of it, however powerful, however sheltered, can afford to doze and dream of easy profits in the dusty museums of tradition. The house builder has been able hitherto to laugh at outside competition; but the time is coming when he will have to face competition from within, from other trades. The big contractor will adapt his methods to the smaller scale of domestic building; the engineer will pit invention and metal and machinery against the conservatism of clay and wood and hand labour; the public, the final arbiter of progress, will, once house supply begins to overtake demand, be able to make felt its growing demand for economy and for household comfort and leisure. If he does not anticipate them all, the small builder is doomed to extinction. If he will not follow the inexorable laws of evolution he will, like other unadaptable prehistoric creatures, be known presently only by his fossilised remains: "those queer old twentieth-century houses" which will amuse the antiquarian of the future!

Professional Notes

The address of Messrs. Hodgson, Lunn & Co., chartered architects, is now Somerset Hall, 201 High Street, Guildford.

The Edmonton Education Committee have under consideration the appointment of an architect as successor to Mr. Dobb.

Building News in Parliament

WESTMINSTER.

Mr. Lumley, a Unionist member, has given notice that, on a date in May, he will call attention to the progress of house building and move a resolution. If the hon. member is able to give effect to his intention, the debate ought to afford the Minister of Health an opportunity of justifying his contention, which he has repeated on more than one occasion during the present session, that the housing subsidy causes an artificial increase in the cost of building.

Labour members questioned the Minister of Health, before the House rose for the Easter recess, as to the present cost of building material, and whether, in spite of lower fuel rates, the cost of bricks, cast-iron goods, and glazed ware is higher than before the coal stoppage. Sir Kingsley Wood, who answered for the Department, said the Inter-Departmental Committee on the Prices of Building Materials keeps in constant touch with and investigates these prices. He added that he had no doubt that the committee will shortly present a report on the subject of present prices.

Some time ago two of the Weir steel houses which were erected in Scotland were destroyed by fire, which, it was reported, had been caused by the failure of the asbestos partition walls. Questioned on this subject by Viscount Sandon, the Secretary of State for Scotland said that, so far as could be ascertained, the fire was due, not to failure of the asbestos partitions, but to a small crack in the lower part of the chimney stack where the iron flue pipe from the range entered the concrete flue block. The installation of ranges in houses of this type is unusual, and steps have been taken to ensure that no similar defect exists in the steel houses that have been fitted with ranges, and that the ranges installed in steel houses erected in future will be placed in fireplace openings constructed entirely of concrete and connected direct with the concrete flues of the chimney stack.

From an answer which was given last week by the Financial Secretary to the Treasury, it appears that 500 persons have been appointed to established posts in Government departments as surveyors, architects and draughtsmen since 1920. Mr. E. Brown (who gained distinction as the Liberal who retained Leith for his party in the recent by-election) wanted detailed particulars as to their previous employment, starting salary, etc., but the Financial Secretary refused to furnish a return of this kind on the ground that the cost of the necessary inquiry would not be justified.

An unexpected interest has been shown by Lieut.-Commander Kenworthy in the yale which figures in the heraldic decorations of the restored Chapel Royal at Windsor. The yale in the Chapel Royal is shown with both horns sloping one way, whereas the ancient heraldic designs show one horn pointing forward and one backward. The spokesman of the Office of Works replied that, as the Chapel Royal is under the jurisdiction of the Dean of Windsor, the Department can take no action in the matter. Lieut.-Commander Kenworthy was persistent in demanding information, but the Speaker intervened with the ruling that the House had no jurisdiction in regard to the Chapel Royal.

Royal Institute of British Architects

THE ROYAL GOLD MEDAL FOR ARCHITECTURE.—His Majesty the King has approved the award of the Royal Gold Medal to Sir Herbert Baker, A.R.A., F.R.I.B.A., in recognition of the merit of his work as an architect. The medal will be presented to Sir Herbert Baker at the banquet of the R.I.B.A. on June 23.

AMERICAN BUILDING METHODS

The Bossom Gift: Professor Reilly's Recent Lecture

The modern system of competitive tendering has led in England to the establishment of the profession of quantity surveyors, who cast up beforehand all the materials and labour required and make a bill of it, which the contractor prices. In America this profession does not exist, yet competitive tenders are obtained. Instead, the architect makes much fuller drawings before the building starts, showing on these drawings details of such things as plumbing, ventilation, heating, as well as all construction. This means that the architect is forced to think out his scheme more completely. Mr. Bossom shows how his works out in practice. It at any rate exhibits an interesting piece of co-operative work.

"For large office buildings or apartment houses, and even hotels, and it is in these that America has specialised, once the client has selected his architect it becomes the architect's duty to recommend the economically desirable building. This is a matter of vital importance, for if he should settle on too small a proposition, it immediately invites competition by the erection of a similar building near by, possibly reducing the ability to obtain the highest rent, or if he recommends too big a structure much of it will stand vacant for a while, and ruin the investment that way.

"To hit the bull's-eye, so to speak, a thorough analysis is first made of the number of existing available offices of a similar quality, the general progress of their development, that is how the the aggregate number of such offices has been added to each year by new buildings and the poorer ones eliminated, and this is judged in relation to the increased population of the community. By charting these two items it is reasonable to suppose that the gap that will be demonstrated is a safe margin to provide for. Then comes the point at which you can increase the rent over the existing market by an educational campaign throughout the community and by giving better facilities.

"Now, the architect having been selected and with his recommendations in the hands of the client, he has to turn these figures into building facts, and the head of the office has the task of laying out his general plan—the arrangements of the offices or apartments or rooms, deciding the type of the building, as to height, according to the zoning law, and the general materials that may be employed so as to bring them within the fixed amount of investment that is allowable. All big architect's offices have a private draughting room where this is worked out, and where there are the real designers who work with the head of the office in turning the scheme into practical shape, and it is then that the work commences at a tremendous speed.

"With the general sketches all approved, a group of men, either within the architect's own office or specially employed for the purpose in a structural engineer's office, start laying out the steel frame, which, in spite of all experience, is not yet standardised, as every architect endeavours to make a slight improvement or saving over those previously built. Another group of men start on all the plans; others, who only do that type of work, start on the elevations. The plumbing men start laying out their plumbing drawings on unfinished or incompleated blue prints of the plans that have been handed to them for their work, as do also the electrical men, heating men, the bells and telephone men.

"The specification writer is working on his part, collecting his information, and in turn giving his information for the notes which have to be placed upon the drawings, and junior draughtsmen are pre-

paring the large sheets of tracing linen, printing on titles, in preparation for the tracing of the completed plans after they have been fully drawn out. The result of all this is pretty nerve-racking, but it is possible, and has often been done, to complete the entire drawings from the sketch stage to submission to contractors for, say, a twelve or twenty storey building (which are the sizes most common to tall buildings) in anywhere from three weeks upwards—six weeks to two months being about the very maximum which would be allowed for buildings of this nature. Owners who have to pay at the rate of 1,000 dollars a day interest are not particularly anxious to have an architect to delay or dream while preparing his drawings.

"It is this terrific rush that has compelled so much of the old European detail to be incorporated into the buildings, for although the head of the office may design a new silhouette or form, it is impossible for each set of men working on the drawings to be allowed to do a little designing on their own account, and so various examples are selected from the extensive libraries within the architects' offices, in order to create uniformity which otherwise would be impossible. But I think I am justified that, in spite of this, one can truthfully state that much new and quite good detail has been evolved on some of the later buildings.

"When the drawings and specifications and form of contract (the latter more or less tentative) have been completed, about half a dozen or more contractors are allowed to submit an estimate, usually on the completed building or upon the building exclusive of what are termed the utilities, which are estimated upon separately. The utilities consist of the elevators, the electrical work, the plumbing, heating work, and ventilating work. A number of estimates are invited from a series of contractors along these lines at the same time, and the contractors are usually allowed now more time than they used to be to make these estimates. Years ago it used to be about a week or ten days, now it is more than two or two-and-a-half weeks.

"The general contractor does very little of his own work, except in the case of a few big firms. His own work, if any, is rough brickwork, rough carpentry, general labourer work, and sometimes face brickwork, but all the rest he sub-lets, and the entire United States is literally sitting on his doormat to give him estimates if times are at all slack. For this an almost unlimited number of copies of the drawings and specifications are required.

"All the figures are due on the same day, and they do not come in many minutes before the specified hour, so that the contractor's estimating clerk, on the night before the opening of bids, usually spends the entire night compiling his figures and checking up the various sub-contractors' estimates to see that no two men have included the same item or that nothing has been omitted. Then he foots these up, as it is called, or, in other words, adds up all the totals, adds on the office expense, the contractor's own supervision costs, and often then cuts off as much as 10 per cent. and sends that in as his estimate. This sounds, of course, a paradox, but they have found by experience that if they can trade or bargain with their sub-contractors when they actually have the job themselves, they can very materially reduce their figures, so much so that they cannot only cut out this percentage but have yet a very substantial profit to themselves."

Life in an American architect's office, as Mr. Bossom has described it, is obviously not a bed of roses, at least for the assistants. My own experience, and the experience of my students, who enter these offices for a short spell each year in increasing numbers, is that in spite of the rushes which occur occasionally, more time is spent in the study of the building before the final plans are drawn than is usual in England. There are often a number of partners, and they hold a competition among themselves. The design is kept in a fluid state as long as possible so as to receive all possible criticism and embody all good suggestions. The much larger staff of draughtsmen in an American architect's office means that when the scheme is settled the actual working drawings can not only be made at much greater speed but with much greater detail.

Coming now to the organisation of the actual building work, the introduction of the steel frame has made possible the application of the Scottish method of building from the inside outwards on a vastly increased scale. Each floor can be completed directly the steel is in place, and can become both a store house of materials and a workshop. As the external walls are carried on the steel equally with everything else, they can and are built in sections, and do not have to rise everywhere at the same time. With their greater heights of building, American builders have had to give up the external scaffold and do everything from the inside, or from slung boats wound up by winches. These boats are covered in and heated in winter. The plumbing, ventilating shafts, and pipes of all kinds go up with the steel work, which is rendered possible by the very accurate working drawings and careful setting out on the plans of all such details. This method of building with the steel frame as a workshop means a very much extended working face. Hence the extraordinary speed achieved. Here Mr. Bossom again on this point:

"The system is that every sub-contractor has to make a complete set of drawings of his work, giving the complete detail and dimensions of everything that he intends supplying. These have to be checked by the architect to see that every one fits with every other one, and it is no unusual thing to have as many as 10,000 drawings of various forms and kinds before a job is completed. If these can all be checked and returned, and all the workmen made to work, all the various details will come with great speed in sequence to the building.

"As to the erection of the steel, the steel columns are always made two storeys long, *i.e.*, going up through two floors each time—this being technically known as one lift, and on a swift moving building it is not at all unusual to lift the derrick, which signifies the completion of two floors, twice a week; in other words, four floors of steel are erected but not fully riveted per week, the riveting gangs following on behind, in very direct connection with the derrick men.

"As to the brickwork. About three floors a week of this or a floor every two days is about the best satisfactory speed, for the brickwork has to be carried floor by floor on the steelwork, and if greater speed than this is adopted it is found difficult to maintain the proper gauge with the joints of brickwork.

"As to the floors. We now try and hang our centres for the concrete directly from the steel frame by bolts which afterwards can be pulled out, or by some tin-pan or inter-locking tile system, forming a tile arch, so that none of the old methods of supporting one floor of concrete from the floor below are employed. The riveting gangs go up at the rate of about four floors a week behind the derrick men of the steel erection, and this indicates how quickly floors have to be installed."

How are we to adapt these methods to English practice if it is desirable that we should? First it is obvious that English work, both from the architect's and the builder's point of view, is much more individual in its character, much less standardised. The architect certainly does not take so much of his detail from the books in his library. It would probably be better in the majority of cases if he were more of a scholar and knew more about old work. But this is no reason why he should not make more complete working drawings and study his building beforehand in all its aspects and details as thoroughly as his American colleague. Assuming, however, the architect has done that, and produced as perfect a set of drawings as possible, is there anything the builder can do to make his organisation of the job more efficient? It is here indeed I think most can be learnt from America. The best contractors on that side have an excellent system by which they draw up before the building starts a time schedule or chart showing exactly when all materials are to come on to the site and when each portion of the work is to be finished and each sub-contractor to clear up and go. This chart is a very elaborate thing, going into great detail. Even such apparently small things as the exact dates between which the medicine chests in the bathroom are to be fixed are given. I have been asked by the Trustees to mention the building of the new Devonshire House because I suppose it was erected so much more quickly than is usual in this country. I think a year, possibly eighteen months, was saved to the owners by the speed at which the builders, Messrs. Holland and Hannen and Cubitts, worked. This, of course, meant a very large saving in cash, and I attribute it more than anything else to the Progress Schedule which was drawn up by them before the building started. It was made the basis of all sub-contracts, which were let on the understanding that the sub-contractors came on to the job and left it on the days specified, having made all their preparations accordingly. These contract dates were, in general, kept to. They were no doubt assisted by a system of bonuses and fines, but—and this is an important point—they could not have been carried out if the progress schedule had not been skilfully drawn up. Indeed, it seems to me largely the secret and kernel of the whole matter. To facilitate this, there were held once a fortnight meetings of all the sub-contractors, at which the schedule was produced, and all difficulties which might cause delays adjusted. The builders were able to act like this because, for this building, they were not contractors in the ordinary sense but building managers, acting in a professional capacity as much as the architects, and paid, like them, a definite commission. This at once brought the builder on to the side of the architect. He was there to help by his advice and experience, and not to make difficulties or to find extras in order to make a profit on his contract. The essence of the matter was that the builder became the architect's friend and adviser, as he was in Wren's day, and not someone to be watched night and day by a clerk of the works. I understand that there is a much better personal relationship between architects and builders in America than there is with us. Perhaps owing to our system of tendering and the very tight contracts based on bills of quantities which do not always follow the drawings very closely because the latter are not full enough, we, as architects, sometimes put the builders into unfair positions. If, however, the builder can be made into a professional man and paid a definite sum on commission for his skill in organising the work, the whole position is reversed. I am very sure such a change would not only make for better building, which in the end is more economical building, but, where speed is necessary, very much quicker work.

THE TILE FOR EVERY ROOF

Courtrai-Du Nord Tiles are easy to cut and consequently suit all types of roofs—you see them everywhere. If you will make an appointment, a qualified representative will be glad to discuss technical details.

SOLE SUPPLIERS:

ROOFING TILES

London Building Notes

BOND STREET.—Alterations are to be made to the premises at the junction of Bond Street and Grafton Street, W.1, to the designs of Messrs. Williams & Cox, F.R.I.B.A., 34 Henrietta Street, Strand, W.C. The builders are Messrs. Higgs & Hill, Ltd., Crown Works, South Lambeth Road, S.E.

BROMLEY.—A housing scheme involving the erection of 40 cottages on an estate at Bromley Common is shortly to be started. Work will be carried out under the direction of Mr. Percy A. Coad, L.R.I.B.A., 90 Nightingale Lane, Bromley.

CHURCH STREET.—A block of business premises, including flats, is to be built on a site in Church Street, Kensington, S.W. The building has been designed by Messrs. Wills & Kaula, 22 Southampton Street, W.C.1.

COCKSPUR STREET.—Foundations are now in course of construction for the new Head Offices to be built in Cockspur Street and Pall Mall East, S.W.1, for the Sun Life Assurance Company of Canada. The builders are Messrs. Trollope & Colls, Ltd., 5 Coleman Street, E.C.2. The plans have been prepared by Mr. Septimus Warwick, F.R.I.B.A., 13 Somers Place, Hyde Park, W.2, in collaboration with Mr. A. J. C. Paine, Montreal.

DEPTFORD.—New branch premises, including departmental shops, etc., are to be erected on a site adjacent to Revelon Road and Arica Road, Deptford, S.E., for the Royal Arsenal Co-operative Society, Ltd. Plans have been prepared by the Society's Architect's Department, whose offices are at Powis Street, S.E.18.

DULWICH.—Improvements, including the installation of new interior equipment, etc., are to be carried out at the Southwark Hospital at East Dulwich Grove, S.E. Plans have been prepared by Messrs. A. Saxon Snell & Phillips, 9 Bentinck Street, Manchester Square, W.1.

FINCHLEY.—A contract is shortly to be placed for the erection of a new telephone exchange in the district of East Finchley, where a site has been purchased by the London Telephone Service. Plans for the building have been prepared by H.M. Office of Works, under the direction of the chief architect, Mr. R. J. Allison, F.R.I.B.A.

GREENWICH.—The B.C. propose utilising a portion of the Greenwich Hospital Cemetery site for the erection of a maternity and child welfare centre, at an estimated cost of £3,700, for which tenders are shortly to be invited.

HAMPTON.—A contract has been placed for the building of the new Church Hall at Hampton Wick. The builders are Messrs. Bernard & Bickett, Wallington, whose tender amounted to £5,073. The architect is Mr. Jessop Hardwick, F.R.I.B.A., Eagle Chambers, Eden Street, Kingston-on-Thames.

KENSINGTON.—The Holland Park Hall, in Holland Park Avenue, W.11, is to be reconstructed. The arrangements are under the direction of Mr. C. B. Cochran.

KINGSTON-ON-THAMES.—The Licensing Justices have adjourned passing the plans of Mr. J. Hill, architect to Messrs. Hodgsons Brewery Co., Kingston, for the reconstruction of the King's Arms Hotel, Kingston, so that an alternative scheme can be submitted.

LEADENHALL STREET.—A new branch of the Midland Bank, Ltd., is to be opened in Leadenhall Street, E.C.3, in a portion of the new premises being erected for the Corporation of Lloyds. The architect to the building is Sir Edwin Cooper, F.R.I.B.A., 3 Verulam Buildings, Gray's Inn, W.C.

LEWISHAM.—Mr. Thomas Steeden, chairman of the Lewisham Board of Guardians, recently laid the foundation stone at Lewisham Hospital, High Street, S.E.13. The estimated cost is £129,000. The contract has been entrusted to Messrs. Leslie & Co., Ltd., Kensington Square, Hammer-smith, W.8. The plans have been prepared by Messrs. J. Douglass Mathews, Son & Ridley, 3-4 St. Pauls Bakehouse Court, Goddman Street, E.C.4.

LIME STREET.—Alterations are to be carried out to the branch restaurant and depot in Lime Street, E.C.3, owned by the Aerated Bread Co., Ltd., Camden Town, N.W.1. The work is being carried out by the company's building department.

MERTON.—Work is to be put in hand upon the proposed new Council School at Merton, S.W., to be built for the Surrey Education Committee. The contract has been awarded, at £12,870, to Messrs. James Burges & Son, Wycliffe Road, Wimbledon, S.W.19. The architects to the Committee are Messrs. A. W. Jarvis, A.R.I.B.A., and F. A. Richards, F.R.I.B.A., 60 Tufton Street, Westminster, S.W.1.

MITCHAM.—A building is to be erected in Mitcham for the Postmaster-General to provide for a Post Office and telephone exchange. Plans have been prepared under the direction of Mr. R. J. Allison, F.R.I.B.A., chief architect to H.M. Office of Works, Storey's Gate, Westminster, S.W.1.

NEW MALDEN.—The New Malden Parochial Church Council have decided to enlarge their buildings by erecting a new parochial hall on a site in Coombe Road, New Malden. Plans have been prepared by Messrs. Harold Bailey & Dudley, architects, 92 Victoria Street, Westminster, S.W.1.

NORTHUMBERLAND STREET.—The Governors of the St. Marylebone Home in Northumberland Street, W.1, propose to carry out improvements to their buildings, including the erection of an addition to the laundry. Plans have been prepared by Messrs. Constantine & Vernon, architects, 82 Mortimer Street, W.1.

NOTTING HILL GATE.—Work has just commenced upon the reconstruction of the station buildings at Notting Hill Gate, S.W. The builders are Messrs. W. J. Maddison, Ltd., 124 Minories, E.1. The work will be supervised by the Metropolitan Rail-

way Company, whose chief architect is Mr. C. W. Clark, A.R.I.B.A.

POULTRY.—Demolition is proceeding on a further portion of the site on which it is proposed to build headquarters for the Midland Bank, Ltd. The work is in the hands of Messrs. B. Goodman, Ltd., Haggerston Road, N. The builders are Messrs. Rice & Son, Stockwell Road, Brixton, S.W. The new building has been designed by Messrs. Gotch & Saunders, Bank Chambers, Kettering, and Sir Edwin Lutyens, R.A., 17 Queen Anne's Gate, Westminster, S.W.1.

RICHMOND.—The premises at the corner of George Street and Church Alley, Richmond, are to be pulled down and rebuilt on a new frontage, the property having been purchased by Messrs. Montague Burton, Ltd., tailors, Leeds. Plans for the new premises are being prepared by the company's architect, Mr. Harry Wilson, Kirkstall, Leeds.

STREATHAM.—Among housing schemes in progress is that promoted by Messrs. Wates, Ltd., 31 Streatham Vale, S.E.16, which contemplates the erection of several hundred houses. Plans have recently been sanctioned for 100 houses on land in Sherwood Park Road, Glenister Park Road, Hawkhurst Road, and Woodmansterne Road.

WALTHAMSTOW.—The Walthamstow Education Committee propose to carry out improvements to their Queen's Road Central Schools. The plans have been prepared by Mr. H. Prosser, architect to the Committee, High Street, Walthamstow, E.17.

**Protect the Timber
with
SOLIGNUM**

DRY ROT cannot exist where Solignum is used. Hidden woodwork is made permanently safe when treated with Solignum.

The cost of protecting the timber with Solignum is negligible compared with the cost of repairs and renewals.

*The hidden woodwork that should
be preserved with Solignum*

Ends of ridge boards built into walls.
Ends of purlins built into walls.
Wall plates and ends of joists.
Backs of skirtings, architraves,
window linings.
Backs of door frames and door
linings.
Backs of all window frames.
Floor boards laid direct on concrete

and nailed to fillets embedded in
concrete. It is absolutely essential
that fillets and floor boards
should be treated with Exterior
Brown Solignum before being laid,
else Dry Rot is bound to occur.
All roof timbers.
Ground floor joists should be treated
all over.

Regd. Trade Mark

*For protection against
Dry Rot specify Ex-
terior Brown Solignum.
For indoor staining and
Decorative work In-
terior Quick Drying
Solignum should be used.*

AN ENTIRELY BRITISH PRODUCT

RAIN cannot drive into a wall that is covered on the outside with waterproofed cement stucco or roughcast. If the wall is already wet, an immediate and permanent cure is effected by plastering *inside* with waterproofed cement mortar, and skimming with absorptive lime plaster to prevent condensation.

DAMP WALLS ARE A SERIOUS MENACE

Detailed specifications for the cure of all kinds of structural dampness, and the prevention of condensation, are in the Handbook of Cement Waterproofing—post free.

Staircase.	
1½-in. Deal tread, 1-in. riser, fixed complete per foot super	2/6
2-in. Deal strings, per foot super	2/-
Housing steps to strings each	9d.

What kind of roof?"

Client : What kind of roofing do you suggest?

Architect : Well, there is nothing better than "VULCANITE," which will give to any movements in the boards or concrete.

Client : Is it weatherproof?

Architect : Yes, and also fire resisting when sprayed with gravel.

Client : What length of life has it?

Architect : Lasts much longer than any other material I know of.

Client : But I suppose it's rather expensive?

Architect : Not at all! That's just the remarkable thing about "VULCANITE," it's cheaper and certainly better in every way. That's one thing that time has proved beyond doubt,

"VULCANITE" roofing is used under the London Building Act and the Bye-laws, etc., of all Borough and Urban District Councils; and is accepted by all the leading Fire Insurance Companies as an Insurance Tariff Roof

We shall be pleased to have your request for our Illustrated Booklet, and to supply detailed drawings and estimates free.

VULCANITE FLAT ROOFING is supplied and fixed only by

A SUGGESTION

MAY we suggest that before purchasing
Fireplace Suites or Sanitary Appliances
you and your Clients should visit our recently
re-arranged Showrooms at 17 & 18 Upper
Thames Street, London, E.C.4.

The range of Fireplace Suites offered for
inspection is a very wide one. A special
feature is the number of beautiful Period
Designs, many of which we owe to our own
craftsmen of a century ago.

The Register Grate illustrated is in Armour
Bright finish and fitted with the Hot Hearth
Fire. It is particularly suitable for office or
country house use.

BUILDING WAGE GRADES

Grade Classification	A	A1	A2	A3	B	B1	B2	B3	C	C1
Standard Rates	1/8	1/7½	1/7	1/6½	1/6	1/5½	1/5	1/4½	1/4	1/3½
Labourers' Rates	1/3½	1/2½	1/2½	1/2	1/1½	1/1½	1/1	1/0½	1/0½	-/11½

The following are the gradings of towns in England and Wales. The rates quoted apply to all craftsmen, with the exception of those marked with an asterisk, which denotes that there is a differentiation in the rate paid to painters, details of which are given separately at foot. The London rates are:—Within a 12 mile radius from Charing Cross—all craftsmen (excluding painters), 1s. 9½d.; painters, 1s. 8½d.; labourers, 1s. 4½d. From 12 to 15 mile radius, all craftsmen (excluding painters), 1s. 9d.; painters, 1s. 8d.; labourers, 1s. 4d.

THIS IS AN ABBRIDGED LIST; THE GRADINGS OF OTHER TOWNS MAY BE HAD ON APPLICATION TO THE EDITORIAL OFFICE OF THIS PAPER

"THROUGH THE SMOKE, SMOKE, SMOKE!"

"The whole country is becoming a network of mean buildings, linked up by services of motor omnibuses." This was one of many epigrams to which Professor A. E. Richardson treated his audience last Friday, and, as he was addressing the London Society, much of his discourse turned upon the British Capital, which he regarded as, at one and the same time, "a pleasant city" and "an enormity." "It has many diseases, its circulation is bad, it is dropsical, it is prone to indigestion, and it suffers from skin trouble. Where it is good, it is only middling, and where it is bad it is horrid." The text was "Modern Street Architecture," a thesis which allows a pleasant latitude for speculation, of which the Professor took full advantage. Architecture he defined as receiving its impulse from some dominant factor of social life; and on that hypothesis there are those who find in the diverse disorder of our street architecture a very striking reflection of a restless and dissatisfied social order. That Architecture expresses the social characteristics of the age that produced it was one of the chief ingredients of our earliest technical pabulum; in these days, one sometimes begins to doubt its nutritional properties, to question its applicability for the sustentation of the coming race of architects. The theory worked well enough in the old feudal days, no doubt, but in this democratic era of somewhat superficial education, when Jack is as good as his master—generally, a great deal better—and the truth "of so many men, so many minds," is strikingly apparent, one begins to wonder whether there is any social factor sufficiently dominant to be characteristic of the age or to give the necessary impulse for a coherent expression in Art.

Professor Richardson finds it in Business. Architecture has, in the past, expressed religion, autocracy and private enterprise. To-day is the great age of business. "We are," he said, "a nation of shopkeepers," and the quotation almost suggested that his mind had travelled back to the days of its utterance, to the age of our neo-classic which he so greatly admires and has so handsomely chronicled. For, were the Great Napoleon alive to-day we fancy he would more fittingly have dubbed us a nation of agents, engaged in adding half-crowns to the cost of goods that we often do not see and that other peoples have produced. While that may be business, one

may doubt whether such adjectives as "big" or "great" are reasonably applicable to it; or whether a great architectural tradition is likely to be evolved from such impulse as it affords.

London, as replanned by Professor Richardson under the spur of big business, is to be a noble City. The "invertebrate mass" is to be boned with a series of wide and noble thoroughfares; the terminal stations, moved back five miles from Charing Cross, would be linked with a ceinture railway. Wheeled traffic within half-a-mile of the City's heart would be prohibited, and pedestrian traffic speeded along on covered moving pavements. The Victorian suburbs would be rebuilt on ordered lines; new inner avenues would encircle the City and we should have zoning. Factories would be gradually grouped along the Thames side towards Tilbury, the workers housed in the uplands of Essex behind, and the City, denuded of warehouses, would become the Office Centre.

Along the new main thoroughfares, linking up existing squares and open spaces, there would be room for imaginative designs. Blocks of retail stores could be schemed with shops at three levels; provided with batteries of lifts and flying bridges to connect block with block. All this is reminiscent of H. G. Wells's "The Sleeper Wakes," but it makes pleasant reading. Through the spacious musings of the Professor's classic temperament we can recapture a little of "the glory that was Greece, the grandeur that was Rome." We like his dreams of the future London. We agree that "the architectural possibilities are vast; they are also practicable," if the last word is taken in its technical sense. It is a word, however, that, to some minds, conveys a very different meaning.

There was a popular music-hall ballad, twenty years ago, where the singer, reclining in an easy chair and lazily puffing a pipe, recounted various patriotic and uplifting visions, seen "through the Smoke, Smoke, Smoke," to the never-failing delight and approval of his audience. Somehow, Professor Richardson's discourse reminds us of that ditty; but, unfortunately, as the Professor's meditative smoke rings diffuse slowly towards the empyrean, the forms of the big business man and the irate ratepayer seem to loom up in the picture with chilling effect.

Notes and Comments

Bungalows and Bathing

According to the Berlin correspondent of *The Observer*, the inhabitants of that city are developing a penchant for the "week-end" habit, and one outcome of this has been the staging of a "Week-end" Exhibition, which includes 59 models of week-end cottages, the result of competitions for the best designs for such holiday homes. One section of these designs has been contributed by schoolboys, a prize competition having been instituted in the higher-grade boys' school, and it is recorded that these plans do their authors' every credit and, save for a more general disregard of bathrooms, are in no way behind those of the architects. The first prize for a house, to cost £150 in our money, has been awarded to a typical wooden peasant cottage, with overhanging roof to provide a sheltered porch. This is fitted with wooden benches and painted wooden furniture, and it is symptomatic of the tendency towards an open-air life that, in all the designs, bunks are considered suitable for the sleeping accommodation. Another phase of the Berlin open-air movement is the growing fondness for public bathing in the summer, crowds of men, women and children participating in this recreation at the new bathing lakes which have been constructed on the outskirts of the city. The German schoolboy architects' disregard of bathrooms is, however, significant, and British parents, whose boys betray a fondness for bathing in any pool they can find with a distaste for the ordinary ablutionary processes of the home, may now take comfort in the fact that their offspring are not singular in this respect.

Mural Tablets

The Chancellor of the Chichester Diocese, at a Consistory Court application for a faculty to erect a mural tablet in a Sussex coast town church, drew attention to the bad tradition which had grown up in regard to this kind of memorial. Many of the churches, he said, had been lumbered with ungainly and unsightly things in the past, which the present generation had to endure as best they might; and the existence of these accretions often caused great inconvenience when alterations or repairs of the fabric had to be put in hand. In granting the application somewhat unwillingly, the Chancellor said that it must not be taken as a precedent, as the walls of churches were not designed to be supports for memorial tablets. The application in this case was probably acceded to because the intended memorial was to a former vicar. It is often of interest to know the names of the vicars of a parish; but, so far as the interior of the church is concerned, they are better recorded on tablets of the kind often seen in our cathedrals, whereon the names of the various bishops and deans are set down in chronological order, with the years in which their tenure of office began and ended.

The Critical Point in City Growth

The difficulties attendant on the ever-increasing growth of London are all too apparent to those whose

duty it is to contend with them. From an article in a Sunday contemporary, it would appear that the popular press is now beginning to realise the evils of a never-ending expansion which is neither controlled nor suitably planned. Mr. Neville Chamberlain's recent warning is quoted: "There is a critical point in the aggregation of a great number of people, and once they passed that point they were bound to involve themselves in problems of housing, transport and finance, which might eventually throttle the town itself if not checked in time. London had long since passed that point." From the Minister responsible for local Government affairs, it is a serious statement, and it leads our contemporary to suggest a rather drastic removal of existing industries and institutions from the Metropolitan area. Possibly some step of this character will eventually become necessary; but it is of vital importance that it should be thought out and planned beforehand. Decentralisation has

long been an accepted theory by the advocates of garden cities; but the sites of new garden cities must be carefully selected, for new centres of population started anywhere and everywhere will only cure one evil by raising another. Zoning powers form possibly the most potent remedy, and local authorities should be possessed of them without delay. It seems inevitable, too, that some measure of responsibility should be placed upon factory proprietors in regard to the housing of their employees. In the past, industrial employers have made a point of starting works in congested districts because of the probable labour supply available; and the decisions of many firms in recent years to move out of the Metropolitan district has been due more to rising rates rather than greater convenience.

Mr. E. Guy Dawber, President of the Royal Institute of British Architects, whose election as an Associate of the Royal Academy is the subject of general congratulation.

The Wren Society

The fourth volume of the Society is now in preparation and will be issued to subscribers early in June. This volume is entirely devoted to Hampton Court Palace. The drawings of Sir Christopher Wren and Grinling Gibbons, reproduced for the first time in this volume, are of exceptional interest, and relate to the miniature Versailles that was intended even more than to the Palace as actually built. The drawings fill fifty-one collotype plates, and include a series of authenticated designs for fireplaces by Grinling Gibbons. The text comprises seventy pages of accounts, letters and official documents, for the publication of which special leave has been obtained. These papers show the difficulties and pin-pricks that Wren was constantly beset with, and throw an important light on the architect's relations with his official staff. This work can be obtained in return for the annual subscription to the Society of a guinea. A few back numbers of the Wren Society's first three volumes, dealing with St. Paul's, can also be obtained. The hon. secretary of the Wren Society is Mr. E. Duncan Hendry, F.R.I.B.A., of 53 Doughty Street, to whom all correspondence and applications for membership should be addressed.

THE GRESHAM HOTEL, DUBLIN

By G. GREY WORNUM.

After playing leading lady in the limelight of the Press for several years past, and more often, alas, in a tragic rôle, Ireland is little heard of these days by the English public.

Irish words in English crossword puzzles are the sole reminders of her existence for those people who choose such form of consolation in place of living. To the more healthy minded, a few Irish fishing stories still filter through, but gone seem the tales of Irish Wakes, Drunks, and Bulls, and all those delightful stories of quick anger, like April showers on a sunny landscape. The few Irish plays that reach England emphasise Ireland's tragic moods rather than her comedy. But the Emerald Isle, though keeping so much to itself, is quietly reconstructing and progressing.

The once fine buildings in Dublin, destroyed in anger in the last few years, are now being replaced; damaged buildings, such as the Post Office in Sackville Street (now O'Connell Street), are being restored, with the general result that some progress is being achieved.

Few cities in the British Isles possessed better examples of 18th-century architecture. The volumes of the "Georgian Society" will become a more and more valuable record as time goes on of Dublin's former glory and culture.

As change must come, however, the city is fortunate to have a building of importance designed by Mr. Robert Atkinson and his partners, and the new Gresham Hotel, opposite the old Post Office in O'Connell Street, sets a standard that must surely foster ideals among the citizens for the city's future buildings.

The hotel, as now built, has been through many changes of plans since the architects first conceived it. But though its size has been reduced by some thirty bedrooms, the exterior façade to O'Connell Street has fortunately remained as originally designed.

THE EXTERIOR

This façade, in Portland stone, relies chiefly on its simplicity and scale to express the importance of Dublin's leading hotel.

In spite of the Louis Seize iron balcony to the second-floor windows and the obvious Italian character of the central attic storey, the design is splendidly in keeping with the 18th-century tradition of Dublin, and the treatment of the central attic gives a touch of vitality that stamps the building as being of our own time, and imports individual character and freshness to the façade. This façade, moreover,

is completely in harmony with the simple 18th-century style of the interior, and the fearless equality of the upper-floor windows is a further happy expression of the plan.

The problem set to the designer of an American hotel is far easier in this respect. The many floors that would embrace these equally-spaced windows would carry a high and rich composition above, the whole composition reading as practically cap, shaft, and base.

The English architects' difficulties in dealing with such comparatively low buildings as he is invariably concerned with does not seem to be sufficiently stressed.

The site on which the hotel is built measures about 118 feet wide by 180 feet deep, facing on to a road back and front.

THE PLAN

The general plan of the ground floor, as now carried out, embraces a main entrance hall and restaurant across the front portion, with a ladies' drawing-room and French restaurant against the street on either side of the entrance.

In the centre of the site is a Winter Garden about 40 feet square, and on its right an open garden court, on to which also faces the main restaurant.

Balancing the court on the left is a large vestibule, with cloak-rooms which will eventually serve the future ballroom, which will be placed on the back of the site, axially with the Winter Garden and main entrance.

Further public rooms are situated in the basement, and comprise a grill-room, smoke-room and bar.

DECORATIONS

The large entrance hall, about 16 ft. 6 in. high and 24 ft. wide, has been kept warm in tone, the walls being finished in the manner of French stucco, with the ceiling of a

similar colour, while the floor is covered with rubber tiling in buff and orange squares. The curtains are of old gold colour.

The main restaurant to the right and the French restaurant alongside have been treated architecturally *en suite*. The large circular-headed windows are curtained with old gold colour fabric. The walls of the main restaurant are of a blue-green colour in two tints.

The mouldings and Ionic caps are picked out in French grey.

The French restaurant is almost similar, but the walls are of a greyer green. The carpets of both rooms are black and grey in colour.

The ladies' drawing-room to the left of the entrance is decorated in a grey-blue, the ornament and mould-

THE GRESHAM HOTEL, DUBLIN: DETAIL OF ELEVATION.
ROBERT ATKINSON, F.R.I.B.A., Architect.

THE GRESHAM HOTEL, DUBLIN: DETAIL OF ENTRANCE.
ROBERT ATKINSON, F.R.I.B.A., Architect.

ings being gilt. The curtains are of turquoise blue and grey, and the carpet buff.

The Winter Garden, occupying the centre of the plan, has been treated simply and with a vaulted ceiling of plaster.

The walls and ceiling are coloured a pale pinky white, which forms a happy combination to the Australian hardwood floor of a pinkish mahogany colour.

The paintwork is picked out in blue and green, the trellis work being coloured a bright canary yellow.

The bronze gold curtains are edged with vermillion, causing a happy vibration of colour against the pink walls.

All the furniture in this Winter Garden is of basket work made locally, and it has been painted in blue-grey and green.

LIGHTING

The central chandelier made by Bagués (as were the other light fittings) is particularly striking in its richness, and its delicacy considerably relieves the plain masses of the plaster vaults.

While a certain amount of light comes through the honey-coloured bowls and vases in these fittings, a great deal of direct light is thrown upon the ceilings, whence it is reflected below.

Such a light is entirely free from the least suspicion of glare. It is bright, and yet at the same time quiet and restful.

SERVICES

The hotel, in addition to the public rooms, contains several private dining-rooms. These rooms are decorated in a more *intime* style, with delicate landscape wall paper arranged in panels.

A service room, with electric lifts, extends across the two restaurants, and communicates directly with the kitchens and service rooms below.

The kitchen arrangements are on the most up-to-date lines.

All the cooking ovens and hot plates are heated from a steam boiler.

Refrigerating plant has been installed for cold storage.

HEATING

The hotel throughout, including the public rooms and every guest's bedroom, has been centrally heated by means of the panel system.

This system, which is the Richard Crittall patent, heats the walls and shows neither pipe nor radiator. In the rooms in this particular building this system has been carried further than ever before. The fibrous plaster vaulting to the winter garden has even been heated by pipes buried in it, and with complete success.

A system has also been installed whereby this heating can be completely turned off and on at will in any single room.

BATHROOMS

The upper floors of the building contain 115 bedrooms. Eight of these have their own private bathroom, and three of them a private sitting-room in addition.

A large number of public bathrooms are placed in convenient positions on each floor, and in addition a basin and running water has been installed in every bedroom.

A special feature of the plumbing has been the complete concealment of all pipes in bathrooms and w.c.'s. This is obviously a very desirable point, and is, of course, a complete novelty in Dublin, as also are the built-in baths.

Possibly, on account of extreme indifference to the installation of baths, the inside bathroom is allowed by the authorities in Dublin. Several of the bathrooms in this hotel do not open on to any court or outside air, but are ventilated by means of a duct and powerful electric fan.

THE CARLTON THEATRE

By R. A. DUNCAN, A.R.I.B.A.

Mr. Verity is our leading authority on the planning of theatres, but his ingenuity must have been taxed by this site, as the requirements of the London County Council in regard to means of escape do not make easy the planning of theatres on confined sites between party walls as here, with exits which can discharge only at the front or back.

Without either plans or sections before one, it is still possible to realise from the illustrations that he has achieved a clean and neat arrangement, and has not allowed the demands of these practical considerations to destroy his internal effect. The seating capacity is 1,250, arranged on a main floor, below ground level, a dress circle at entrance level, and a large balcony above. The greatest distance of any seat from the proscenium curtain is 80 ft. This is excellent, and an achievement, in view of the good sight-line also obtained, which even on the upper balcony does not exceed an angle of 30 degrees. There is ample head-room under the tiers, and not the slightest feeling of oppression. Acoustically the theatre is good, as one would expect from the shape, with splayed walls slightly curved on plan, on either side of the proscenium arch, a segmental wall at the back of the balconies, and a continuous flat ceiling. The stage is of ample proportions and height, and is the last word in technical equipment, capable of meeting all the requirements of the lavish productions of modern revues and musical comedies.

Foyers are provided on the Haymarket frontage, and the ample cloakroom accommodation is easily accessible.

Electrical appliances, heating and ventilation are also of the most modern type. The air inlet is through the ceiling beams, the extract at the floor levels. Here again the requirements of the London County Council called for some ingenuity. This system is not favoured by them, but in event of fire the apparatus is immediately automatically cut off, thus meeting the only objection to what is otherwise considered a most desirable method of ventilation.

Mr. Verity's great creative capacity is displayed to the full in these elements of planning and arrangement which are the essentials of good architecture. I do not suppose that his solution of the problem is faultless, but it would require considerable study of plans and sections by a theatre expert, which I do not profess to be, to make a criticism of any value.

TREATMENT GENERALLY.

Italian and Spanish renaissance details have inspired the treatment of both exterior and interior, and the handling is sympathetic and knowledgeable. I await with interest a design from Mr. Verity's hands which is as creative in detail as are his planning and general arrangement. There are, however, throughout the design, touches of personal taste and details, such as electric light fittings, which give a

freshness to the whole, and redeem it from being a mere essay in the renaissance style.

EXTERIOR.

A good pyramidal composition with a good spacing and rhythm of voids, giving a sense of solidity. It is a little overcrowded, to my mind, and a superfluous emphasis may be noted in the oval windows and in the hoods over the windows immediately below. This over-emphasis is also a little destructive of scale, and may also be noted in other elements, namely, the cornice, the second floor balcony, and the broken pediments. All these might, with advantage, have been reduced without loss of that vigour which the façades possess.

INTERIOR.

The best view of the interior is to be obtained from the front of the stalls, looking back. The sweep of the balconies, the absence of all fussiness, and the treatment of the beamed ceiling, are worthy of high praise. The little subtlety, in change of emphasis of the two balcony fronts, is of great value in the design. The view towards the proscenium is certainly less successful. The thin elliptical arch of the opening has a weak appearance which is further displayed by the tympanum which abuts harshly into the jambs without supports, and the painted decoration, which is wiry. The excuse may be that it is desirable in the interest of the stage settings to keep the proscenium arch simple. The treatment of the boxes is rather external, both in their *motifs* and scale; both the scale and character of these serve still further to show up the somewhat "mean" treatment of the proscenium arch.

On the whole, the illustrations do not do justice to this interior, as the colour scheme is delightful. The

seats and carpets are red, the mock panelling at stalls level teak colour, the walls stippled old gold, the mouldings, balcony fronts, and ceiling are various tones of old ivory. It is all harmonious and refined. The frieze at ceiling level has the ornament picked out by painting the background rust red. The two pieces of figure ornament in low relief are most happy, both in idea and position. The mock panelling has the value of giving a warm interior effect at the stalls level, but may evoke the criticism of some as being an unnecessary artificial expedient, and that the scale of this work is not properly related to the rest of the interior.

The main entrance foyer gives a very rich appearance, but is possibly a little overcrowded with ideas, in view of all the necessary features that had to be incorporated and the restrictions of size and height; the pay boxes are interesting elements in the design. The small refreshment foyer and the corridors and vestibules rely mainly on simple wall treatment in

New Ways and Means

*The Editor will welcome early information of
New Plant, Materials and Fittings*

The "Teviot" Combined Bath and Lavatory Basin, showing Pipe Connections.
(M. Cockburn & Co., Ltd.)

A Bath and Lavatory Basin in one Fixture

A bath and lavatory basin complete in one fixture, with the basin resting upon the rolled edge of the bath, where it is entirely independent of the wall and yet is of the standard height (2 ft. 6 in.) from floor level, has been placed on the market by Messrs. M. Cockburn & Co., Ltd., of Gowanbank Iron Works, Falkirk, whose London office is at Monument Station Buildings, King William Street, E.C.4. As will be seen from our sectional illustration, this combination has a marked improvement over anything of a similar nature previously introduced in providing for two complete units requiring the plumber-work of only one, a combined fitting being provided to supply water to the bath and basin independently of each other, whilst the basin waste and overflow discharges directly into the waste pipe, but do not come into contact with the bath. In this way only one hot-water, one cold-water and one waste connection are required. The bath is also parallel, standing the normal height of 2 ft., and the inside space is in no way restricted by the basin, which is placed at the foot end. To add to the general convenience of this fixture, the soap sinking is provided for in the basin portion where it is easily accessible to anyone using the bath. The suite illustrated has been specially designed for setting into a recess, for which purpose a strip is cast on three sides of the bath roll, and can be supplied either left-handed (as shown) or right-handed.

The "Teviot" Combined Bath and Lavatory Basin.
(M. Cockburn & Co., Ltd.)

A New Hard Wearing Surface for Floors

A new surfacing for factory floors which are subject to excessive wear and tear has been introduced by Messrs. The Kleine Patent Fire Resisting Flooring Synd., Ltd., of 133-136 High Holborn, London, W.C.1. This material, which has been named "Duromit," is claimed to give a surface which has the advantages of freedom from dust and being non-slippery. The aggregate used is of a mineral nature, equal to corundum (a natural abrasive almost analogous to the artificial product called carborundum) in hardness, and is finely ground and graded to produce the necessary resistance of the finished surface, using cement as the binding medium. "Duromit" must not, therefore, be confused with the so-called "steel concretes," in which graded metal particles are used as an aggregate. In the hardened state the former is essentially composed of a mass of crystalline particles which are individually interlocked with one another and held together by a binding medium produced by the interaction of the finer

"Waas" Malleable Iron Drainage Fittings.
(Walter Slingsby & Co., Ltd.)

particles of the aggregate and the particles of the cement during the actual setting operation; with "steel concretes," on the other hand, the graded metal particles are merely disseminated throughout the mass, and do not necessarily enter into the changes which come about during setting and hardening.

It is also interesting to note that the ingredients used for "Duromit" are all of practically the same specific gravity, so that the danger of an irregular mixture (which is possible where metallic particles are added) is entirely eliminated. "Duromit" can either be laid *in situ* with a cement mortar backing or used as a surface for manufactured slabs, the thickness of the surface being varied $\frac{1}{4}$ in. to $\frac{1}{2}$ in. to suit the

"Push and Pull" Latch for Loose-Boxes.
(Joseph Kaye & Sons, Ltd.)

nature of the traffic it will have to withstand. The colour of the finished surface is a light grey.

A Novel Stable Fitting

A "push and pull" latch for loose boxes has recently been introduced by Messrs. Joseph Kaye & Sons, Ltd., of 93 High Holborn, London, W.C.1. This latch, which we illustrate, has no projecting knobs which may cause injury to the horse, and even the latch bolt itself is finished off so that there are no rough edges. Unlatching, from inside the loose box, is accomplished by pushing in the flush stud; from outside the loose box, the latch is manipulated by inserting the fingers into the dome-shaped handle and exerting the necessary pull. This fitting has been standardised for a 2-in. door.

Some Refinements in Drainage Fittings

The two pipe connections illustrated are from a series of fittings in malleable iron, which have been specially made by Messrs. Walter Slingsby & Co., Ltd., of Woodhouse Road, Keighley, for the drainage scheme at the Cape Town University extensions, and are now being placed on the market for the first time. The screwed ends of these connections are socketed, so that the bore of the pipe and the bore of the connection itself are equal, and there are no dead spots or crevices which may cause the accumulation of solid matter. It will also be noticed that the inspection holes are designed to give ample room for rodding without being unsightly, and that the form of the cover still maintains the circular cross section of the pipe.

SIR HERBERT BAKER, A.R.A., Architect.

EXHIBITION OF MODERN BRITISH ARCHITECTURE

The decision of the R.I.B.A. Council to hold an exhibition of current British work each spring occasioned more than passing interest when it was announced last year. Increasing public appreciation of the importance of good architecture demanded some supplement to the rather meagre recognition which Burlington House accords to the Art; and to this fact we may attribute the staging in recent years of independent architectural exhibitions of a character which the Royal Institute, as the representative body of the profession, might well have started twenty years ago. Whether the new departure which the Institute inaugurated at Conduit Street on Tuesday last owes its inspiration to previous external effort is of little moment. Bearing in mind the difficulties besetting any professional body which embodies in its ranks very varying degrees of talent, it was a courageous move of the Institute, and courage—not always the most conspicuous virtue of governing committees—deserves to succeed. We have now in being the first of what are intended to be annual shows of current British architecture, and the character of the

work, thus set before the public, is naturally a matter of very real and vital interest.

Judged by the test of quality, we think this exhibition comes out well. That a high standard was aimed at by the Judging Committee is evident from a cursory inspection of the double line around the walls. Great care, too, has been taken by those responsible for the hanging in the arrangement and disposition of the exhibits; our only regret is that anxiety for the general visual effect has sometimes resulted in separating two illustrations of the same building that might, more comfortably, be considered together. We acknowledge, however, that in this matter of arrangement there are drawbacks whatever system is adopted.

A closer scrutiny of the exhibition reveals several points of some moment. A considerable number of the buildings shown are familiar friends. One may instance Sir Edwin Lutyens' Midland Bank in Piccadilly; Sir Herbert Baker's Harrow School Memorial; Messrs. Adshead & Ramsey's flats in Sanicroft Street, Kennington; Mr. Septimus Warwick's Canada House, Trafalgar Square; Mr. W. G. Newton's Marlborough

EYEWELL HOUSE, QUEEN CAMEL.
E. GUY DAWBER, A.R.A., P.R.I.B.A., Architect.

College Memorial Hall; Mr. C. W. Long's Victoria House, Bloomsbury Square; Mr. Cecil Howitt's successful competitive design for the New Exchange at Nottingham; Messrs. Sandy & Norris' Church at Sparkhill, Birmingham; Mr. Oswald Milne's Christian Science Church at Nutford Place; Messrs. Granger & Leathart's School at Southport and Cinema at Kensington; and Mr. Llewellyn's Radio Station at Rugby; are cases in point. They will be generally known to most architects, though not necessarily to the public, for whom, of course, the exhibition is primarily organised. Mention of Mr. Llewellyn's exhibit demands a passing commendation of the good sense of H.M. Office of Works in permitting the exhibition and publication of buildings by that Department under the names of their responsible designers. In addition to the Radio Station there is a group of excellent new post office buildings in the exhibition by Messrs. H. T. Rees, A. Bullock and Chas. P. Wilkinson, one of which, the Post Office at Horncastle, by Mr. Rees, we lately illustrated.

The President, Mr. E. Guy Dawber, is represented by two houses of the many which have earned his recent deserved election to the Royal Academy ranks. We illustrate one of them in a vein which will perhaps be less familiar to the many admirers of his art. And it may be said here that the works selected for illustration here are of some of the more striking and less known buildings exhibited, although we make no pretension to having exhausted the list of such examples. Mr. Maufe's treatment of the sculptured sign over the doorway of his bank at Putney makes an effective note in the composition.

Interior decoration is poorly represented. The Board Room at Hay's Dock Offices, by Mr. Goodhart-Rendel, is an arresting composition for which Soane seems to have supplied some inspiration. Mr. A. S. G. Butler has an acceptable design, in the classical convention for the decoration of a music room, although we could have wished he had omitted the vista over the chimney-piece; we doubt if the solidity of a chimney-breast should ever be imperilled. Lord

THE ROYAL EAR HOSPITAL, HUNTLEY STREET, LONDON.
WIMPERIS, SIMPSON & GUTHRIE, Architects.

Gerald Wellesley's marbled dining-room also looks intriguing, but little is revealed by the photograph.

There are several models. That of Portmeirion Holiday Village, in Wales, by Mr. Clough Williams-Ellis, showing a diversity of buildings grouped round two greens on a narrow peninsula will probably provoke more discussion than anything else in the exhibition. The impression one gets is that some existing old cottages have been linked up by new buildings into a general scheme, but we are far from asserting that this is the fact, and such information as we have gleaned indicates the scheme as a provisional one. Mr. Oliver Hill shows an Oxfordshire house in the rugged farmhouse manner, and the model has a quite modernistic colour scheme. Mr. John Coleridge has a model of a good house, in a quiet Georgian manner, for the Master of Dulwich College.

We do not propose, however, to give an exhaustive survey of a show which architects should see for themselves. But it is evident that the exhibition relies mainly on the work of known London men. The provinces are poorly represented, and there are few Colonial buildings, but until the Dominions and Colonies rely more upon trained architects and less upon constructional firms, they are not likely to be well represented. There is a regrettable absence of works by the younger and lesser known men, particularly the ex-school men. We are glad to note, however, the appearance of executed work by women architects, Miss Eleanor Hughes showing Fores Farm, Chelwood Gate, and, in conjunction with Miss Winifred Maddock, a Memorial Hall at Danehill, Suffolk. The absence of many familiar names in the list of exhibitors gives some assurance that the Institute has a wider field to draw upon in future years. If, as we understand, the works shown represent an appreciable proportion of those submitted, it is evident that the necessity of a high standard is tacitly admitted; but that should not deter the coming generation of architects from submitting their capabilities to the test. The exhibition continues open until June 3.

The Gresham Hotel

(Continued from p. 731)

This is the modern Continental and American system, and is entirely satisfactory and practical.

It seems, in fact, rather a pity that more advantage of this licence could not have been taken, and more private baths installed.

The management, however, considered that the provision of baths, as made, is so in excess of any other Irish hotel's accommodation that further expense in this direction would not produce sufficient return.

BEDROOMS.

The bedrooms and their corridors are picked out with separate colours for each floor. Three general colours have been employed for these bedrooms, pinky grey, grey, and pale yellow. The walls are panelled out by means of floral paper borders.

The woodwork is painted grey throughout, with mouldings picked out in one or two colours.

The bedroom corridors are distempered grey. The doors are painted a darker grey, and are picked out according to floor in blue, pink, or green.

No built-in fittings have been provided in the bedrooms, but the complete furnishing throughout has been under the direction of the architects, with the best results.

A special feature of the passenger lift that serves the bedroom floors is the patent self-levelling gear which ensures the lift stopping exactly at floor level.

The building was commenced December, 1925, and has just recently been completed; it is proposed to commence building the large ballroom at the back very shortly. This room will be about 85 ft. by 55 ft., and will have a stage at one end and a balcony on the other three sides. It may well be said of this building that it carries on the fine 18th century tradition of the civic architecture of Dublin, at the same time embodying a distinctly modern feeling in its treatment of detail in a particularly gracious manner.

The general contractors were Messrs. McLaughlin & Harvey, Ltd., Dublin, and the principal sub-contractors as follows: Steelwork, Lambourne & Co., Manchester; David Colville & Co., Manchester; heating and ventilating, Richard Crittall & Co., Ltd., London; sanitary fittings, Cosgrave & Co., Dublin; electric lighting, A. G. Brutz, Dublin; Carterazzo mosaics, Carter & Co., Poole, Dorset; revolving door, T. B. Colman & Sons, Ltd., Hove, Sussex; Bostwick gates, Bostwick Gate Co., London; kitchen fittings, Richard Crittall & Co., Ltd., London; electric lifts, Waygood-Otis, Ltd., Fetter Lane, London; vacuum cleaning installation, Sturtevant Engineering Co., London; Hyrib reinforcement, Trussed Concrete Steel Co., London; plastering, Alex. Malcolm & Co., Dublin; fire hydrants, Automatic Sprinkler Co., Ltd., Radcliffe, near Manchester; roofing tiles, Roberts, Adlard & Co., London; paints, Pinchin, Johnson & Co., Ltd.; strong room and locks, Hobbs, Hart & Co., London; fireplaces, G. Matthews, Ltd., New Cavendish Street, London; metal fanlights, Walter Macfarlane & Co., Glasgow; Luxfer metal windows and Luxfer pavement lights fitted by O'Hara & Co., Dublin; Crittall steel doors and screens fitted by Brooks, Thomas & Co., Dublin; entrance canopy, bronze hand-rails and wrought iron balustrade, Bagues, Ltd., London; wood block floors, Hollis Bros., Hull; Binal partition blocks, The Building and Insulation Co., London; marble work, C. W. Harrison & Son, Dublin; marble paving, J. Logan & Co., Dublin; rubber flooring, Chas. Mackintosh & Co., Manchester.

The Royal Institute of British Architects

At a general meeting of the Royal Institute of British Architects, held recently, the following members were elected:—

As Fellows: J. H. Beckett, H. P. Bryant, E. H. Buckingham, A. Bulloch, H. D. Hendry, P. W. Hubbard, M.A. (Cantab.), M. Lyon, D.S.C., B.A. (Liverpool), J. E. Mundell, S. P. Schooling, W. V. Betts, J. S. C. Beard, H. Byron, G. T. F. Gardner, E. Hardwick-Terry, T. F. Hawkes, A. H. Holmes, J. B. Merson, B. N. H. Orphoot.

As Associates: J. A. Black, P. Boisclair, F. J. Buckland, G. E. Bunce, J. Cannell, T. A. Collins, A. Craig, J. Creese, E. E. Edmunds, G. F. Evans-Vaughan, E. E. Fowler, A. H. Gardner, C. W. Glass, M.C., F. G. Goodif, R. H. Graddon, R. N. Guy, J. Harrison, A. F. Hope, F. L. Jackman, F. H. N. C. Kemp, J. E. Lancashire, H. W. E. Lindo, A. F. Lodge, A. Lomax, M.C., C. S. Morley, H. Overnell, J. E. Salisbury, H. Savage, J. F. L. De Silva, L. R. Stedman.

As Hon. Associate: W. Reynolds-Stephens.

The Liverpool Architectural Society

The annual report of the Council for the official year 1926-27, was recently submitted to the annual general meeting. In the course of the Report it is stated: Following the representations from the Society upon the working of the by-law by which the Society was excluded every third year from membership of the Institute Council, new by-laws have been submitted to and approved by the Privy Council. Following the recommendation of the Ministry of Health to the effect that building regulations of old standing should be revised and brought into harmony with the model codes, many revisions of building by-laws have been made. The Council have appointed a committee to deal with this subject, and it is hoped they will be able from time to time to co-operate and assist local authorities when engaged in the work. A selection from the R.I.B.A. Students' Prize Drawing was exhibited at the School of Architecture in July last.

The Carlton Theatre

(Continued from p. 736)

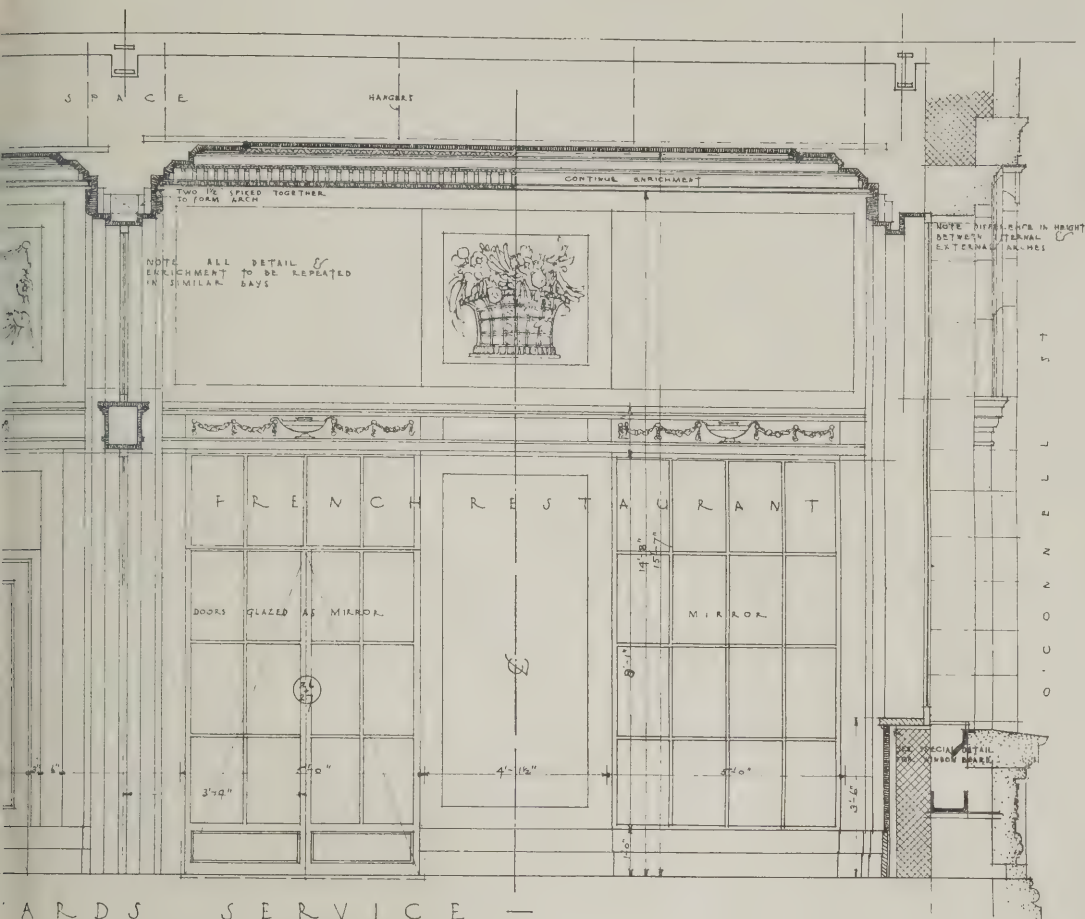

stippled colour of warm cream tones generally, and the effect is very pleasing.

We generally get something good from Mr. Verity. His work is alive and vigorous. We shall get something better and even more interesting than this important work, for his touch becomes more and more certain.

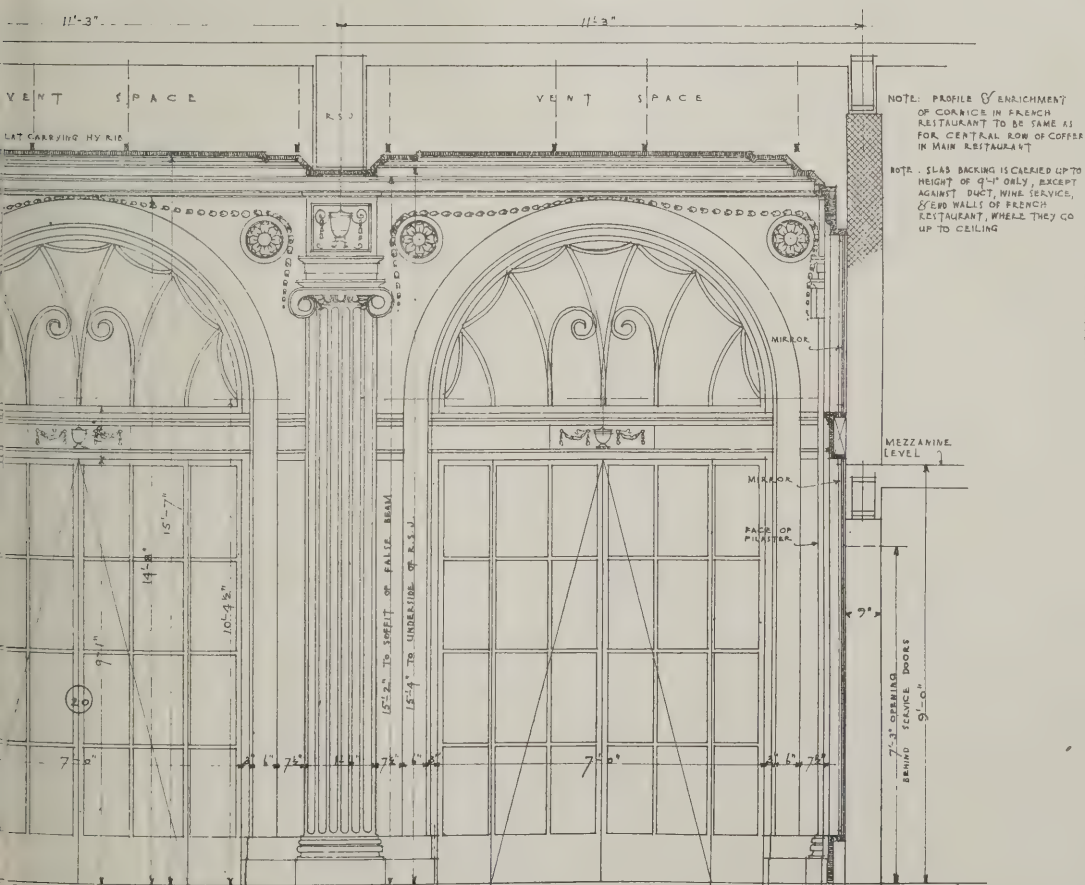

The general contractors were Vigers Limited, and the principal sub-contractors as follows: Fibrous plaster work, ceiling and wall decoration, and all decorated woodwork, Messrs. G. Jackson & Sons, Ltd., Rathbone Place, London; metal work, Comyn Ching & Co.; seating and decoration, and drop curtain, Waring & Gillow; fireproof curtain, Frank Burkitt; joinery work, Allensor Limited, Watford; glazing, Chater & Co.; stonework, Ham Hill and Doulting Stone Co.; stage equipment, Gimson & Co.; installation and fittings, Berkeley Electric Co.; stone carving, A. T. & A. Bradford; sanitary work, John Bolding & Son; heating, Young, Austin & Young; ventilation, Carrier Engineering Co.; decoration and painting, Marc Henry; marble, Fenning & Co.; tiles, Carter & Co.; ceiling, Expanded Metal Co.; pre-cast slabs and steppings, Novocrete, Ltd.; steelwork, Moreland, Hayne & Co., Ltd.; sprinklers, Mather & Platt; hydrants, Sinclair & Co.; lifts, Waygood-Otis, Ltd.

Professional Societies

Yorkshire Architectural Society

At the annual meeting of the York and East Yorkshire Architectural Society the following officers and council were selected for the year 1927-28: President—Mr. J. Stuart Syme, L.R.I.B.A.; vice-presidents—Mr. W. S. Walker, F.R.I.B.A., Mr. Alan E. Munby, M.A., F.R.I.B.A., Mr. G. D. Harbron, F.R.I.B.A.; hon. treasurer—Mr. E. A. Pollard, L.R.I.B.A.; hon. auditors—Mr. J. E. Reid, L.R.I.B.A., and Mr. S. G. Highmoor, M.C.; hon. secretary—Mr. R. Jackson, A.R.I.B.A.; Council—Mr. H. Andrew, F.R.I.B.A., Mr. W. E. Biscomb, Mr. A. B. Burleigh, Mr. J. H. Dossor, F.R.I.B.A., Mr. F. J. Horth, F.R.I.B.A., Mr. S. R. Kirby, L.R.I.B.A., Mr. L. Kitchen, F.R.I.B.A., Mr. C. Leckenby, A.R.I.B.A., Mr. S. Needham, L.R.I.B.A., Mr. A. Pollard, F.R.I.B.A., Mr. F. Porteous, Mr. J. E. Reid, L.R.I.B.A., Mr. T. Snowden, L.R.I.B.A., Mr. A. N. Thorpe, Mr. T. W. Whipp, A.R.I.B.A., Mr. S. Wilkinson, A.F.C., F.R.I.B.A.

The prizes awarded by the Society were presented as follows: Measured drawings—Mr. S. A. Suggett (Scarborough), Mr. R. A. Pratt (Scarborough); measured drawings of an old bridge of architectural interest—Mr. H. R. Stott (York); Mr. Munby's prize for the best essay on local decay of stone—Mr. J. G. Davies (York).

Correspondence

To the Editor, THE ARCHITECT & BUILDING NEWS.

SIR,—You applaud the wider recognition of the responsibilities of public authorities, evidenced by those who obtain powers to secure control of æsthetic qualities in addition to constructional and sanitary soundness, but having in view the ever-changing personnel of these bodies, is there not a serious danger that such powers will frequently be vested in people without the necessary inclinations to rightly exercise them?

An instance of the deplorable indifference to such considerations is now occurring in the fine old town of King's Lynn. There are plenty of local enthusiasts who revel in the glorious relics of its past, yet none but half-hearted protests were raised when the Town Council proposed to leave the design of its houses to be thrown in, as a make-weight, by contractors who would build them cheaply enough.

When that expedient failed they devised designs which fell below the minimum standards of the Ministry of Health and were rejected by that department. No doubt the constructional requirements that are a condition of subsidy grants will be attained, but one shudders to think of the ultimate results. If this can happen in a town which loves to do honour to the eminent architects it has cradled, what may happen in places that are without such inspiring traditions?

Yours faithfully,
"LIBRUS."

Competition Notes

Morecambe Swimming Pool

The following architects have been selected to prepare designs in this limited competition: T. H. Mawson & Son, Lancaster; Easton & Robertson, 36 Bedford Square, London, W.C.1; A. W. S. & K. M. B. Cross, 45-46 New Bond Street, W.; F. Harrison, 30 Willow Street, Accrington; Boddy & Dempster, 19 Palace Street, Westminster, S.W.; Horth & Andrew, Custom House Buildings, Whitefriargate, Hull.

Coming Events

Town Planning Institute.—Friday, April 29.—Professor S. D. Adshead, M.A., F.R.I.B.A. (Past President), on "Replanning Bloomsbury." Caxton Street, Westminster, S.W.1. 6 p.m.

The Royal Sanitary Institute.—Friday, April 29.—At a Sessional Meeting a Discussion, to be opened by Mr. J. F. Blackett, M.D., will be held on "The Housing (Rural Workers) Act." The Guildhall, Exeter. 2 p.m.

Electrical Exhibition.—Friday, April 29.—The Mayor of Stepney will open an electrical exhibition at The People's Palace, Mile End Road. 3 p.m.

Royal Institute of British Architects.—Monday, May 2.—Annual General Meeting. 9 Conduit Street, W.1.

The Society of Engineers (Incorporated).—Monday, May 2.—Mr. Oscar Brunler on "The Internal Combustion Boiler (Brunler Flame)." Burlington House, W. 5.30 p.m.

The Institution of Civil Engineers.—Tuesday, May 3.—Prof. Henry Cort Harold Carpenter, Ph.D., F.R.S., on "Some Recent Services of Metallurgy to Engineering." Great George Street, Westminster, S.W.1. 6 p.m.

Association of Architects, Surveyors and Technical Assistants.—Wednesday, May 4.—Visit to Messrs. Walkers, Parker's Lead Mills, 63 Belvedere Road, S.E. 8 p.m.

The Institution of Sanitary Engineers.—Wednesday, May 4.—Mr. F. Wilkinson, M.Inst.C.E., M.I.Mech.E., on "House Refuse Collection and Disposal." 120-122 Victoria Street, S.W.1. 6 p.m.

The London Society.—Friday, May 6.—Annual Dinner at the Hotel Victoria.

Edinburgh Architectural Association.—Saturday, May 7.—Visit to Buildings in Course of Erection in Glasgow.

Institution of Municipal and County Engineers.—The South-Eastern District Meeting will be held at Dover on Saturday, May 7. Papers: "Notes of the Earlier Housing Schemes of the Corporation," by J. A. Jarvis; "Notes on Housing in the Tower Hamlets District of the Borough of Dover," by W. Bryant; "The Pier District Improvement Scheme, Dover," by F. V. How, Deputy Borough Engineer, and W. S. Pain, Chief Engineering Assistant; "Dover: Notes on Recent Municipal Activities," by Wm. Boulton Smith, M.Sc. (Eng.), Assoc.M.Inst.C.E., F.S.I.

The South Wales Institute of Architects.—Exhibition of Photographs of Modern Buildings. The City Hall, Cardiff. May 9-14.

Institution of Structural Engineers.—Monday, May 16.—Annual Dinner. (The Rt. Hon. Lord Carson, P.C., K.C., will be the principal guest.)

Royal Institute of British Architects.—Monday, May 16.—General Meeting: "Modern Hospital Planning." (a) "English Hospitals," by H. Percy Adams; (b) "American Hospitals," by Lionel G. Pearson.

Royal Institute of British Architects.—Monday May 23.—Mr. Arthur J. Davis, F.R.I.B.A., will deliver a lecture, illustrated by lantern slides, on "The Moorish Architecture of Northern Africa." 9 Conduit Street, W.1. 8 p.m.

Town Planning Institute.—The Paper entitled "Transport," by Mr. W. H. Gaunt and Mr. Nigel Norman, will be read on May 27 instead of June 17, as previously announced, and the Annual Meeting of the Institute will be held on June 10 instead of June 17.

The Surveyors' Institution.—Monday, May 30.—Annual General Meeting. 12 Great George Street, S.W. 5 p.m.

GENERAL VIEW OF THE TWO HOUSES AT AUTEUIL: THE FURTHER OF THE TWO HOUSES IS THAT OF MONSIEUR LA ROCHE.
LE CORBUSIER & JEANNERET, Architects.

ARCHITECTURE OF THE MODERNIST SCHOOL

Some French Examples

By HOWARD ROBERTSON. Photographs by F. F. YERBURY.

There are many people who refuse to regard as architecture the buildings which are being put up in France by a group of men who are attempting to express design in the very difficult terms of modern—and particularly post-war—life. These dwellings, of cubist form, with their long row of steel windows and their corner bays, their flat roofs and their absence of ornament, are, it is argued, not only unbeautiful, but illogical, and they represent less a serious attempt at modern expression than a desire for originality at all costs. They do not make, in fact, a genuine contribution towards architectural progress; they are merely a passing fad, the expression of a modern pose.

And yet, upon a closer examination, it is difficult to sustain any criticism based on questions of principle as opposed to taste, for the type of economic French house which is at present being developed has very logical origins for all its principal characteristics.

A feature common to practically all of these

buildings is the flat roof, a system of covering which has always been popular in warm climates and which has never been considered typical of northern architecture. The only valid reason why this should be so is undoubtedly the difficulty experienced, as regards design and construction, in making the flat roof watertight, and once this problem has been solved the argument against flat roofs disappears. Not only is the flat roof a simple type to build, but it has the immense advantage of providing another storey to the house, an open-air terrace lifted above the turmoil of the streets and from which can be enjoyed views of which the occupants would otherwise never be aware.

This is the argument which has prompted Le Corbusier and Jeanneret to develop the flat-roof garden in the two houses at Auteuil, one of which, that of Monsieur La Roche, we illustrate.

In this quiet section of Paris, land, as must always be the case, is restricted and expensive, and yet the

HOUSE AT AUTEUIL: ONE OF THE STAIRCASES, WITH A VIEW OF THE OPEN HALL BEYOND.
LE CORBUSIER & JEANNERET, Architects.

PRIVATE DWELLINGS IN THE CITÉ SEURAT, PARIS.
ANDRÉ LUBCAT, Architect.

whole atmosphere of the locality suggests the possible charms of garden and planting, and there are, from this moderately elevated quarter, excellent views to be obtained from the upper storeys of the houses. What, then, could be more logical than the treatment given by the architects of this problem of providing additional garden space through utilising to the full the resources of modern construction?

These resources have made two things possible on an economic basis, the first being the flat roof, the second the raising of a portion of the house, the bow-fronted studio, on piers which allow a free open space beneath it; so that, literally, the garden flows under the house, and there is garden space where with solid retaining wall construction none would have been considered possible. The idea is simple, but it had to be thought of. In the old type of solid brick or stone construction heavy walls were necessary to support the upper storeys, and basements, damp and dark, were sunk beneath the ground. In the new frame architecture of steel and concrete, says Le Corbusier, these solid walls give way to the lightest of piers, and we may raise our houses clear of the ground and enjoy the space below. Not only may the garden pass beneath the house, increasing to a most advantageous extent the impression of openness and space, but through the wide, free openings of the windows it seems as it were to enter into the house and permeate it, to appear finally in the roof terrace which forms a charming elevated garden, combining seclusion with the maximum of light and air.

The flat roof, according to Le Corbusier, has too often in the past been faultily designed, the chief error being the system of draining it towards the outside rather than towards the centre of the house. The argument in favour of internal draining is based on Le Corbusier's experience with wide flat roofs in Alsace, where extremes of cold are frequent, and where the troubles which arise through frost are common.

In such a climate, with roofs drained towards the external walls, the heat which penetrates from the well-warmed interior of the house to the flat terrace roof becomes less intense towards the external walls, and in consequence there is, round the external perimeter of the roof, a band of more or less chilled surface which readily freezes and obstructs the discharge of water draining from the roof slopes, while within this area is formed a reservoir of water and melting snow. The result, inevitably, is that sooner or later there is penetration of the roof, either through standing water, or even, as was tragically the case in a flat-roofed cinema in Washington, a collapse of the roof under the weight of accumulated snow.

Le Corbusier applies to his own houses the guidance of his experience, and drains his terraces to the centre. Covered in asphalt, over which is laid a paving of concrete blocks or gravel, no practical difficulties have been experienced, and the roof gardens, with their concrete seats, their treillages, and their long banks of shrubs in concrete troughs, form a delightful adjunct, far more practical and utilisable than the

PRIVATE HOUSE IN THE CITÉ SEURAT, PARIS.

ANDRÉ LURCAT, Architect.

average balcony or loggia, which is nearly always both too restricted in space and too lacking in the essential of privacy.

Another feature made feasible by modern construction is the long ranges of window openings, which are just as characteristic of this French work as of modern design in Holland or Germany, while at the same time the angle window without a corner support has been developed owing to the ease with which cantilevering can be carried out with steel or reinforced concrete framing.

Both these types of windows are evolved for logical reasons. Le Corbusier probably voices a general sentiment when he says that one of the capital vital sensations in architecture is light, and that long windows, unlike narrow tall windows, do not leave large sections of the window wall in darkness. The corner window is a better solution still, for it lights the side walls adequately, it leaves plenty of space for furniture, and its head can be carried sufficiently close to the ceiling to obviate the unlit portion of wall which almost inevitably occurs over the head of the long horizontal window unless practically the whole window wall is turned into a vast window, a proceeding which has obvious objections from the point of view of privacy and loss of heat.

The houses of Le Corbusier and Jeanneret are constructed of concrete blocks 25 centimetres thick and having a cavity of 5 centimetres. The internal partitions are so light that they can stand directly upon the concrete floors without necessarily coming over a beam, and it is thus possible to frame the house on a system of a stanchion grid of 5 metres (between stanchions) without tying down room sizes to this dimension.

Walls of rooms occur where the plan requires them, and columns, when not coinciding with a wall, are allowed to pass frankly through the room or passage, as is also the case with the terra-cotta flue pipes,

which may be seen running up through the rooms independently of walls in the same way as would a stanchion.

The same general principle occurs in the houses of the Cité Seurat, by André Lurcat. There is the lightest possible construction, and all sorts of materials, including rubble and breeze, may be used for the infilling of the reinforced concrete framework.

The house for Monsieur La Roche, by Le Corbusier and Jeanneret, contains many original features, one of the most interesting being a ramp which leads from the studio to its gallery. The ramp is carpeted with a thick matting, and while it provides a magnificent descent *glissando*, it is by no means easy to ascend. There is, however, also a staircase to this gallery, and a second staircase on the far side of the three-storey hall leading to the owner's bedroom suite. These staircases have treads and risers of black tile, with a metal nosing. The concrete ramp is plastered, and light metal strips protect the arrises.

A trifle bare and uncompromising, these houses show whatever virtue lies in a clean simplicity, the shapes being entirely reasonable, and details such as the doorhoods, window boxes, balcony rails, etc., could obviously be enriched were the means forthcoming. As representing hygienic and livable housing accommodation at the lowest possible cost, these dwellings mark an advance, for not only are they a practical success, but they are good to look at. The little Cité Seurat, in which stand the houses by André Lurcat, will, when completed, be as pleasant a cul-de-sac as any in Paris, while the houses of Le Corbusier and Jeanneret appear equally at home in the prosperously bourgeois quarter of Auteuil. These latter houses have been visited by a very large number of foreign architects and artists, the visitors' book on Monsieur La Roche's table being a silent proof that this particular type of development in modern architecture is of more than ordinary interest.

Northcliffe House, in which the "Daily Mail" will live, is the greatest newspaper home this country has ever known. Everything about it that has to do with newspaper production has been selected and designed with an eye to the highest efficiency. Messrs. Herbert O. Ellis & Clarke, F.F.R.I.B.A., the architects, have chosen materials and adopted methods with only one point in view—the selection of the best. Visitors to Northcliffe House will be amazed at its vast productive capacity. The illustration on this page shows a portion of the concrete retaining wall—waterproofed with "Colemanoid"—with which Messrs. Allen Fairhead & Sons, Ltd., the contractors, started the construction of this wonderful building. My "Specifications for Mass Concrete" were followed throughout. No architect planning a retaining wall should be without a copy of them.

London Building Notes

BARKING.—The Council contemplate the erection of further residences on the Upney housing estate, and instructions have been given to the architect, Mr. C. J. Dawson (Messrs. Dawson, Son & Allardye), Clock House Chambers, Barking, for the preparation of plans.

BUSHEY.—Operations have been put in hand on the main buildings at Bushey which are to form the new schools for the Royal Masonic Institution for Boys. The completed scheme will cost £250,000 to build and equip. The contractors are Messrs. Walter Lawrence & Son, Ltd., 19 Finsbury Square, E.C.2. The architects are Messrs. Davies & Emanuel and Henry C. Smart, 73a Queen Victoria Street, E.C.4. The quantity surveyor is Mr. Walter Lawrence, 13 Hart Street, Bloomsbury, W.C. The consulting engineers are Messrs. Albion T. Snell & Partners, 5 Laurence Pountney Hill, E.C.4.

CAMBERWELL GREEN.—The "Empire" Theatre at Camberwell, S.E., has been purchased by Mr. S. Beney, the cinema proprietor, who proposes to re-open the building as a picture theatre.

CHELSEA BASIN.—The Great Western Railway Co. are to build new offices at their depot at Chelsea Basin, S.W. The building will be erected by the Building and Public Works Construction Co., Ltd., County Works, Swindon, to the plans prepared by Mr. P. E. Culverhouse, architect to the railway company, at Paddington, W.2.

CHURCH STREET.—New shop premises, with flats above, are to be erected on a site in Church Street, Kensington, S.W., for Messrs. Harvey Sites, Ltd.

CROYDON.—A site in High Street has been secured by Mr. A. Davies, of the Marble Arch Pavilion, in Oxford Street, W.1, who proposes to build a new picture theatre. It is proposed to expend a sum of £250,000 upon the new property.

EUSTON ROAD.—Excavations for foundations are now being dug for part of the buildings in Euston Road, N.W.1, projected by the Board of the Elizabeth Garrett Anderson Hospital for Women, under their £100,000 extension scheme. The plans for the new wards and maternity home have been prepared by Sir Brumwall Thomas, F3, The Albany, Piccadilly, hon. architect to the board. The builder is Mr. Albert Monk, Lower Edmonton, E.

FULHAM.—The London Telephone Service have acquired a site in Lillie Road, Fulham, S.W., where it is proposed to build a new telephone exchange. Plans are being prepared by H.M. Office of Works, Storeys Gate, Westminster, S.W.1, under the direction of the Chief Architect, Mr. R. J. Allison, F.R.I.B.A.

GRAVESEND.—A housing scheme is to be carried out on a large estate at Gravesend, and plans have been approved for the erection of 114 houses. The architect is Mr. J. G. Bennett, L.R.I.B.A., 5 Woodville Terrace, Gravesend.

HAMPSTEAD.—A grant has been made by the L.C.C. towards the proposed enlargement of the Institute of the Hampstead Garden Suburb, N.W.10. The new buildings will cost £42,000. The plans have been prepared by Mr. C. E. Hanscombe, F.R.I.B.A., Station Approach, Sanderstead, Surrey, in conjunction with Mr. H. G. Crothall, F.R.I.B.A., Middlesex Guildhall, Westminster, S.W.1. The elevations to the new block have been drawn by Sir Edwin Lutyens, R.A.

HIGH STREET.—It is proposed to pull down the old property at Nos. 89-99, High Street, Croydon, and to build a block of premises, on a lease to be granted by the Corporation. The building will consist of six shops, with a billiard hall above. The builders are Messrs. Marcus Estates, Ltd., 9 New Bridge Street, E.C.4.

HOLBORN CIRCUS.—Work is in progress upon the extensive modernisation of the large emporium in Holborn Circus, W.C.1, of Messrs. Thomas Wallis & Co., Ltd., drapers, etc. The contractors are Messrs. Woodward & Co., 13 Wilson Street, E.C.2. The plans have been prepared by Messrs. Yetts, Sturdy & Usher, 115 Moorgate, E.C.2.

ILFORD.—A site has been secured at Ilford by the local United Methodist Church, upon which it is proposed to build a church and schools at a cost of about £12,000. The new building has been designed by Messrs. George Baines & Son, F.R.I.B.A., 121 Victoria Street, Westminster, S.W.1.

KENSINGTON.—A block of residential flats—to be known as Church Close—is to be built on a site in Church Street, S.W., adjacent to the new showrooms of The Gas Light and Coke Co., Ltd. The plans have been prepared by Messrs. Yates, Cook & Darbyshire, 43 Great Marlborough Street, W.1. The builders are the Canonbury Construction Co., Ltd., Canonbury Works, Canonbury Street, N.1.

KING'S CROSS.—The Cecil Houses Committee, it is stated, are acquiring a property in the region of King's Cross, N.W.1, which they intend to open shortly as a "Cecil House" hostel in November. Adaptation will be carried out under the direction of the honorary architect.

OLD BROAD STREET.—The National Provincial Bank, Ltd., of 15 Bishopsgate, E.C.2, are to open a new branch office at No. 21 Old Broad Street, E.C.2, as soon as the proposed extensive reconstruction plans have been carried out. The bank architect is Mr. F. C. R. Palmer, F.R.I.B.A.

REGENT'S PARK.—A block of flats is to be built on the site of Abbey Lodge, near Hanover Gate, Regent's Park, W.1. The owners are Messrs. Ernest Yates & Co., 37 New Bond Street, W.1.

RICHMOND.—Steelwork is now in course of erection on the site in George Street of the restaurant, shop and garage to be built for Messrs. Edwards & James, Ltd., dairymen. The builders are Messrs. Truett & Steel, Ltd., Thornton Heath, Croydon, the contract being valued at about £12,000. The steelwork is being supplied by the London and Wales Steel Construction

Co., Ltd., 4 Greville Street, E.C.1. The plans for the restaurant have been prepared by Mr. F. T. Dear, A.R.I.B.A., architect to Messrs. United Dairies, Ltd.

ST. MARYLEBONE.—Plans are now in course of preparation in connection with the projected demolition and clearance of old property in the vicinity of Carlisle Street, W., and the erection of modern blocks of flats and houses. The scheme is estimated to involve about £1,000,000. The architects are Messrs. H. V. Ashley and Winton Newman, 14 Grays Inn Square, W.C.

STREATHAM.—A new school is to be erected on the Furzedown Estate at Streatham, S.W., the cost involved being about £15,000. The builders are Messrs. Soole & Son, Ltd., Dunstable Works, Sheen Road, Richmond, Surrey. Plans have been prepared by Mr. G. Topham Forrest, F.R.I.B.A., County Hall, S.E.1.

VICTORIA.—A start has now been made upon the superstructure of the restaurant and offices to be built in Wilton Road, S.W.1, for the Aerated Bread Co., Ltd. The steelwork is being erected by Messrs. Archibald D. Dawnay & Sons, Ltd., Steelworks Road, Battersea, S.W., and the general contractors, Messrs. Ford & Walton, Ltd., 254 High Road, N.W.8, have also started on the building work. The architects are Messrs. William Woodward & Sons, 15 Great James' Street, W.C.

WEMBLEY.—A new hospital is to be erected at Wembley for the Wembley Cottage Hospital Committee. The architect is Mr. Herbert Kirchington, A.R.I.B.A., 44 Bedford Row, W.C. The builders are Messrs. Arbore, Ltd., 32 Theobalds Road, W.C.1. The cost is estimated at about £20,000.

WEST END.—Plans have been drawn up, and several sites are under consideration, in connection with a proposal to build a new concert hall in the West End. The cost is estimated at £400,000. The promoter is Mr. Lionel Powell, of a West End firm of concert agents.

WEST HAM.—It is proposed to entirely rebuild the "Empire" in West Ham Lane, E.15, and to re-open it as a modern picture theatre. Plans have been prepared by Mr. Cecil Masey, 19 Devereux Court, Strand, W.C., acting on behalf of the Empire Kinema Circuit, 197 Wardour Street, W.1.

WESTERN DISTRICT.—Messrs. Pritchards Restaurants, Ltd., 13-15, Wardour Street, W.1, are negotiating for the purchase of bakery premises in the Western district of London. Negotiations are also proceeding for the acquisition of suitable premises in various districts for adaptation as branch restaurants.

WOOD GREEN.—A site in Hampton Road, Wood Green, has been acquired by the Middlesex E.C., who have in view the erection of a school for secondary education. Plans will be prepared by Mr. H. J. Crothall, F.R.I.B.A., Middlesex Guildhall, Westminster, S.W.1.

The Week's Building News

The following abbreviations are used: U.D.C. for Urban District Council; T.C. for Town Council; R.D.C. for Rural District Council; E.C. for Education Committee; B.G. for Board of Guardians; P.C. for Parish Council; B.C. for Borough Council; M.H. for Ministry of Health; M.T. for Ministry of Transport; C.B. for County Borough; B.E. for Board of Education. Direct confirmation should be obtained before commitments, for which we cannot be responsible, are made.

ABERGELE.—The U.D.C. are to erect 22 houses on the housing estate.

BASINGSTOKE.—In order to provide more adequate accommodation at the Park Premet Mental Hospital, it is proposed by the Committee of Visitors to build a new nurses' hostel. Plans for the building are being prepared by Messrs. Gutteridge & Gutteridge, Portland Street, Southampton.

BEDLINGTONSHIRE.—The U.D.C. are to erect 50 houses at Cambois, Northumberland.

BIRMINGHAM.—It is proposed by the Education Committee to carry out the remodelling and enlargement of the Elementary School in Osler Street, at a cost of £22,000. The architect to the Committee is Mr. T. H. Buckland, F.R.I.B.A., Norwich Union Chambers, Congreve Street, Birmingham.

BIRMINGHAM.—The Midland Electric Manufacturing Co., Ltd., propose to make extensions to their premises in Basford Street. The architect is Mr. H. S. Scott, 115 Colmore Row, Birmingham; contractors, Messrs. George Webb & Son, Ltd., Soho Hill, Birmingham.

BIRMINGHAM.—Messrs. W. Butler & Co., Ltd., Springfield Brewery, Birmingham, are to erect a public-house to serve the new Featherstone and Hilton housing estates. Mr. William Arthur Hutchins, architect.

BLACKPOOL.—The Blackpool Co-operative Society, Ltd., propose to make alterations to their premises in Counce Street, Blackpool. Mr. Walter Wade, L.R.I.B.A., architect, Bank Chambers, St. Annes-on-Sea. Messrs. W. H. Parker & Son, contractors, Oxford Avenue, St. Annes-on-Sea.

BOLTON.—The Westminster Bank, Ltd., have acquired the Silver Vat Hotel, Deansgate, Bolton, as a site for a new branch bank. Messrs. Potts, Hemmings & Topham, architects, 141 Bradshawgate, Bolton. Tenders have not yet been invited, and no contracts are placed.

BRADFORD.—New Sunday schools are to be erected on the Graveyard site. Mr. B. Dobson, architect, Rushtol Works, Thornbury, Bradford.

BRIGHTON.—A complete rebuilding of the "Golden Cross" at Western Road has been approved by the licensing authorities upon the application of the Rock Brewery (Brighton), Ltd. Plans for the new building have been prepared by Messrs. Thomas Garrett & Sons, architects, Ship Street, Brighton.

BRIXTON.—The steelwork for the garage in Effra Road, Brixton, is being erected by H. Young & Co., Ltd., Thornycroft House, Westminster, S.W.1. The builders are F. & H. F. Higgs, Ltd., Hinton Road, Herne Hill, S.E.24, and the building has been designed by Mr. Gerald Shenstone, architect, 38 Bedford Place, W.C.1.

BUCKLE.—The Buckle T.C. have decided to build 24 three-apartment bun-

galows of a special design at a cost of £290 per house.

BUCKINGHAM.—An estimate has been prepared as to the probable cost of building the proposed boys', girls' and infants' school at Terriers. The plans include a central assembly hall, and have been prepared by Mr. T. Thurlow, High Street, High Wycombe.

CARMARTHEN.—The Corporation are to erect 26 houses on the Morgan housing estate.

CARDIFF.—The School Sites and Buildings Committee is to ask the engineer to prepare plans for a school at Ely, to cost not more than £20,000.

CATTERICK (YORKS).—An extension of the military camp at Catterick is planned by the War Office, and will involve the erection of more than 100 buildings. The contract for the work has been placed with Messrs. Sir Lindsay Parkinson & Co., at a figure approximating £350,000.

CHESTERFIELD.—Messrs. Seardsdale Brewery Co., Ltd., of Chesterfield, propose to erect an hotel at the junction of Hawkeley Avenue and Newbolt Road. Messrs. Wilcockson & Cutts, architects and surveyors, of 12 Saltergate, Chesterfield.

CHESTERFIELD.—A new chapel is to be erected at Gravelstones. Mr. W. A. Derbyshire, architect, Glumangate, Chesterfield.

COVENTRY.—The E.C. propose to build a new school at Radford. Messrs. G. Steane, architects and surveyors, Hay Lane, Coventry. It is to cost about £35,000.

CRAIGHEAD.—Mr. J. W. F. Phillipson, architect, Lloyds Bank Chambers, West Street, Gateshead, is preparing plans for a new cinema. Estimated cost, £6,000.

DUNFERMLINE.—The Dunfermline Established Presbytery have approved plans for the erection of a new church at Rosyth, estimated to cost £6,200.

FULWELL.—The Vicar of St. Michael and St. George Church, Fulwell, has appointed Mr. Harold Gibbons, F.R.I.B.A., Abbey House, Westminster, as architect for the proposed reredos in the church. Messrs. Boulton's, of Cheltenham, will undertake the structural portions. The estimated cost of the work is £2,000.

GLAZEBURY.—Mr. W. Potts, builder, Holcroft Lane, Glazebury, near Manchester, is to erect 67 to 70 houses on a site off Holcroft Lane. The lay-out and plans have been prepared by Mr. J. E. Newell, L.R.I.B.A., architect, 290 Oxford Road, Manchester.

GREENFORD.—The Ealing T.C. have instructed the surveyor to negotiate for a site for a maternity and child welfare centre adjoining the site on which it is proposed to erect the Greenford School.

KEYFORD.—Frome U.D.C. are to erect 48 houses at Keyford, Somerset.

LANCASTER.—The Corporation are erecting 792 houses at an average price of £338.

LEEDS.—New workshops and offices are to be erected, at a cost of £110,000. Mr. G. W. Atkinson, architect.

LIVERPOOL.—The Yorkshire Insurance Co., Ltd., are to erect new offices on a site at 18 Chapel Street. Messrs. T. Wainwright & Sons, architects, 11 Lord Street, Liverpool.

LLANTARNAM.—Forty houses are to be erected by the U.D.C. at a cost of over £18,000.

LONDON.—Mr. Alban H. Scott, F.R.I.B.A., has prepared plans for the new premises of the "News of the World."

MANSFIELD.—The M.H. have approved of a grant to the Mansfield T.C. for the erection of a further 100 houses, making a total of 724.

MANSFIELD.—It is proposed to erect a new addition to Brunts School. Messrs. Vallance & Westwick, architects, White Hart Chambers, Mansfield.

MANSFIELD.—It is proposed to erect a new church on a site on the Bull Farm estate. Neither architect nor contractor has yet been appointed.

NELSON.—Lancashire E.C. are now to proceed with the provision of a secondary school at Nelson, plans having been prepared by Mr. Stephen Wilkinson, F.R.I.B.A.

NEWBURY.—It is proposed to carry out alterations and improvements to the "White Horse" hotel, owned by Messrs. Crowley & Co., Ltd., brewers, Alton, Hants. The cost is estimated by the architect, Mr. B. D. Cancellor, Queen Anne Chambers, High Street, Winchester.

NEWCASTLE-ON-TYNE.—Messrs. J. W. Taylor & Son, architects, St. John's Street, Newcastle, have a scheme in hand for the erection of a warehouse for Messrs. Nausenbaum & Son, Sandgate Street, Newcastle.

NEWHEY.—The designs submitted to the Milnrow U.D.C., by Mr. A. Traves, architect and surveyor, Union Bank Chambers, Rochdale, for their housing scheme, have now been approved.

NORTHAMPTON.—A new building is to be erected at Mersers' Row to the plans prepared by Messrs. Home and Knight, A.A.R.I.B.A., architects, 27 Russell Square, London, W.C.1.

OLDHAM.—Messrs. C. T. Taylor, Roberts & Bowman, architects, 10 Clegg Street, Oldham, are preparing plans for the erection of a new Sunday school in Old Street, Oldham.

PLYMOUTH.—The Governors of the East Cornwall Hospital propose to extend their premises in Greenbank Road, the cost being estimated at £50,000. Plans are now being prepared by Mr. E. Stanley Hall, F.R.I.B.A., 54 Bedford Square, W.C.1.

PRESTON.—Mr. G. E. Bolshaw, 106 Lord Street, Southport, has been appointed architect for a new chapel, which is estimated to cost £7,000.

READING.—A site at Shinfield has been selected by the T.C. for the erection of a new council school, and plans

The Hall Mark of Your Craftsmanship

IN our preceding announcement we have endeavoured to point out something of the ideals in Craftsmanship that go in the making of "Crabtree" Products—the same ideals as were an all-impelling force to the old-time Craftsmen.

We have ever affirmed that these ideals are a vital factor in the Industries of to-day—that the standard of quality in each component part of an electrical installation, for example, reflects the good taste of those responsible for the selection of the accessories used. During the few short years in which "Crabtree" Products have attained a distinctive position in the Electrical Industry, we have asked no favours, but have simply given of our best in inspiration and research—in sincere quality and tested efficiency, with the result that it is more than ever realised that the "Products of Craftsmen" set the seal of excellence on each installation.

A Hallmark of your Craftsmanship—the products of

"Craftsmen
in Electrical Switches"

are in course of preparation. The architects to the Education Committee are Messrs. Charles Smith & Sons, 164 Friar Street, Reading.

RISCA.—The U.D.C. propose to erect 200 houses on the Ty Isaf site.

RUSHALL.—Subject to the approval of the M.H., the Walsall R.D.C. are to erect a further 40 houses on land in Pelsell Lane, Rushall.

SEDGEFIELD.—A new Primitive Methodist Church is to be erected at Broom. Mr. Thos. W. T. Richardson, architect, F.R.I.B.A., 57 High Street, Stockton-on-Tees. Estimated cost, £6,000.

SHEFFIELD.—The Sheffield E.C. have decided to erect an elementary school at Pipworth Road by direct labour, at a cost of £48,000.

SPALDING.—The directors of the National Provincial Bank, Ltd., London, have given instructions for the branch premises in the Market Place to be reconstructed and enlarged. An elevation to conform with local architectural features is to be provided for. The chief architect to the bank is Mr. F. C. R. Palmer, F.R.I.B.A.

ST. NEOTS.—Sanction has been given by the Electricity Commission to the erection of a power station at St. Neots, not exceeding 12,000 k.w., by the Bedfordshire, Cambridgeshire and Huntingdonshire Electricity Co., Ltd. The engineer to the company is Mr. J. M. Ronaldson, of the Metropolitan Electric Supply Co., Finsbury Park, N.

SUTTON.—The U.D.C. are to erect 34 houses on the Ridge Road site.

TYNEMOUTH.—The Corporation are to proceed with the erection of 73 houses at Ogle Terrace, Balkwell.

TYNEMOUTH.—The E.C. are seeking sanction to borrow £11,500 for alterations to the Tynemouth Priory Council School buildings.

WOLVERHAMPTON.—Excavations are in progress on the site of the old Bell Library, where it is proposed to build the new additions to the Wolverhampton and Staffordshire Hospital. The builders are Messrs. William Sharratt, Ltd., Church Lane, Wolverhampton, whose tender amounted to £45,826. The architects are Messrs. Elcock & Sutcliffe, F.R.I.B.A., 21 Northumberland Avenue, W.C.2, and the quantity surveyor is Mr. Henry Vale, F.S.I., 16 Darlington Street, Wolverhampton.

Building Contracts Open

**** It is requested that information concerning Contracts Open, Tenders, etc., be forwarded to Rolls House, 2 Breems Buildings, London, E.C.4, not later than 2 P.M. on Tuesdays. The date given at the beginning of each paragraph is the latest date when the tender or the names of those willing to tender, may be sent in; the name and address at the end is the person from whom quantities, forms of tender, etc., can be obtained.*

AMMANFORD.—May 11.—For the taking down of existing buildings and the erection of a new Calvinistic Methodist Chapel (Bethany, vestry,

and other contingent works, Ammanford. Mr. J. Owen Parry, F.S.I., etc., architect, Arcade Chambers, Ammanford. Deposit £2 2s.

CO. LEITRIM.—May 4.—For the erection of 8 houses at Carriek-on-Shannon, Co. Leitrim. R. E. Beckerson, Chief Clerk, Irish Sailors' and Soldiers' Land Trust, 30 Lower Fitzwilliam Street, Dublin. Deposit £5 5s.

CHELMSFORD.—May 5.—For the erection of 4 cottages at Pleshey. James Dewhurst, engineer and surveyor, Council Offices, Waterloo Lane, Chelmsford.

CHORLEY.—May 2.—For the erection of eight type "A" houses at Coppull, and four at Whittle-le-Woods. W. Cotterill, Council Offices, High Street, Chorley. Deposit £2 2s.

DERBY.—May 4.—For the erection of a Secondary School on the Elm Tree House Estate, Uttoxeter Road, Derby. Messrs. Macpherson & Richardson, Education Office, Becket Street, Derby.

DEVON.—May 11.—For renovations, etc., at the undermentioned Council schools: Bradford, Brattonfleming, Chivelstone (East Prawle), Chudleigh, Dawlish West (Cockwood), Ermington, Great Torrington, Highampton, Inwardleigh, Kingston, Molland, Moretonhampstead (Greenhill), Moretonhampstead (Pound Street), Ringmore, Teignmouth (Shaldon), West Down. The County Architect's Office, 97 Heavitree Road, Exeter.

DURHAM.—May 23.—For the general builder's work required in the erection and completion of the Fishburn new Council School. Mr. F. Willey, F.R.I.B.A., 34 Old Elvet, Durham.

DUBLIN.—May 7.—For the erection of No. 12 houses (in pairs) in Malahide Road, Dublin, for the Dublin Commercial Public Utility Society, Ltd. Messrs. McDonnell & Dixon, F.R.I.A.I., 20 Ely Place, Dublin. Deposit £3 3s.

EDINBURGH.—May 2.—For the erection of new kitchen, steward's store, laundry, power house and garage at Gogaburn Institution. Mr. Stewart Kaye, A.R.I.B.A., 14 Hill Street, Edinburgh. Deposit £2.

FROME.—May 7.—For the erection of 48 houses at Keyford, Frome. Mr. P. B. Rigg, Cork Street, Frome. Deposit £2 2s.

GLAMORGAN.—May 9.—For the following works: (1) new school at Rhiwbina, near Cardiff; (2) teacher's house at Rhydri, near Caerphilly; (3) Mining Institute at Bridgend; (4) levelling playgrounds, retaining walls, play-shed, etc., at the Rhiwfawr Council School, near Ystalyfera. Mr. T. Mansel Franken, Secretary of Education Committee, Glamorgan County Hall, Cardiff.

GLASGOW.—May 7.—For plumber work in connection with the erection of 36 houses at Craigton Road, Milngavie. Rob. Kyle, 104 West George Street, Glasgow. Deposit £1 1s.

HADDINGTON.—May 16.—For the erection of additions and alterations to Macmerry Public School, near Tranet: Excavator, brick and mason work, joiner, carpenter and glazier works, plumber work, slater and rough cast works, painting work, heating installation, tar macadam pav-

THE TRUSCON FLOOR

IN REINFORCED CONCRETE

BIRMINGHAM MUNICIPAL BANK, ERDINGTON.

City Engineer and Surveyor: H. H. HUMPHRIES, M.I.C.E.

Contractors: JOHN T. HARRIS, LTD.

TRUSCON FLOORS WERE CONSTRUCTED THROUGHOUT.

It is the primary duty of a floor to carry efficiently the loads which may come upon it. Of the other duties of a floor the least spectacular but the most useful is that of accommodating the "domestic services." The Truscon floor will do this.

Most buildings require gas and electric light, electric bells, telephones, and water supply. Heating systems, either radiator or "panel," have to be allowed for, and sprinklers or ventilating systems are often required. The Truscon floor has an accessible hollow space in which all these services can be effectually concealed.

BEFORE PLACING YOUR FLOORING CONTRACTS CONSIDER
THE ADVANTAGES OFFERED BY THE TRUSCON FLOOR.

NANTWICH.—Erection of houses in various parishes for the R.D.C. Mr. H. Crabtree, engineer. Messrs. Gresty & Sons, six houses at Wrenbury, £2,800. Mr. J. W. Platt, of Shavington, six houses at Dodecote, £2,775, four houses at Cholmondeston, £1,900; four at Chorley, £1,900; six at Wrenbury, £2,745; four at Checkley, £1,820. Mr. Charles Parker, of Beeston, four at Alraham, £2,355. Mr. James Farnell, Ash, six houses at Dodecote, £2,467. Mr. George Brookes, Bunbury, four houses at Alraham, £1,945 13s. 10d. Mr. T. L. Kendall, Audlem, six houses at Dodecote, £3,781.

NOTTINGHAM.—The Notts E.C. have accepted the tender of Mr. H. James, Jun., of Station Street, Mansfield, at £43,897, for the erection of the new secondary school at Highbury Road, Basford. Mr. L. Maggs, Shire Hall, Nottingham, County Architect.

Trade Publications

We have received from Messrs. Self-Sentering Expanded Metal Co., Ltd., of 112 Cannon Street, London, E.C.4, an interesting brochure on the construction of suspended ceilings, using Double-mesh Herringbone Metal lathing, which is one of the specialities of this firm. Six examples, selected from recent contracts and typical of the various classes of work falling under this heading, are herein illustrated and described. Detailed sketches, showing the actual constructions adopted, are given in place of the usual photographers' publications, and due acknowledgment is made in each case to the architects concerned.

Rural Industries

The following is the schedule of the forthcoming Rural Industries Exhibition to be held, under the auspices of the Hertfordshire County Council, Rural Industries Sub-Committee, at the Hertfordshire Agricultural Show, Hatfield Park, on June 9.

SMITH'S SECTION.—Class 1.—Agricultural implement or part of an agricultural implement. Class 2.—Wrought iron gate or panel of fencing. Class 3.—Scroll work. Any of the following articles: Bracket or frame-work suitable for trade sign, lantern, etc.; brackets for door porch, candelabra, gas or electric light fittings. Class 4.—Door fittings. Any two of the following: Door hinges and hooks (plain or scroll), not exceeding 30 in. in length, knockers, letter flaps, handles or latches, bell pulls, bolts, or one boot scraper. Class 5.—Fire dogs, fire baskets, fire-iron rests, set of fire irons, trivets, fire screens, umbrella stands, log tongs, etc. Class 6.—Any fancy or decorative iron-work not mentioned above (e.g., church furniture and fittings, weather vanes, sconces, candlesticks, toasting forks, etc.). Class 7.—Any plain iron-work not mentioned above (e.g., window frames, gutter brackets, faggoting bills, garden implements, etc.). Class 8.—Any of the articles specified in Classes 1 to 7 inclusive, made of wrought iron, and acetylene welded. Class 9.—Any article of cast iron, repaired by acetylene welding.

WHEELWRIGHT'S SECTION.—Class 10. Pair of wheels, wheelbarrow, or hand cart. Class 11.—Wooden field gate or hand gate, ladder or pair of steps. Class 12.—Any kind of wheelwright's work not specified in Classes 10 and 11 (e.g., cow crib, sheep trough, portable fowl house, etc.).

SADDLERY SECTION.—Class 13.—A cart bridle or a trade bridle. Class 14.—To be arranged. All saddlers will be notified. Class 15.—Non-competitive display arranged by the Herts Master Saddlers' Federation. Full particulars can be obtained from Mr. A. Dean, Herts Institute of Agriculture, Oaklands, St. Albans.

British Legion Housing

The British Legion are shortly to start upon a scheme for erecting houses in various parts of England and Wales to be occupied by disabled and ex-Service men. The country has been divided into 11 areas for administration, and the houses will be erected in groups according to local needs. The whole of the organisation of the scheme is being carried out by the headquarters of the British Legion, and the architects are Messrs. Thomas & Wood, who were formerly Housing Commissioners of the Ministry of Health.

Change of Address

Messrs. Arthur Vigor, Ltd., builders and contractors, of 20 Knightsbridge, London, S.W.1, have changed their address to 25 Knightsbridge. Their telephone number remains the same as before: Sloane 2114.

AN ANNOUNCEMENT OF GREAT MOMENT

AUTOMATIC HOT WATER

At Every Tap in the House
and
LIGHTNING QUICK—PIPING HOT—
CLOCKWORK SURE!

On May 2nd, 1927, the Ruud Manufacturing Company, Limited, will introduce to this country the famous Ruud Gas Water Heaters, made completely from British materials, completely by British labour. At their works at Slough—which cover a single floor space of 30,000 feet—there are now manufactured Ruud Water Heaters in every size and for every purpose—domestic, business and institutional.

Established since 1889 in the United States of America, the Ruud Manufacturing Company, Limited, through expert research and by concentration

solely upon the problem of absolutely efficient water-heating, has perfected a system which is the safest, simplest, surest in the world.

Hundreds of thousands of homes have known for years the unvarying comfort and satisfaction that the Ruud gives, and in this country the news that RUUD heaters are to be manufactured and placed on the local market has created enormous interest.

The simplicity of the Ruud makes other methods old-fashioned and laborious. Its heating power makes every other system seem puny and inadequate. The Ruud is unique.

RUUD GAS WATER HEATERS

In all enquiries for details, discounts, trade terms and demonstrations, kindly address:

THE RUUD MANUFACTURING COMPANY, LIMITED,
(Dept. A), 99 High Holborn, London, W.C.1. Telephone: Chancery 8347.

The Ruud Instantaneous Automatic Water Heater supplies an unlimited quantity of hot water, heating it instantaneously when the demand is made, and governing the temperature according to the amount of hot water required. It is equipped with a double fuel control—one gas valve regulated by the water flow the other by the temperature of the hot water.

The Ruud Automatic Storage Heater heats water and stores it in a tank from which several taps may draw simultaneously at the same rate as the cold water flow. Gas is used only when the temperature of the water in the tank is below a predetermined point.

In Tudor Times

BRICKS and TILES were the principal materials used in building construction. The many charming old Tudor Mansions and Farmhouses still existing are a standing testimony to the charm of the blending colours and shades, the nice proportions, and the durability of this method of construction.

Buildings of to-day will go down to future generations as noble examples of our time if good English Facing Bricks and Hand-made Roofing Tiles are specified.

A very fine selection is always to be seen at the Showrooms of

W. T. LAMB & SONS,
Brick & Tile Manufacturers and Merchants,
43 Shoe Lane (Holborn Circus), E.C.4

Telephone: Central 9091 (5 lines).
Telegram: "Resold, Phone, London."

Whiting Gilders ..	3/-	Cwt.

Book Notes

Library Planning. By Walter A. Briscoe. (Grafton & Co., London, 1927.) Price 8s. 6d. net.

A compilation designed to assist in the planning, equipment and development of new libraries, and the reconstruction of old ones.

Sewage Works. By F. C. Temple, M.Inst.C.E. (Crosby Lockwood & Son, London, 1927.) Price 5s. net.

The septic tank and filter described in Part I of this little work are the bare essentials for biological purification of sewage for populations of fifty and upwards. Varieties of elaborations and refinements in septic tanks are described in Part II. The book deals with the disposal of the sewage when it arrives at its destination, and not with the sewers by which it is brought there.

The Safety of St. Paul's. By The Rev. S. A. Alexander. (John Murray, London, 1927.) Price 2s. 6d. net.

This book tells the story of the preservation of the Cathedral since 1913. Containing a number of popular addresses on subjects connected with St. Paul's, as well as the official reports on which the work has been based, it is intended not only for architects and engineers, but for all who care for the great Cathedral or have contributed to its preservation.

The Art of Decorative Painting. By Walter Bayes. (Chapman & Hall, London.) 21s. net.

The Witness of the Great Pyramid. By Basil Stewart. (The Covenant Publishing Co., Ltd., London.) 12s. 6d. net.

Essays on Old London. By Sydney Perks. (The Cambridge University Press.) Price 12s. 6d. net.

Shakespeare Memorial

It has been recently announced that Prof. George Baker, of Yale University, America, is to take a million-dollar share in the international movement to rebuild and endow the Shakespeare Memorial Theatre at Stratford-on-Avon. Local committees are now being formed in 21 major cities throughout the United States to raise \$500,000 of the sum during the remainder of 1927. In all \$2,500,000 will be raised throughout the world to complete the plans of the new theatre and its associated dramatic school, festival company, museum and library.

The Hospitals and Institutions Exhibition

This exhibition and conference has been organised by the Incorporated Association of Hospital Officers with the co-operation of the British Red Cross Society, the Association of Hospital Matrons, the Institute of Hospital Almoners, the Institute of Engineers-in-Charge, etc. It will be held at The Royal Horticultural Hall, Westminster, S.W.1, on May 26, 27 and 28, 1927. Offices: 46 Strand W.C.2.

Swedish Sculpture

The closing date of the Exhibition of Works by the Swedish sculptor, Carl Milles, at the National Gallery, Millbank, has been extended to 6 p.m. Sunday, May 1.

* * *

Among the interesting remains discovered by Mr. Donald Atkinson in the excavations of the Roman fort at Ribchester, near Blackburn, were the floors of the heating chambers of baths, with the pillars supporting the bath chambers above.

REGIONAL PLANNING

The importance of Regional Planning is in inverse proportion to its mental attraction. Perhaps that is why, as Professor Adshead told the Architectural Association, architects do not take sufficient interest in the subject. To deal with the layout of one small estate is one thing; to visualise that lay-out in its relation to a scheme extending, it may be, over several counties, is quite another matter. No doubt, it is the case that architects "are not allowed" to take an interest in Regional Planning, that it is easier "for the work to be carried out by officials of local authorities"; but we doubt the Professor's contention that it "is merely an accident" that architects are not more freely engaged on these planning schemes. It must not be forgotten that the inception of town and regional planning schemes lies with the local authorities, who have their salaried engineers and surveyors, accustomed to designing and constructing roads, and that authorities are chary of incurring additional expense in engaging architects to do work, the practical aspect of which is more apparent to them than the aesthetic. For we fear that present activity in preparing town and regional planning schemes, much as we rejoice to see it, is due more to traffic difficulties, arising out of the growth of motor transport, than to a real appreciation of the benefits that will accrue from the good planning of developing districts. In these matters, one cannot escape the British obsession for the practical, to the exclusion of any other, consideration. So that until the psychological factor is allowed to have play, the architect's contribution is not likely to be recognised nor the best results achieved.

Undoubtedly, town and regional planning needs the collaboration of architect and engineer just as surely as a public memorial demands the joint efforts of architect and sculptor. Local authorities may give heed to gratuitous advice tendered by local or national art bodies, or even amend schemes on strong representation from the more enlightened and artistic ratepayers; but until they seek the active co-operation of the architect, he can hardly be blamed for taking but a languid interest in the matter.

For it is not easy to get into the "skin" of such work. To take an ordnance survey sheet and rule lines upon it is the least part of the business. Before that stage is reached the whole district concerned must be very thoroughly surveyed and noted; the character of local industries and conditions investi-

gated; transit facilities ascertained; and the incidence and extent of local and through traffic calculated. In other words, a mass of statistical information and other data must be accumulated before one can begin; and few can undertake this as a labour of love. One may study underlying theories as a hobby, but, without the opportunity of practically applying them to actual conditions, interest necessarily wanes or becomes tepid.

Encouragement must come first, therefore, from the local authorities if architects are to be, as Professor Adshead avers, "the responsible agents to the community for all that is seen above ground," although why, in this connection he exempts factory chimneys and telegraph poles, we are at a loss to explain. The factory chimney has often been an architect's responsibility, and some kind of precedent for the telegraph pole was established when a distinguished living architect was asked to design our telephone kiosks.

Vitality important as Regional Planning is to the community, it needs real enthusiasm and intense application to visualise all the aspects of a scheme, the concrete reality of which one may never live to see, and the full benefits of which will alone be realised by unknown posterity. Communities like the new Delhi, or like Canberra, which has its Royal inauguration on Monday, are blessed by coming into existence nobly planned, saved from the recognisable faults of past haphazard development. Here, we have not the good fortune of virgin soil; and, as Professor Adshead pointed out, we have to disentangle mushroom growth that often, in situations unsuitable for a community, sprang into existence through favour of some industrial factor which no longer obtains. Sources of power and raw material are not constant. Deposits of ore once made an iron industry on the Kent and Sussex border, but it went north to be beside the coal pits. Now that coal is being developed in Kent, will that iron industry come south again? Will cutlery desert Sheffield because water power for grinding has been superseded by other forms of energy? Such interesting speculations intrigue our experts and liven the routine of their work. Their abilities are hailed on the Mediterranean littoral, in the cities of South America, in that vast microcosm that centres on Manhattan Island. Would that these prophets of ours had attained more honour in their own country!

Notes and Comments

Cheaper Houses

Sir Kingsley Wood, at a luncheon of the Metropolitan Building Societies' Association last week, committed his Department to the belief that the cut in the Government subsidy last October had appreciably reduced the cost of small houses. In support of that theory, he adduced the average cost of non-parlour houses for the quarter ending December last, which was £448, and compared it with the corresponding figure for the quarter ending March last, which was £424, a reduction of £24, roughly the amount of the cut. If Sir Kingsley is justified in his contention that "the higher the subsidy, the higher the cost of the houses," the Government contribution should be abolished without more ado. We should hesitate to adopt such a course, however, without hearing the considered and unfettered opinion of the responsible officials who deal with these matters, for the statements of prominent politicians are sometimes coloured by preconceived opinions and prejudices. The Housing Authorities of Cheshire and Lancashire, at a conference, also held last week, do not seem to have found any decrease in the competitive tenders received for housing work; nor has the London County Council, apparently, experienced this desirable manifestation as a result of the subsidy cut. One must not overlook the fact that the last quarter of 1926 came immediately after the disastrous and disorganising effects of a coal strike and a general strike, from which, in the first quarter of this year, industry was beginning to show signs of recovery. Government intervention has maintained some kind of standard in small houses, whereas private enterprise, in the past, has shown that it can provide the poorer classes of our population with nothing better than over-crowded and jerry-built slums.

The Decay of Stone

Scientific research has so clearly demonstrated the widespread activities of micro-organisms in the scheme of things that it is not surprising to learn that stone has its own particular species of bacteria. Their existence is, probably, the most notable fact emerging from the Report of the Stone Preservation Committee, appointed by the Building Research Board of the Department of Scientific and Industrial Research, which has just been issued (price 1s. 3d. net) by H.M. Stationery Office. The causes of stone decay have been investigated along two different lines, of which the biological aspect has been conducted by Professor S. G. Paine. So far, research has only demonstrated the existence of micro-organisms, to the extent of 12 different species, but it is not yet possible to formulate any considered opinion on the question whether they do or do not play a part in disintegrating processes. That is a matter for further investigation. Mr. Scott Russell, who has had charge of the chemical, physical and geological aspect of the problem, has been mainly occupied in devising a reliable method of cutting and mounting thin sections of specimens of decayed stone. This has now been accomplished; and the work done in the close examination of the Portland variety has convinced him that the micro-structure of building stones is of primary importance, and that the distribution of the pores in the stone is probably a preponderating factor in determining the rate at which a stone is attacked. Though conclusions cannot be drawn from this present report, it will be seen that a problem that has long worried the building industry is being tackled in a resolute and organised manner. The Stone Preservation Committee is to be linked up with the Standing Chemical

and Weathering Committee of the Department, which is engaged on analogous investigations.

A Point of Etiquette

The Observer has rather misapprehended the point of a complaint made by a well-known architect a few weeks back. The announcement in our columns of the recommendation by the Royal Institute of three architects to act as assessors in a competition for plans of additions to a technical institution, originally designed by the architect in question, drew from him a protest against the R.I.B.A. countenancing or in any way assisting the promoters to secure the services of another architect while he was alive and able to carry out the work. Our contemporary deduces from this that architectural etiquette would deprive a building owner of his undoubted right to engage the services of any architect he pleased; and argues that such a drastic contention would scarcely be advanced by even the close corporations of medicine or the law. We agree that such a claim would be bound to fail; but we hardly think the protest which we printed would be so interpreted. The architect's quarrel, as we see it, was rather with the Institute for failure to draw the attention of the promoters to the fact that the services of the architect, who successfully competed for the original building, were available to carry out additions to it. If the promoters were then unwilling to commission him, the further action of the R.I.B.A. would become a matter of some delicacy. Any attempt to boycott the competition would probably be interpreted as an attempt to deprive the promoters of their right of freedom. Inevitably, one's sympathies must be with the architect; but he is, unfortunately, not the first, and probably will not be the last, of his profession to suffer through the ignoring of a moral claim to recognition.

Street Statuary

From time to time our more erudite critics pause from their more arduous labours to admonish us about the unsuitable positions to which we relegate some of our best sculpture of the streets. Someone has discovered that an excellent bust of John Hunter, of the St. George's Hospital, is perched on the gateway of that institution at such a height that it can only be adequately viewed from the top of an omnibus. As the bust is by Alfred Gilbert, and few works by that famous sculptor are easily accessible to the general public, this is a pity. To remove the bust from the Hospital to St. Paul's or Westminster Abbey, as has been proposed, would, we think, be equally lamentable. Hunter's memorial should not be removed from the hospital with which his life-work was largely identified, but a fitting position might be found where it could be more easily viewed. Eros, separated from his fountain, stands in the Victoria Embankment Gardens. When, in the fulness of time, his base is restored to him, and he to his base, the public might then have two works in the London streets to remind them of this genius among modern British sculptors.

The Next President

The Manchester Guardian states that Mr. Walter Tapper, A.R.A., has been nominated by the Council to be the next President of the Royal Institute of British Architects. If no other nomination was received by Monday last, the confirmation of Mr. Tapper's election in succession to Mr. E. Guy Dawber may be expected in due course.

THE ROYAL ACADEMY EXHIBITION

Each year that one visits the Academy Exhibition and ponders over the spectacular array of beautiful drawings in beautiful frames, confined, it is true, to a single room of moderate dimensions, one wonders what is the precise effect of this display of architectural talent. We know, of course, that the achievements in the art of building which are there represented are the result of many causes, social and æsthetic, which have been operating over a number of years. But, it is necessary to ask, is the Academy Exhibition also a cause of architectural movements, or is it merely an effect, a means of registering the progress or otherwise which has been made in

the course of a year. Even if it were nothing more than the latter it will serve a useful purpose if it does, but hold a mirror to our architectural selves and enable us to envisage something of what the twentieth century has in store for us in our towns and villages, it will have a profound influence. We may presently examine how far the Exhibition performs this useful office, but before doing so it may be well to indicate in what manner the Academy Exhibition is not merely an effect, of other causes, but a cause itself, a stimulus to new architectural developments. In estimating the nature of the influence the Academy exerts one is

compelled to acknowledge that no matter how often superior people, æsthetic highbrows and others, may sneer at the Academy, it yet retains a very high social prestige, and what is more important still, its roots are well nourished in a rich manure of commercial earth. It is well known that there are many prosperous men of commerce and others sufficiently affluent to wish to celebrate their achievements architecturally who would not dream of asking anybody less than an Academician to design their buildings. It sounds well, and the client, especially if he is not very certain of his own judgment, feels that he has made a safe choice and that his architect, even if he does not produce a work of genius, will at least not

do anything wild or silly. Many of these men of commerce and other prospective architectural clients of similar mentality visit the Academy Exhibition in the hope of having their minds made up for them. If the work of particular architects is very prominently displayed, there is no doubt whatsoever that this fact will be to their personal advantage, and the designs in question will breed other designs like them, which will in fact be executed. In this respect, then, the Academy is itself an architectural cause, it is not just a static record of events, but whether for good or for evil, it has a dynamic influence on the future of architecture. That alone is the justification for our giving prolonged attention to it. The Academy

Exhibition is both an æsthetic and a commercial phenomenon which many people may laugh at, but which should on no account be ignored. To use a phrase of vulgar parlance, the Academy "cuts ice." Whether the ice it cuts is the best ice, or whether it cuts it in the most graceful and efficient manner is, of course, another question.

What are the general impressions which one derives from an examination of the exhibits? The first thing which strikes one is, of course, the marked increase in the scale of buildings. The average height of the new buildings is twenty or thirty feet higher than what was prevalent a hundred years ago. This factor has alone introduced new problems of design with which modern architects are manfully wrestling. Although in England we have not yet been compelled to devote our attention to the design of skyscrapers, as this term is understood in America, it must nevertheless be borne in mind that façades even eighty feet high present very different problems of fenestration to those which our eighteenth century forefathers, in their elegant low buildings, solved with such perfection of architectural skill. That is the first impression—the increased height of the buildings. Next,

one cannot help noticing that, in spite of the vastly increased costs of building, architecture is entering upon a period of opulence and display far removed from that spirit of puritan restraint which a certain number of short-sighted post-war prophets predicted for it. We have now reached a stage at which many commercial undertakings are so great, and involve the handling of such immense sums of money, that the cost of even the sumptuous building represents but a small fraction of their yearly financial outlay. In some of the modern picture theatres, for instance, the problem seems to have been not how to economise in the expenditure, but how to lavish the maximum amount in materials, fittings, and adornment of the building. The great banks also well illustrate this tendency towards architectural opulence, while the great retail dealers are not slow to follow their example.

As the fashionable styles of the day are fully represented in the work of the Academicians, it may be well to examine this first, and then we may compare with the exhibits sent by these latter the designs of the less fortunate practitioners who, while enjoying the hospitality of the Academy, are not yet members

of that body. The elegant plaster model of the Midland Bank, Cheapside, designed by Sir Edwin Lutyens, may claim first mention. This is an interesting building in the English Renaissance manner. The parts of the structure are well articulated; the arcaded basement is surmounted by a mezzanine of rectangular windows with heavy key-stones. Above are three more rows of windows in columns, enclosed in arched reveals. From the main façade the attic recedes, except at the centre, where its pedimented portico appears to commune with the entrance portico across

an intervening expanse of wallage which somewhat unfortunately ignores both these features. A small dome with flagstaff crowns the composition. We may contrast with this Lloyds' Head Office in Lombard Street, by Sir John Burnet and Partners. This also is in the Classic manner. The lower portion of the building, comprising arcade with mezzanine, has a vertical dimension almost equal to that of the colonnade above, with the result that the balustrade and heavy string course separating these two members appears to cut the façade in two, and thus compromise

its unity, but the building is elegantly detailed and well expresses its function. Another great commercial structure is the Head Office of the Cotton Head Office at Manchester, by Mr. Harry Fairhurst. This design seems to have been influenced by Selfridge's, and, like the latter, is marked by an imposing row of columns, which perhaps unduly overbears the neigh-

bouring buildings. It illustrates, however, the dominance which the Classic style, pure and undefiled, still exercises over modern architects. If they want to make their buildings especially expressive they resort to great columns, and invariably succeed in their object. For, quite apart from its social fitness to any particular architectural occasion, there can be

no doubt that the columnar form perfected by the Greeks is exceedingly impressive, and no development in design is likely to render it completely out of date.

A building of a very different type is the new head office for the London Electric Railways in Broadway, by Messrs. Adams, Holden & Pearson. Here a more modern note is struck. Advantage is taken of the building regulations to raise the rear portion of the structure to a great height, and the resultant tower form is an attractive one. The plan is cleverly arranged to enable the three wings, set diagonally with the street, to obtain the maximum of light and ventilation. In more traditional style is the new façade of the Army and Navy Stores, by Sir Aston Webb & Son. In this case the ground floor storey

PROPOSED CATHOLIC CHURCH, ASHFORD, MIDDLESEX.
SIR GILES GILBERT SCOTT, R.A., Architect.

was the first part of the façade to be reconstructed, and the handsome colonnade will now be surmounted by an intermediate storey and a row of round-headed apertures which, while giving the impression of belonging to a single storey of very lofty apartments, are really divided by a floor. This is an instance of the modern tendency to group windows for formal effect alone, irrespective of that expression of the actual arrangement of storeys within the building.

Another impressive public building is that of Leeds University, by Messrs. Lanchester, Lucas & Lodge, of which the main entrance and tower are here shown. This design, which was placed first in an important competition, is remarkable in that it is the final point

of a very large architectural composition of subtlety and refinement. The group of buildings associated with Leeds University will be one of the finest in the kingdom, and show what grand effects can be obtained by the proper exploitation of classic *motifs*. The new Parliament Buildings, Northern Ireland, by Arnold Thornley, are in a correct style, yet perhaps fail to give an idea of a Parliament House. It may be suggested that a dome would here not have been out of place.

Mr. W. G. Newton's design for the Glasshouse Street elevation of the County Fire Office accords

well with the new front of that building, designed by Sir Reginald Blomfield.

One of the most original essays on street front design is that by Messrs. Colcutt & Hamp, who, in the new St. Katherine Coleman House, have combined in a single façade several interesting *motifs*, interesting in themselves, yet not perhaps harmonious with each other. The long multiple lateral windows, apparently embracing four storeys, suggest an interior apartment of ungainly dimensions, while the columnated portion in the centre has little æsthetic relationship, either with these lateral features or with

the doorway beneath it. In contrast to this the new premise in Fenchurch Street, by Messrs. Campbell Jones, Sons and Smithers, seems pleasant in the monotony of its repetitive design, which would certainly accord far better with its architectural neighbours than the former more flamboyant and assertive building.

The High Voltage Laboratory and the New Physics Laboratory, at Teddington, both by Mr. Frederick A. Llewellyn, are handsome buildings, testifying to the importance of scientific research. The New Gallery Kinema, by Messrs. C. Nicholas and J. E. Dixon Spain, represents a new experiment in the interior decoration of this kind of building. The large yellow panels are highly effective, but the entertaining frieze beneath them, although it is so placed that its pictorial quality can readily be appreciated by those in the auditorium, is perhaps not very intimately related

to the decorative scheme as a whole. It is, however, an interesting adventure, and should prompt other designers of cinemas to explore further the uses and possibilities of the pictorial frieze.

Rhodes House, Oxford, by Sir Herbert Baker, is a fascinating composition, in which a dome, a gable, and a columnated portico are seen in contrast. It would be of interest if the clever drawing by Mr. H. L. G. Pilkington, who is obviously an admirer of Mr. Walcott, had also illustrated the relation between this building and its architectural environment. This formal connection between new and old is well shown in the charming sketch of the Chantry Bridge, Rotherham. Here Sir Reginald Blomfield, R.A., has taken an ancient bridge, retained a few of its Gothic arches, which accorded so well with an old building

KIEFFER & FLEMING, Architects.

adjoining its approaches, and with very great skill has placed a brand new but concrete traffic bridge of broad span, but of such reticent design, that it almost looks as if it had been there from the beginning.

Turning to domestic architecture, we see evidence of the increasing popularity of flats. In Mr. Curtis Green's design for a block at Stratford Place he has tackled the problem of the tall façade and has made a gallant attempt to give interest to a group of 49 windows of approximately equal dimensions. The basement, comprising a mezzanine, is well articulated by rustication and a small stone balustrade. The block of flats by Mr. Louis de Soissons and Mr. G. G. Wornum at Larkhall Estate, Clapham, is more suburban in character. It has pleasant proportions, and the brick balcony is a novel feature. In the Gresham Hotel, Dublin, of which the handsome Georgian exterior was exhibited last year, some delightful detail is shown, and Mr. Robert Atkinson once more shows himself to be a master of interior decoration. Mr. P. D. Hepworth's house at East

LEEDS UNIVERSITY: PRINCIPAL FRONT.
LANCHESTER, LUCAS & LODGE, Architects.

Finchley, with its finely decorative gable contrasted with the long straight ridge of the roof, is an attractive composition.

Mr. Guy Dawber is represented by several designs of great interest. The Lord Wardsworth Agricultural College, at Long Sutton, Hants, is an example of traditional English Renaissance work elegantly detailed. In the Foord Almhouses, Rochester, there is a cunning blend of the formal and the rustic, and the quadrangle, with its fine spaciousness relieved by such a lively skyline, is a fascinating composition. The House at Hawkhurst, also designed by Mr. Guy Dawber, shows once more how completely he has assimilated the local building traditions of this county.

One of the most successful designs here exhibited is Mr. W. Harding Thompson's charming scheme for Enham Village Centre, in which an institute, shops and private houses are grouped around a green. The buildings, though small in scale, are elegantly detailed and accord with each other most harmoniously.

& Maule, is a particularly good example of the way to treat an old farm. Here the reconstruction has been so admirably accomplished that the building has retained its old-world character.

The Francis Willmer McAulay Memorial Home, by Mr. Charles H. James, is an attractive design in which brickwork is treated with great skill.

Schools and colleges comprise an important branch of domestic architecture. An excellent example of modern school planning is the New Wineby House School at Cooden, Bexhill, by Messrs. Kieffer & Fleming, and in this instance the complex modern requirements are satisfied in a building which presents the most charming Georgian façades on all sides. This is a design of great merit, as is also Mr. Cyril Farey's Raffles College, Singapore, which has a delightful simplicity of treatment and seems so well adapted to a tropical climate.

The Junior Combination Room at Trinity College, Cambridge, by Mr. Edward Maufe, is one of the most successful pieces of college architecture of recent years. The façade is admirably proportioned and accords well with its situation. The Friend's College, at Chengtu University, West China, by Mr. Arnold Silcock, represents an interesting attempt to adapt the native style to modern usages.

Of ecclesiastical architecture, Sir Giles Gilbert Scott's proposed Roman Catholic Church at Ashford,

HOUSE AT LIMPSFIELD.
NICHOLLS & HUGHES, Architects.

Middlesex, deserves first mention. This group is an assemblage of simple architectural shapes harmoniously combined, and the general effect is interesting. It may perhaps be suggested, however, that the attic storey of the tower is inadequately joined to the sub-structure. Mr. Walter Tapper's design for a hall at Handcross, Sussex, is an elegant composition. The end elevation is an attractive one, while the three transepts with arched reveals are novel features which are pleasing in their formal simplicity. The design is a notable contribution to modern church architecture, for it shows what interesting effects can be obtained by the use of time-honoured classic *motifs*. The Church of St. Austin's, Wimbledon Park, by Adrian Gilbert Scott, is an impressive interior in which the bare white walls contrast admirably with an array of simple roof trusses. Messrs. H. V. HENRY S. LAWRENCE, Architect.

Queen Street is a clever essay in neo-Grec. The corner site is well utilised, and the great stone cupola will be a notable feature in the Metropolis.

In considering the qualities of church building, it has latterly become necessary to give considerable attention to an important group of new structures, the halls of worship erected by the Christian Scientists, who are gradually evolving an ecclesiastical tradition of their own. The First Church of Christ, Scientist, in Bromley, Kent, by Mr. W. Braxton Sinclair, is an interesting addition to the number of such halls, all of which are without hall or spire and are thus readily distinguishable from the churches belonging to other religious denominations.

The Architectural Room shows an unusually interesting set of exhibits. One obvious criticism occurs to one, namely, that the number of *plans* shown is getting smaller and smaller. Even the practice of placing plans to a small scale at the corners of the pretty water-colour perspective sketches appears to be now dying out. Surely the Selection Committee might be induced to insist upon these miniature plans being presented with the drawings, and thus respect one harmless predilection of architectural visitors to the Academy.

HOUSE AT MARLOW.

THE TILE WITH AN OLD-WORLD CHARM ~ ~ ~ ~

If you are interested in the preservation of old-world charm, you should consider Courtrai-Du Nord Roofing Tiles. Their charm lies in their light Roman Roll and in their simplicity—simplicity of design and simplicity with which they can be laid. May we send you a copy of the Courtrai-du Nord Tile Booklet?

ROOFING TILES

ESSAYS BY THE WAY

II.—Plus-Four Architecture

By "SCRUTATOR."

Probably one of the effects of an intense urbanisation is to set up renewed longings for the countryside, from which we have, perhaps unwillingly, or at least to some extent unnaturally, been divorced. As a race, despite, or perhaps because of, the enormous and rapid growth of our large towns during the last hundred years, we have preferred the country to the town. Our cities have become in a measure "Gehennas" for the making of money, from which we can retire as early as possible to live a sort of quasi-agricultural life; or perhaps only a semi-retirement with a pied-à-terre in Gehenna from Monday to Friday, with the Paradisaical country house as the fitting reward for the week-end.

We are very proud of our domestic architecture, and by "domestic" architecture we usually mean "country house" or "country cottage" architecture, as we aspire to the great or small, and though possibly the suburban might be included under this heading—never the urban.

A few *misguided* people, like Mr. Trystan Edwards, may still believe in large residential cities in the grand manner, which shall enshrine an urban politeness, but are for the most part fully agreed that towns are to be escaped from, or, if escape be impossible, then a garden city or a garden suburb, with its scattered development of one's and two's, is the most that we can tolerate in civic neighbourliness, and even so we feel cramped and long for that *unsophisticated* country where we can live with every degree of modern comfort.

The majority of us, alas! are city dwellers, urban or suburban, with the acquired tastes and artificial habits of the townsman, so that even when we make the *grand escape*, our habits accompany us with the persistency of unpaid bills, clamorously pursuing us in the wistful hope of an early redemption. Even when we have achieved our bucolic Paradise we view the country with an artificial detachment that has something of the theatrical about it. The lights and darks are heightened and intensified, and the country that we actually inhabit is a terra-incognita of exaggerated rusticity. This exaggeration has, I think, been increased since the war, and is reflected both in our clothes and houses. The useful and ubiquitous plus-fours—I refer to the whole suit, and not only to the nether garments—has tended to get more tweedy with larger and ever larger checks, whilst the bagginess of those same nether garments, apeing the sartorial freedom of Hodge, attains to so serious an increase of area as to pleasantly affect the credits of the woollen industry. I have seen many a sheep eyeing with reproachful attention the wild waste of wool betrayed in the clothes of the intruding golfers.

Our country houses, too, show the effects of this urban-Americanised attitude to the ruralities.

There is a certain type of house that has sprung into existence since the war that I always think of as a plus-four house. It has all the qualities of a Kent or Sussex farm or manor house seen in the artificial glare of the footlights. The half-timber of these "plus-four" houses is of a surprising plentitude, the ceilings of the extraordinarily low, wide rooms are beamed with a lavish beamishness, which illuminates the never before quite comprehended saying "My beamish boy." The open fireplaces, on which repose those giant logs supported by cunningly contrived iron-dogs, are fashioned in a curly brick-work, the twistiness of which is a sufficient answer to those pessimists who talk so despondently of the decay

of the peasant crafts, the bricklayers amongst the rest.

Everything is on the same scale of exaggeration—the heavily leaded windows, the waviness of the old-tiled roofs, the artificially treated oak, all bear witness to the desire to escape from the urban, the conventional, the commonplace of everyday life.

It is all a little mad, but quite excusable and of the essence of art, albeit a slightly theatrical art, and I also have had moments when the vision of being whirled away, in the most luxurious of modern cars, to some too-perfect country cottage, there to be regaled with satisfying glimpses of pigs and potatoes whilst sipping a rare and generous cocktail in a stone-flagged hall-sitting-room of a sufficient oakiness. It would be alluring enough to drag me from my Cockney fastness, to try the *Simple Life* from Friday night to Monday morning.

What the exact social significance of these houses is, if any, would be a little difficult to determine. They may be silent witnesses of the end of that ampler country house life which is now on the wane, and in the not very distant future may be quite extinct, or they may be the forerunners of that super-suburbanisation which, following the track of the motor car, is gradually spreading, like a creeping paralysis, over the whole face of the country.

But, if they are of the advance guard, they observe an immense difference, and, as opposed to the cheap and makeshift, are excessively expensive. They are so obviously and emphatically hand-made: there is not the least little suggestion of a machine anywhere, for that would be to betray their architects unforgivably. They have all the distinction that a pair of hand-made shoes has amongst a multitude wearing nothing but factory-made footgear. In fact, it may be that in the years to come they will be as almost unique as the expensively rare possessions of the very rich. It is surprising how exceedingly costly it is for rich folk to become simple.

Hunting, which is the craft of the poorest of mankind—such as the almost extinct Red Indians of North America—has become the pastime of the very wealthy.

History reminds us of the extreme costliness of the "simple" life led by Marie Antoinette and her Court, when they played at being shepherds and milkmaids at that pretty little artificial village near the smaller of the Trianons. To be an amateur farmer is to indulge in a hobby which requires the purse of a millionaire, and one, moreover, who reckons his millions in pounds sterling and not in dollars! So it would seem that to be able to live in the country at all to-day one must be very poor or very rich!

In my poetic moments I have often felt how delightful it would be to live in the country, in such a house as I have described, with all the appropriate appurtenances. One would, of course, be dressed in nothing but homespuns. Your food would be home-grown, with the purest butter, milk and cream supplied daily from your own little model dairy. Only, I think if I could afford all this, I should decide to live in Town.

Architects' Registration Bill

The Select Committee has been appointed, and will consist of the following members: Sir Clement Kinloch-Cooke, Colonel Moore, Dr. Watts, Captain Wallace, Sir Alfred Hopkinson, Major Tasker, Sir Frederick Rice, Sir Murdoch Macdonald, Mr. Gardner, Mr. Viant, and Mr. Lindley.

The Hall Mark of Your Craftsmanship

IN our preceding announcements we indicated how Craftsmanship in the Electrical Industry is reflective; that the accessories used, for example, in an installation reflect the standard of Craftsmanship of those who fit them.

The standard of work is thus judged by the user in subsequent service—particularly in the Switches, the only moving parts of the installation. If the wiring is ever so good—a neatness in workmanship and a high standard of Electrical Craftsmanship in other respects attained—yet it is the efficiency, the durability of these “moving parts” that sets the seal of excellence on the complete installation.

Hitherto—we have striven to show the supreme honesty of purpose that lies behind the “Crabtree” Switch—the patient research—the drastic tests—backed by an all-pervading quality that has won it universal appreciation. Now we would emphasise how that same lofty standard is maintained in all the “Products of Craftsmen”—how the name “Crabtree” is a sure guarantee of sincerity in all things.

A SUGGESTION

MAY we suggest that before purchasing Fireplace Suites or Sanitary Appliances you and your Clients should visit our recently re-arranged Showrooms at 17 & 18 Upper Thames Street, London, E.C.4.

The range of Fireplace Suites offered for inspection is a very wide one. A special feature is the number of beautiful Period Designs, many of which we owe to our own craftsmen of a century ago.

The Register Grate illustrated is in Armour Bright finish and fitted with the Hot Hearth Fire. It is particularly suitable for office or country house use.

Professional Societies

The Royal Institute of British Architects

We take the following notes from the minutes of the Council, held on April 11:

VISIT OF DANISH ARCHITECTS.—Permission for the use of the galleries was granted to the Architectural Association for the dance to be held on May 27 in honour of the Danish architects visiting England. It was also decided to invite the Danish architects to meet the President and Council at the Exhibition of Modern British Architecture.

LIST OF EXAMINATIONS RECOGNISED FOR THE PROBATIONERSHIP.—It was decided to make history and geography alternative subjects in the list of subjects required to be covered by the certificates recognised for the probationership.

THE SCHOOL OF ARCHITECTURE, LEICESTER COLLEGE OF ARTS AND CRAFTS.—Recognition for exemption from the R.I.B.A. intermediate examination under the usual conditions was granted to this school for its three years' full-time day course.

THE VICTORY SCHOLARSHIP, 1926-27 COMPETITION.—It was decided to grant a certificate of honourable mention to the author of the drawings submitted under the motto "Sea."

THE ARTHUR CATES PRIZE.—It was decided to approve the proposal of the Charity Commissioners that the amended scheme for the Arthur Cates prize should provide for the offer of an annual prize for the promotion of the study of architecture, more especially in relation to the application of geometry to vaulting, etc. (*i.e.*, the object especially indicated by the founder), with a proviso that if in any year (either owing to absence of competitors or the fact that no work of sufficient merit is submitted) no prize is awarded, then the following year the prize shall be offered in connection with some other architectural subject, *e.g.*, town planning. The scheme would further provide that the income of the charity unexpended in any year should be added to the capital endowment, so that the value of the annual prize might ultimately be augmented.

THE R.I.B.A. (HENRY SAXON SNELL) PRIZE.—It was decided to amalgamate the R.I.B.A. (Henry Saxon Snell) prize with that offered by the Architectural Association, and to institute a Henry Saxon Snell scholarship, to be offered every third year, and administered by a Joint Committee of the R.I.B.A. and the Architectural Association, the income of the two funds being amalgamated for the purpose of providing the scholarship fund. The Council of the Architectural Association have agreed to this proposal.

THE VICTORY SCHOLARSHIP MEDAL.—It was decided to institute a medal, to be awarded with the Victory scholarship, in commemoration of members of the Society of Architects who fell in the war. A selection of esquisse designs for the medal has been obtained from the Recognised Schools of Architecture, and that prepared by Mr. E. B. O'Rorke, of the Architectural Association School of Architecture, has been selected as most suitable.

LECTURES ON ARCHITECTURE FOR WORKERS IN THE BUILDING TRADES.—The Board reported that in accordance with the suggestion approved by the Council on April 19, 1926, they have held two series of lectures on architecture for workers in the building trades. The subjects and lecturers were as follows: "The Job," by Mr. L. Sylvester Sullivan; "Materials and Craftsmanship," by Professor H. Worthington; "Good and Bad Buildings," by Mr. Howard Robertson; "The Wealth of England," by Mr. W. G. Newton; "The Palace of Westminster," by Mr. T. Wilson (Superintendent of Works, H.M. Office of Works); "Surface Treatment of Concrete and Cast

Stone," by Mr. H. A. Holt, A.I.Struct.E.; "Liverpool Cathedral," by Professor C. H. Reilly; "General Materials," by Mr. H. Jarman (Superintendent of Works, H.M. Office of Works). The lectures were increasingly well attended by representatives of most of the building trades. During the discussions the following points were brought out: (1) That more interest would be taken by the craftsmen in the buildings upon which they were engaged if models of the proposed buildings were placed upon the works for their inspection while the buildings were in progress and that complete plans and drawings might be available in order that the men could see how the work they were doing fitted into the whole structure; (2) that craftsmen should be given more liberty to use their discretion in the execution of their particular crafts; (3) that the architect and craftsman should get into closer personal touch with each other; (4) that architects might take building apprentices over their works while in progress and at completion. It was decided to approve the recommendation of the Board that steps should be taken to bring the above desires to the notice of all practising architects.

Sheffield Society of Architects

The annual meeting of the Sheffield Society of Architects and Surveyors was held recently at the University. The report presented by the hon. secretary (Mr. H. B. S. Gibbs) showed an increased membership, which is now 92 as against 71 last year. Special reference was made to the Architectural Department at the University (under the control of Mr. St. John Harrison). The election of officers for 1927-28 resulted as follows: President, Mr. F. E. Pearce Edwards; vice-president, Mr. C. N. Hadfield; hon. treasurer, Mr. J. R. Wigfull; hon. secretary, Mr. H. B. S. Gibbs. The Council members are Messrs. E. M. Gibbs, W. C. Fenton, W. J. Hale, A. F. Watson, and C. B. Flockton. Fellows of the Society: Messrs. W. G. Birch, J. M. Jenkinson, J. A. Teaker, J. C. P. Toothill, H. I. Potter, and E. M. Holmes. Messrs. F. H. Wrench, J. H. Odom, and J. Lancashire were elected associate members.

The Architectural Association of Ireland

The Architectural Association of Ireland, at a recent meeting at 8 Merrion Square, Dublin, had before it the report for the session 1926-1927, which stated that the record of the year's work was very satisfactory, and that 21 new members had been elected during the session, making a total of 155. The Downes Bronze Medal was awarded to Captain Henderson, and the Architectural Association Prize to Mr. T. Carberry. Mr. Sedgwick Keatinge, in the course of his valedictory address, said that there was one thing that he would like to say to those architects who had pupils in their offices who were attending the studio and the lectures at the National University, and that was that this system of training students was the best method by far that the Architectural Association had taken up. However, to be a success the students must attend at the University regularly, and he asked the members to make it possible for their apprentices to leave their offices at the hours laid down in the programme, not only for the good of the student, but for the good of the Architectural Association.

Scottish Architects

The monthly meeting of the Council of the Incorporation of Architects in Scotland was held recently at 15 Rutland Square, Edinburgh, Mr. G. P. K. Young, F.R.I.B.A., president, in the chair. Approval was given to the programme drawn up for the annual convention, which is to be held at Elgin on June 3 and 4.

SOME TRADITIONS OF
THE PLASTERER'S CRAFT

*Drawn by D. M. Cafferata.
Historical data by George Bankart.*

F. PRIMATICCIO of Bologna, a worker with Guilio Romano, being received by Francis 1st, of France in 1531 and commissioned to decorate Fontainbleau with stucco. This young artist's work is upon many notable French buildings and it influenced English work.

The enduring qualities of early stucco mixtures depended upon the technique of the individual worker and the laborious preparation of the material. Time is saved, and permanence of the finished work is assured when stucco is made with Portland cement waterproofed with

London Building Notes

BECONTREE.—A block of shops and business premises is to be erected on the L.C.C. housing estate, the site being in Halbutt Street. Mr. Edward Meredith, A.R.I.B.A., architect, 7 Goodmayes Road, Goodmayes.

BLOOMSBURY.—The Co-operative Permanent Building Society, Ltd., Red Lion Square, W.C.1, propose to erect a block of offices in Hart Street, W.C. Mr. P. Morney, architect, 22 Red Lion Square, W.C. The builders are Messrs. Thomas & Edge, Station Chambers, Cross Street, Woolwich, S.E.18.

BROMLEY ROAD.—A row of 20 shops is to be erected upon a site in Bromley Road, Lewisham, S.E. The building work will be carried out by the owner, Mr. Jas. Watt, builder, 1 Central Parade, Bromley Road, S.E.6.

CITY.—A rebuilding scheme is projected at St. Bartholomew's Hospital, E.C.1, by the Governors, at a cost of £200,000. Messrs. Lanchester, Lucas & Lodge, F.R.I.B.A., architects, 19 Bedford Square, W.C.1.

CLERKENWELL.—A cinema theatre is to be erected on a site in Rosebery Avenue, E.C.1, opposite Sadlers' Wells Theatre. Mr. Cecil Masey, L.R.I.B.A., architect, 19 Devereux Court, Strand, W.C.2.

ELTHAM.—Plans are in course of preparation for the proposed new elementary school to be built in Galdham Square, Eltham. The cost of the building and its equipment is estimated at £37,000. Mr. G. Topham Forrest, F.R.I.B.A., architect.

FINSBURY.—A large building, to provide shop, office and warehouse accommodation, is to be erected at the junction of City Road and Featherstone Street, E.C.2. Mr. William A. Lewis, A.R.I.B.A., architect, 11-12 Finsbury Square, E.C.2.

FULHAM.—New tenement flats are being erected on a site in Lister Terrace, Fulham, S.W., by the Trustees of the Samuel Lewis Trust for Dwellings for the Very Poor. Messrs. Joseph, architects, 2 Pauls Bakehouse Court, Godliman Street, E.C.4. The contractors are Messrs. Higgs & Hill, Ltd., Crown Works, South Lambeth Road, S.W.

GREAT WEST ROAD.—The building of a large number of houses is contemplated on a site on the new Great West Road, S.W. Preliminary operations on the estate are under the direction of Messrs. P. Chase Gadner & Co., surveyors, High Street, Hounslow.

ISLINGTON.—Building operations have commenced at the premises at 159-169 Upper Street, Islington, N.1, where the London Co-operative Society, Ltd., possess a large loading depot. Messrs. North, Robin & Wilsdon, A. & F.R.I.B.A., architects, 35-39, Maddox Street, W.1. The builders are Messrs. Nox, Ltd., 44 Praed Street, W.2.

KING'S PARK.—Alterations are to be effected at the premises known as St. Leonard's House in King's Park, E.2, for the Governing Committee. Mr. F. Danby Smith, F.R.I.B.A., architect, Parliament Mansions, Victoria Street, Westminster, S.W.1.

LEWISHAM.—The senior departments of the Dalmain Road School, at Lewisham, S.E., are to be rebuilt, at a total cost of £25,000. The builders are Messrs. W. H. Gaze & Co., Ltd., 23 High Street, Kingston-on-Thames. Mr. G. Topham Forrest, F.R.I.B.A., architect.

LEWISHAM.—The premises in Lewisham High Street, S.E., of Messrs. Strouds, Ltd., drapers, etc., are, it is understood, to be reconstructed. The present proprietors are the Royal Arsenal Co-operative Society, Ltd., of Woolwich, S.E.18.

MARYLEBONE.—Mr. S. Berney, the owner of the Prince of Wales Picture Theatre in Harrow Road, W.2, intends to completely rebuild the cinema. The expenditure involved is stated to be approximately £100,000.

MITCHAM.—A fire station is about to be built at Mitcham on a site secured some time ago by the U.D.C. Messrs. Chat, Son & Reading, architects, High Street, Croydon. The contractors are Messrs. J. Saunders & Sons, 54 London Road, Croydon.

PLUMSTEAD.—The "Empire" Theatre, N., is to be enlarged. Mr. Cecil Masey, L.R.I.B.A., architect, 19 Devereux Court, Strand, W.C.2.

SHIRLEY.—The Governors of the Bethlem Royal Hospital are to erect new buildings on the Monks' Orchard estate, near Croydon. The scheme will probably cost about £250,000.

SOUTH AUDLEY STREET.—No. 8 South Audley Street, W.1, known as Alington House, is to be utilised as business premises, involving considerable structural alterations. The freeholder of the property, Sir B. G. D. Sheffield, Bart., M.P., is applying for authority to carry out the scheme.

SOUTHWOOD LANE.—The Furnishing Trades Benevolent Association propose to carry out a scheme of enlargement at the association's rest homes, known as Radlett House, in Southwood Lane, N.6. Mr. S. Clifford Tee, F.R.I.B.A., architect, 50 Moorgate, E.C.2.

STRATFORD.—A picture theatre and restaurant, to be called "The Stratford," are to be erected in Tramways Avenue, Stratford, E.15. The new building is estimated to cost over £100,000. The architect is Mr. George Coles, F.R.I.B.A., 40 Craven Street, Strand, W.C.2. The builders will be Messrs. Thomas & Edge, Cross Street, Woolwich, S.E.18.

TOWER BRIDGE ROAD.—A picture theatre is to be built on a site in Tower Bridge Road, S.E., by the Tolmers Square Cinema Co. Messrs. Lovegrove & Papworth, architects, 374 Old Street, Finsbury, E.C.2.

VICTORIA STREET.—The Army and Navy Co-operative Society, Ltd., propose the reorganisation and modernisation of the existing showrooms and the rearrangement of the lifts. Sir Aston Webb and Mr. Maurice Webb, F.R.I.B.A., architects, Queen Anne's Gate, Westminster, S.W.1.

WADDON.—A new school, designed by Mr. A. Sunderland, L.R.I.B.A., Sydenham Road, Croydon, is to be erected.

WESTMINSTER.—The area covered by Nos. 8-12, New Cavendish Street, and 29-51 Hallam Street, W.1, is to be developed by the erection of a block of residential flats, with shops on part of the ground floor frontage. Mr. V. Huxley, F.R.I.B.A., architect, 10 Great Russell Street, W.C.1.

WESTMINSTER.—The licensed premises in Warwick Street, Pimlico, S.W.1, known as "The Duke of Clarence," are to be pulled down and a new public-house erected on the same site. Messrs. William Bradford & Sons, architects, 12 Regent Street, W.1. The builders are Messrs. Douglas Halse & Co., Ltd., Green's End, Woolwich, S.E.18.

WESTMINSTER.—New shops and offices are to be erected upon a site in Rochester Row, S.W.1, upon which was formerly the old Military Hospital of the Brigade of Guards. The builders are Messrs. Robertson, Ltd., 21 Knightsbridge, S.W.

WESTMINSTER.—Work is in progress upon the site in Orange Street, S.W.1, of the new library for the Westminster City Council, which is expected to cost £50,000. The builders are Messrs. Walden & Co., Ltd., Swallowfield Reading, and the steelwork is being erected by Messrs. Dorman Long & Co., Ltd., Middlesbrough. The stone facade is being supplied by the Bath and Portland Stone Firms, Ltd., Bath, to the direction of the architect, Mr. A. N. Prentice, F.R.I.B.A., 10 Norfolk Street, Strand, W.C.2.

WINTERBOURNE ROAD.—The Croydon E.C. propose to erect a new central school in Winterbourne Road. Plans are being prepared by Mr. William H. Ashford, A.R.I.B.A., 3 Paradise Street, Birmingham.

WOOLWICH.—A new operating theatre is to be erected at the Greenwich and Deptford Hospital in Woolwich Road, S.E., for the Greenwich B.G. Quantities have been prepared by Mr. Louis Jacob, F.S.I., 58 Garden Square, W.C.1.

Manchester College of Technology

The Governing Body offers a limited number of research scholarships in technology. The value of the scholarship will not exceed £100. These will be tenable during the session 1927-28 in the College. Research may be undertaken in any of the following departments: Mechanical engineering; electrical engineering; municipal and sanitary engineering; applied chemistry: (a) general chemical technology, (b) chemistry of textile (bleaching, dyeing, printing, and finishing), (c) dyestuffs, (d) fuels, (e) paper manufacture, (f) metallurgy and assaying, (g) chemical technology of brewing, (h) electro chemistry; textile industries; photographic technology; printing; industrial administration. Applications (which must be made on prescribed forms to be obtained from the Registrar of the College of Technology, Manchester) must be received on or before July 6, 1927.

EARLE'S CEMENT

FOR EARLY HARDENING

The Week's Building News

The following abbreviations are used: U.D.C. for Urban District Council; T.C. for Town Council; R.D.C. for Rural District Council; E.C. for Education Committee; B.G. for Board of Guardians; P.C. for Parish Council; B.C. for Borough Council; M.H. for Ministry of Health; M.T. for Ministry of Transport; C.B. for County Borough; B.E. for Board of Education. Direct confirmation should be obtained before commitments, for which we cannot be responsible, are made.

BARNSELY.—An hotel is to be built in Huddersfield Road by John Smith's Tadcaster Brewery Co., Ltd., at a cost of £7,000. Mr. B. Wilson, architect, High Street, Tadcaster.

BERMONDSEY.—The B.C. propose building 17 new-type bungalows of brick construction, at a cost of £310 each.

BILSTON.—The E.C. recently appointed Messrs. Joynson Bros. as architects for the proposed new school at Loxdale Street.

BIRMINGHAM.—Messrs. Essex & Goodman, architects, 21 Waterloo Street, Birmingham, are to erect a number of shops on a corner site at Monument Road and Plough and Harrow Road.

BIRMINGHAM.—The new branch public library at Ward End will be erected by Messrs. W. & J. Webb, 256 Great King Street, Birmingham, the contract price being £12,323.

CARMARTHEN.—The Borough Surveyor, Mr. G. L. Evans, has been appointed architect for the housing scheme.

CHESTERFIELD.—Mr. W. A. Darbyshire, of Slumangate, Chesterfield, is preparing plans for the new Primitive Methodist Church to be erected at Stonegravels, near Chesterfield.

CHURCH.—New club premises are to be erected in Market Street, near Acerington. The plans have been prepared by Messrs. Pollard & Pollard, architects, County Bank Chambers, Padiham, near Burnley. The contract has been let to Mr. D. Grimshaw, builder and contractor, 177 Dill Hall Lane, Acerington, Lancs.

CITY OF LONDON.—Messrs. Stone & Drew are to erect a building at 49-52 Houndsditch.

COALVILLE.—The Coalville Working Men's Co-operative Society, Ltd., Coalville, Leics., propose to build a central factory and warehouse. The cost is estimated at £30,000. Mr. Harry Swanwick, architect, 10a High Street, Coalville.

DONCASTER.—A new hotel is to be erected at the junction of Barnby Dun and Thorne Roads, Doncaster. Plans prepared by Messrs. Wilburn & Atkinson, Exchange Buildings, Market Street, Doncaster.

DURHAM.—Plans have been approved for the erection of a new Miners' Hall and Institute at Fishburn Colliery. The architect is Mr. W. A. Kellett, Lloyds' Bank Chambers, Barnard Castle, Durham.

EASTBOURNE.—The Corporation have asked the Borough Engineer to submit plans for non-parlour houses, to be erected on the remaining portions of the Victoria Drive estate, and also for roads and sewer works.

GARSTANG.—Mr. Luke Parkinson, of Lancaster, is proposing to carry out structural alterations to the "New Holly" Inn, Garstang. The plans have been prepared by Mr. R. W. Jackson, L.R.I.B.A., of 43 Church Street, Lancaster.

GATESHEAD.—For new stores, offices, etc., for Messrs. Brett's Oil and Grease Co., Gateshead, Mr. W. Hall, Derwent Joinery Works, Gateshead. The architect is Mr. J. N. Fatkin, 77 Westgate Road, Newcastle-on-Tyne.

GOODMAYES E.—The Trustees of the Congregational Church have signed a contract with Messrs. H. Knight & Sons, 16 Bruce Grove, Tottenham, N., for a new church, costing £8,557, to be erected from the designs of Messrs. George Baines & Son, F.F.R.I.B.A., A.I.Struct.E., architects, 121 Victoria Street, S.W.1.

LEEDS.—An expenditure of £40,000 is projected by the committee of the Leeds Maternity Hospital upon a complete reconstruction and extension of the institution. The plans have been prepared by Mr. George Atkinson, 1 Mark Lane, Leeds.

LEEDS.—Messrs. Thomas Winn & Sons, architects, are to rebuild the "Yew Tree" Inn, Ellerby Lane.

LEEDS.—Messrs. Thomas Winn & Sons, architects, have prepared plans for the rebuilding of the "Old Hall" Inn, at the junction of Kelsall Street and Wade Lane, Leeds.

LEEDS.—Plans have been prepared for additions to the "Trebba" factory of Messrs. May & Sons. The architects are Messrs. S. Frederick Bowman & Son, Park Row, Leeds.

LEICESTER.—Building is to commence upon the site of the new central stores and restaurant to be erected for Messrs. Boots, Cash Chemists, Ltd., of Nottingham. Messrs. Bromley & Watkins, architects, Prudential Chambers, Nottingham.

LEVENSHULME.—Messrs. T. Seymour Mead & Co., Ltd., Cambridge Street, Hulme, Manchester, propose to build a new store premises and a clubroom on a site at Burnage Lane, Burnage, Manchester. The plans have been prepared by the firm's resident architect, Mr. A. G. Balis. The contract has been secured by Messrs. Alfred Hodgkinson, Ltd., builders and contractors, 62 Greenhill Street, Greenheys, Manchester.

LEYLAND.—A new Manse is to be erected in Balcarres Road. The plans have been prepared by Messrs. John Tomlinson, Ltd., architects, Townsgate Sawmills, Leyland, who are also carrying out the work.

LIVERPOOL.—Mr. W. Ellis, of 9 Hardshaw Street, St. Helen's, has worked out a design for the new church proposed to be erected at Broad Green.

LONDON.—Messrs. J. Lyons & Co., Ltd., are proceeding immediately with the erection of another large restaurant in London. This is to be erected on the site of the old Oxford Theatre of Varieties. Mr. F. J. Wills, F.R.I.B.A., is the architect. The contract for the faience for the main façades, amounting to more than £10,000, has been placed with the Leeds Fireclay Co., Ltd.

MANCHESTER.—Mr. J. McMoran, builder, 54 Burnage Hall Road, Burnage, Manchester, has acquired a site off Kingsway, Levenshulme, which will be known as the Hurstfold Avenue Estate, where he proposes to erect 30 houses. The plans have been prepared under his supervision.

NEWCASTLE-ON-TYNE.—An expenditure of about £40,000 in involved in connection with the proposed rebuilding of the Westgate Picture House. Messrs. Percy L. Browne & Son, architects, Pearl Building, Northumberland Street, Newcastle-on-Tyne.

NEWCASTLE.—The contract for new warehouses in Newcastle for Messrs. Woride & Co. has been placed with Mr. W. Hall, Derwent Joinery Works, Gateshead. Plans prepared by Messrs. Cackett & Burns Dick, Pilgrim House, Newcastle-on-Tyne. The contract for the erection of a warehouse for Mr. Nausembaum has been placed with Messrs. John Jackson & Sons, Corporation Street, Newcastle. Mr. J. Walton Taylor, St. John Street, Newcastle-on-Tyne, prepared the plans.

NEWPORT.—Plans for the institute which is to be a permanent memorial to Mr. W. R. Lysaght, C.B.E., chairman of Messrs. John Lysaght Orb Works, Newport, were recently passed. The architects are Messrs. Johnson & Richards. The cost is estimated at £20,000.

NORTHWICH.—Messrs. Brunner Mond & Co., Ltd., of Northwich, are carrying out a housing scheme for their employees. The whole of the scheme consists of 204 semi-detached houses and 29 bungalows, the whole of the bungalows and 154 houses being erected on the Hartford Hill estate, and the remaining 50 houses on the Old Golf Links site, Winnington. The contractors are as follows: Hartford Hill, Swinton, Manchester, 114 houses, Messrs. J. Gerrard & Sons; Messrs. F. Warburton & Son, Stockton Heath, 24 houses; Mr. F. Whitehead, of Hayhurst Street, Northwich, 16 houses; Mr. F. Whitehead, of Hayhurst Street, Northwich, 29 bungalows; Mr. W. E. Noden, of Grange Lane, Winsford, 50 houses.

NOTTINGHAM.—The Senate of Nottingham University propose to erect a women's hostel, to be erected out of funds provided by Sir Jesse Boot. The building is estimated to cost £30,000. The University architect is Mr. P. Morley Horder, F.R.I.B.A., 5 Arlington Street, S.W.1.

NUNEATON.—The T.C. were recently informed that the M.H. had sanctioned the borrowing of £8,674 for the purchase of land between Central Avenue and St. Mary's Road for the purposes of housing. The architect had submitted a suggested scheme and layout plan for the erection of 80 houses on this estate. The Housing Committee recommended that the scheme be approved, and that the architect prepare plans, etc., for the next meeting of the committee.

HY-RIB

The Combined Reinforcement and Centering

HY-RIB IS THE PERFECT BASE FOR PLASTER AND CONCRETE.

Note the design of the mesh as a key for cement plaster.

The general advantages of Hy-Rib as a combined reinforcement and centering have been generally accepted. This material, manufactured from the best British steel at our works at Trafford Park, Manchester, has been sold in increasing quantities for the past twenty years until the present time, when it is used at the rate of thousands of square yards per day.

USE HY-RIB AND ELIMINATE CLOSE-BOARDED SHUTTERING.

A TYPICAL HY-RIB CONCRETE GARAGE.

HY-RIB CONCRETE GARAGES.

The Hy-Rib garage is ideal for those desiring a substantial fire-proof building. The example here shown has a steel framework to which the Hy-Rib is attached and plastered.

Any type, design or size of garage can be economically built with Hy-Rib construction.

HY-RIB CONSTRUCTION
IS VERY SPEEDY.

The 1927 Hy-Rib Handbook, containing detailed information, will be forwarded on application.

THE TRUSSED CONCRETE STEEL CO. LTD.

REINFORCED CONCRETE ENGINEERS

22 Cranley Gardens, South Kensington, S.W.7

ROWLEY REGIS.—A lay-out plan for the Twidale Hall estate has been prepared by Mr. Stanley A. Griffiths, architect.

Trade Note

Mr. James Stevens has been appointed a director of The Cement Marketing Co., Ltd.

In Harmony

with its surroundings the building of English Facing Brick with its Roof of Hand Made Tiles will stand for centuries as a worthy example of the character of our time. Improved by age and weather and free from upkeep expenses such buildings give a service far more complete than if other materials are used externally.

Architects and Builders should ensure that they give their clients that complete service and satisfaction by selecting Facing Bricks and Roofing Tiles at the show-rooms of

VULCANITE.

on a VULCANITE ROOF!

No need to fear rain dripping through a roof covered with a material that will stand that strain!

Vulcanite Roofing is absolutely water-tight and weatherproof. It is Fireproof, too, when covered with sand and gravel or $\frac{1}{2}$ inch of tar macadam. Low in first cost, its long life makes it not only the best but the cheapest roofing on the market.

Roofs covered with Vulcanite are safe for ever. That is why Vulcanite has been used during the past 30 years by Builders who want the best and by Architects who study their clients' expenditure as well as their own reputation.

VULCANITE FLAT ROOFING

Used under the London Building Act and the Bye-Laws, etc., of all Borough and Urban District Councils. Accepted by all the Leading Fire Insurance Companies as an Insurance Tariff Roof.

WIN THE FIGHT AGAINST DAMP BY USING VULCANITE DAMPCOURSES

Easily Laid—will not squeeze out, fracture or rot.
We make a variety of Damp Courses for all types
of Building.

NOBLESSE OBLIGE

Architects have a dual function to perform; in their capacity as practitioners they are creators of the buildings of to-day, but it is also incumbent upon them to be in a special sense the guardians of such architectural beauties as have been bequeathed to us from the past. As practitioners they quite properly expect payment for their services on a commercial basis, but such action as they choose to take in defence of ancient buildings threatened with destruction are voluntary, and although honourable to them as citizens are not attended with pecuniary rewards. Every architect worthy of the name must spend part of his energies in fighting the general battle of architecture, which does not merely consist in designing good buildings for present use but is also concerned with the preservation of masterpieces of civic art, which still serve, or can be made to serve, a useful social purpose. Propaganda, the giving of free advice on professional matters, arduous attendance on committees, all occupy some part of the energies of a public-spirited architect. Does the prestige of the profession demand yet another sacrifice on the part of its members; are they to be called upon to prove their disinterestedness by a still further expenditure of time upon unremunerative pursuits? An occasion for such additional service appears to be provided by an important Act of Parliament recently passed which provides for the reconditioning of old cottages in rural areas.

The Housing (Rural Workers) Act of 1926 aims at securing a contribution to the improvement of housing conditions for agricultural labourers and other country workers, by restoring old houses in such a way as to bring them up to modern standards of comfort and sanitation, and by the conversion into dwellings of buildings not previously used for that purpose. As is well known, the Act provides for assistance both by grants (towards which Exchequer contributions will be available) and by loans to be made available by Local Authorities to owners who are willing to undertake the carrying out of approved works. The Act attaches conditions to the grant of public money which are designed to secure that the benefits shall go practically entirely to the tenants and not to the landlords, and it directs

attention to the necessity for preserving any historic architectural or artistic interests in buildings dealt with under its provisions, and to the importance of securing that the dwellings when completed will be in all respects satisfactory.

How can these conditions be fulfilled unless architects can be induced to collaborate wholeheartedly in the undertaking? Yet the unpleasant truth must be confessed that, except in those comparatively few instances where the owner has not only architectural taste but also the requisite pecuniary means, professional advice will not be sought or paid for; and the reconditioning of the cottages will be the work of men who will be actuated solely by motives of economy and because, ignorant of our great traditions of cottage buildings, will have no reverence for the ancient structures they are called upon to restore. It is obvious that if the repairs and alterations are carried out without regard to the suitability of the material and treatment, or so as to involve the destruction of the proportion of the design, much damage may result. Bearing this in mind the representatives of Local Authorities, building owners and others should consider what method will be most convenient under their local conditions for securing the end in view; whether it will be best to co-operate with some voluntary advisory committee, or whether to appoint for the different districts an architect who has such knowledge of the locality and has had such experience of the kind of work contemplated, as will enable him to give the best advice in each case. In some localities it will probably be found that an architect of the requisite experience, perhaps one who has retired from general practice, will be willing to give up his whole time to such good work, but there can be no doubt that a far greater general benefit would result if it became generally recognised that in cases where the reconditioning of ancient cottages was concerned architects all over the country were prepared to give their services free. When advice given free on one occasion is found to be good advice, it will be sought on other occasions when the granting of it will quite properly be accompanied by the demand for its appropriate professional fee.

Notes and Comments

The New President of the R.I.B.A.

The election of a new President of the Royal Institute of British Architects is always an event of very great importance to the profession. It is fortunate that in the ranks of architects are to be found a number of men who are not only artists but accomplished men of affairs who are able to shoulder the high responsibilities of this office. The scope of the activities which may normally be undertaken by the President of the Royal Institute of British Architects is well illustrated in the record of the outgoing President, Mr. Guy Dawber, who has shown himself to be a doughty champion of all the causes which architects have at heart. No president of recent years has done more than he to stimulate public interest in architecture and to acquaint the public of the fact that the architectural profession has an important function to perform in the body politic. It must be a source of gratification both to him and to others that, in vacating the Presidential Chair, his place will be filled by so worthy a successor as Mr. Walter Tapper, A.R.A. The President elect has a record of distinguished work, mainly ecclesiastical, which has brought his name to the forefront among English architects of to-day. One need only refer to his Church of the Annunciation, Quebec Street, London, and the numerous other churches in the North of England which have been erected from his designs, in order to bring to mind the special excellencies which mark his architectural achievement. Mr. Tapper also enjoys the distinction of being architect to York Minster and a member of the Committee of Honorary Consulting Architects to the Church Building Society. He will receive the good wishes of the profession on entering upon his period of office.

The Geneva Competition

The result of the League of Nations Competition has justified the suspicions of those architects who, in spite of the lure of great prizes, declined to enter for it. It appears that out of the 377 designs sent in not one has been considered worthy to be premiated, the excuse being that none of them were suitable for execution. This is a somewhat astonishing result when it is borne in mind that the conditions for the competition were drawn up with quite unusual exactitude, and especial pains were taken to impress upon the candidates the necessity of bringing the cost of the building down to a declared standard. Is it really to be inferred that not one of the 377 competitors, who must have numbered among them some highly competent if not brilliant designers, was capable of preparing plans suitable for execution, or was it only the elevations which offended the susceptibilities of the assessors? Some very important points of professional procedure are here involved, and architects in this country will watch with considerable interest the outcome of this decision. If it so happens that the League of Nations Chamber and new quarters for its secretariat, one may respect such a decision, while perhaps being a little curious to know why it was not arrived at before calling upon so many architects to devote months of gratuitous labour over the preparation of

the plans; but if, on the other hand, it comes about that these buildings are, after all, erected and their designs resemble in certain respects one or more of the schemes submitted in this competition, there will be great indignation among the ranks of the competitors who will feel that they have a legitimate grievance. There have already been too many instances in the past when the promoters of architectural competitions have escaped from their obligations to employ as architect for the projected building one of the successful competitors and to pay him fees (the prospective receipt of which was no small part of the inducement offered to the candidates), and then, having refused to acknowledge their obligation under this head, they have proceeded to appoint an architect of their own choice who is encouraged to make a hotchpotch of whichever of the designs submitted strikes him as suitable for exploitation. In the present instance, although the principal award has not been given, 27 designs have been selected as having special merit, and the first prize, amounting to about £6,000, has been divided amongst them. It would be improper at this stage to say more about the decision, which, however, will give rise to further comment when the assessors have issued their report.

Canberra

The new Federal Capital of Australia, which was opened in state by the Duke and Duchess of York on May 9, marks yet another stage in the progress of civic design. Canberra differs from all other capital cities of the past in that it is being built on virgin soil. The political circumstances which were the cause of the remarkable decision to build a great capital *de novo* are peculiar to Australia, where it was necessary to avoid elevating any particular one of the capitals of the various Federal States, which were theoretically of equal status within the Dominion, to the position of Federal capital. Consequently a new site had to be chosen, and the attempt to build a great city where a few years ago there was nothing but grazing land seems one of the most romantic

Mr. Walter Tapper, A.R.A., who has been nominated by the Council of the Royal Institute of British Architects to be the next President.

adventures in the history of architecture, in that it has been necessary to plan in advance for a large population which, as yet, has not arrived, and of which the social needs are not yet fully determined. One hundred and thirty-seven designs for the city were submitted early in 1912, and the first prize was won by Mr. W. B. Griffin, of Chicago, whose scheme allotted splendid sites for Parliament House and the main administrative buildings. The site of the city itself is a large amphitheatre in the valley of the river, and in all directions distant views are afforded of lofty mountain ranges and picturesque hills of lesser altitudes. Canberra thus appears to possess advantages of aspect such as no single capital of the past has possessed—a great river, hills not so very different in formation from the seven hills of Rome, a mountainous background such as was possessed by Athens, and yet a sufficiency of plain for the formal planning which is the distinction of Paris. What more delightful occupation could an architect have than to contribute to the creation of buildings worthy of such magnificent environment?

THE OLD OAK. By A. J. MUNNINGS, R.A.

PAINT AND POINT AT THE ROYAL ACADEMY

A large and interested public has already visited this year's summer exhibition at the R.A. Among these visitors have no doubt been a certain number of people seeking to purchase pictures.

Now whether these pictures be purchased for pleasure or for profit, there is, short of destruction, but one kind of destination possible for each, namely, to be hung on a wall in an enclosed space.

A picture fulfilling such a simple and popular destination may, however, produce quite alarming and complicated results. Among these results we are here chiefly concerned with the art of the architect who has designed an enclosed space, and on whose walls is to hang one or more framed pictures.

It is rare enough, alas, in such a case for the architect or decorator to be consulted in the matter of selection of these pictures. He is more commonly notified of the choice beforehand, and has to adjust his scheme to suit.

This article is just a speculation on the opposite assumption. It assumes that the professional decorator be in a position to choose from this year's exhibits such pictures as he would really welcome either for the enhancing of any preconceived scheme or to dominate an entirely fresh one.

We will not consider here a large number of pictures which are quite pleasant, and which could hopefully be hung in any room without harm to the decorator, but which could just as easily be omitted without loss to the decoration.

All paintings are more or less decorative, because that is the quality of paint. There is, however, a wide difference of opinion between the painter and the decorator as to what is suitable matter, either in subject or treatment, to help the decorator's work.

There is a fundamental error in the minds of many painters, in the first place, that the decorator's picture must be a composition of "nudes," the most difficult of all subjects to live with, and, therefore, little suited to any room, save in a public building. What architect or decorator, for instance, would choose Mr. Proctor's "Judgment of Paris," with its three almost life-size nude figures, as the dominating

picture in a room? Nor would the decorator find preferable Mr. Harry Morley's "Danaë," or Mr. A. E. Cooper's "Venus and Cupid." It seems a pity to rule out Mr. Spencer Watson's remarkably fine nude in Gallery 3, but it is not probable a decorator would use it. The picture would be far more suited to an art gallery than anywhere else.

What architect or decorator, on the other hand, visiting the Tate Gallery, would not gladly welcome Van Gogh's painting of a simple chair for decorative purposes in a room? Yet the last named follows none of the old accepted canons for a decorative picture, and the former conform to many. In fact, there was probably in every case no other object in the artists' minds than the creation of a decorative painting.

This question of choice of subject for decorative painting really needs a little thinking about.

If a man buys a picture with the chief urge of a possible pecuniary speculation behind him, we are not here expending much sympathy on him if he finds the subject of the picture distasteful to live with. On the other hand, if a man buys a picture to be his companion in his intimate home life, the subject has importance for him.

He probably finds the greatest pleasure in subjects taken from contemporary life. What has the mythological tale of the "Judgment of Paris," or any such tale, to do with him? What use has he for painted groups of the "Three Graces," of figures draped in togas, or of allegorical compositions delighted in by painters of past periods? In his heart of hearts he would probably much prefer depicted a flight of pheasants, a scene from the hunting field, or some such modern subject as "The Enchanted Road," by Mr. Frank O. Salisbury, in Gallery 6, depicting the journey of a fast car through a forest road at midnight. The flight of screaming gulls, painted by Mr. Herbert Truman, in Gallery 5, and entitled "Wings and Waves," would please many a man for his country house, far from the sea. It is, moreover, a good decorative subject, and well painted.

The same lack of sympathy in subject between creative artists and public is noticeable in the musical

world. For years past the most able musicians have devoted themselves to academic music in form of symphonies, sonatas, string quartets, and other kinds of chamber music. This music has been listened to by the very few. The large public who hear music are those who attend cinemas and theatres. The fare given them could well receive more interest from composers, possibly to the loss of the small concert going public, but eventually to the raising of the musical standard throughout the country.

To return, however, to decorative painting. Apart from subject there is the question of treatment. There is an entirely erroneous tradition among some artists that a flat, colourless composition is demanded. Among others there is an equally fallacious idea that the "poster" type is required. It is most disappointing to find such an example, for instance, as "The Froth Blowers," in Gallery 6, coming from the brush of Mr. Walter Bayes. It would be extremely hard for a decorator to have to handle it, even in a popular restaurant. Mr. Greiffenhagen, R.A., is also disappointing in this respect. He is a remarkable decorative painter, but his work, of which a typical example is shown in Gallery 3, entitled "The Pool of Bethesda," could not satisfy the decorator on account of this poster character, with its startling but disconnected values. The object of the poster, in the advertising world in which it started, is to shout, to create attention. The decorator's picture does not demand these qualities.

Every painting should be a decoration and more or less flat, not a hole in the wall nor a suddenly frozen scene from the motion pictures.

A painting becomes truly decorative by means of the intrinsic merits of its line and colour relations. It should have the ability to please for a long period of time as an abstraction of pictorial qualities, of mass and colour, apart from its subject matter. Some of the most beautiful and truly decorative paintings in the world are true realism. In other words, true delineations of contemporary life. Time in some cases has produced a glamour for us in pictures painted in the past, portraying incidents, costumes, and actions, that invite sentiment and interest on that account. Such pictures have distinct value, of course, for the decorator in period styles.

In regard to the original painters of such subjects, however, and among them would be included Oriental artists of the past, the subject matter must have been too ordinary to hold particular interest for the artist at the time by its novelty. Any painter, therefore, who uses any moment of his age need not worry about its usualness, or its modernity. If his work has the true spirit of decoration behind it, it will sing no matter what the source of the melody.

For this reason the decorator would welcome a work by Mr. A. J. Munnings, R.A., far more readily than by Mr. Greiffenhagen. The former artist has specialised in more or less realistic paintings of the turf, of horses, dogs, and gipsy caravans. He has, however, a particular atmospheric effect of light common to all his pictures. This atmospheric light, while admitting the use of the most brilliant colours, keeps the whole painting flat and in place on the wall.

Look at any of Mr. Munnings's six pictures exhibited this year and realise this.

The pictures are rather on the small side for the decorator, but the "Old Oak," in Gallery 3, would be most welcome for use in almost any scheme, be it a modern or period room.

Mr. Vicat Cole's "An English Canal," in Gallery 8, has also a flat atmospheric quality, which, coupled with its delightful tonal qualities, would be gratefully acceptable for use by any decorator.

Mr. Sidney Lee, A.R.A., from the same point of view, mars a fine composition, "The Theatre of Marcellus," in Gallery 2, by this absence of flatness through atmospheric effect. His landscape, "The Pack Horse Bridge," in Gallery 8, is much more successful. In his six works throughout the Gallery he shows himself very nearly a decorative painter of notable merit.

Wandering through the galleries with the trend of thought, or possibly bias, suggested above, it is rather remarkable to discover the inevitable nature of the pictures that the decorator would choose.

It must be presumed that the painters of such subjects as landscapes, still lifes, architectural interiors and exteriors, subject pictures, etc., painted their pictures with a view to providing decorations to walls as their first and foremost aim. It is equally to be presumed that the painters of portraits painted their subjects with the first object of recording a likeness of their sitters and of making them the avowed subjects of their paintings. One is, however, drawn to the strange conclusion that the portrait painters provide the decorators with the type of paintings they seek, and that quite apart from the personality of the subjects.

One recalls two recent pictures of the year, Mr. Orpen's "Chef," and Mr. Walter Russell's "Mr. Pilly." The association of "The Chef" with the Café de Paris has, of course, interest for some people, but who is, or was, Mr. Pilly? The question is entirely without importance. The pictures received wide public appreciation on account of their character and treatment.

There are several portraits this year that are full of interest to the decorator. Mr. Glyn Philpot has created a beautiful work in his portrait of Mrs. Henry Mond. This painting would go with almost any scheme of decoration and enhance it tremendously. The skilful introduction of red pinks and blue-green against black and low tone grounds would give the decorator every chance for introducing bright notes of colour in the general scheme, and still leave the picture omni-present.

Mr. Russell Flint's, A.R.A., "Flowers and Lacquer," in Gallery 3, is but a portrait so far as its subject matter is concerned, and suggests at once black and gold lacquer for furnishings of the room in which it will hang.

The "Black Shawl," by Mr. Lewis Baumer, in the same gallery suggests a scheme in dusky blue and gold.

A most interesting decoration is in Gallery 2, by Mr. G. F. Kelly, A.R.A. It is the portrait of a Doctor of Science in his robes of scarlet and shot-grey pink, a most attractive beginning for conceiving a room.

A landscape painting that might suggest the same treatment of room is in Gallery 11, by Mr. Marius Meronti. The subject is treated in a modern manner and depicts red volcanic mountains with a hot mauve-pink and tan landscape in the foreground. Unfortunately this picture errs on the small side and is not large enough to form a central composition in a room. It has, however, some excellent qualities.

The reason for a prevailing preference for the portraits this year is not entirely on account of the painting of them. The subjects of them vividly represent contemporary life, and this gives them great advantage in their appeal to us to-day.

Portraits are amongst the most decorative of all paintings in subject. No one can justly say that a great portrait of any period is more or less decorative than that of another one. The modern bowler hat or plus fours can still give the portrait painter a chance of greatness. It is to be acknowledged, however, that it demands the services of a first-class painter.

Fig. 1.—A TYPICAL OFFICE IN THE AMERICAN RADIATOR BUILDING.

SOME DETAILS OF CURRENT PRACTICE IN AMERICAN OFFICE BUILDINGS

By HOWARD ROBERTSON, F.R.I.B.A., S.A.D.G.

The high rate of wages obtaining in the United States for the majority of administrative and clerical occupations has made it imperative that working conditions should be as ideal as possible. It is for this reason that such a high standard has been reached both in the planning and equipping of business premises, for it has been found by experience that the added outlay required for scientific designing and construction is more than counterbalanced by increased business efficiency and higher output.

Although it would be difficult to prove a case for a greater daily output on the part of business offices in the United States as compared with London, yet it seems certain that there is a higher atmosphere of pressure than that to which we are accustomed. The very atmosphere of American cities appears to be charged with an almost electric energy. Movements are more abrupt, and human action generally is pitched in a sharper key. The spirit of energy is always

apparent, and is rarely in repose. The demands on the nervous system are no greater in the aggregate than would be the case in England, but they are more inclined to be sudden and intense.

America is, in fact, a country of extremes. Its people are subject to the ups and downs of physical and mental well-being in the same measure as its climate revels in extremes of heat and cold. This characteristic, geographical and racial, has made it necessary in American design to introduce every possible device for equalisation of conditions, such as the neutralisation of heat and cold, the conservation of nervous energy through the introduction of devices which avoid needless waste in the performance of non-essentials, and elimination of all possible factors which are destructive of physical welfare and efficiency.

The rapid growth and development of American business is the factor which has made it comparatively easy to keep pace in building with

every scientific discovery; in a new building of any importance it is taken for granted that the latest innovations in the matter of comfort and convenience will be incorporated.

The architect in America is assisted, in the matter of equipment, by the large number of excellently-made standardised fittings which are already upon the market. And, further, it is typical of American enterprise that as soon as there is a demand on any scale for some new device or improvement of equipment, there will in a very short time be a supply ensured on a commercial basis.

The majority of American business premises are well arranged from the point of view of plan organisation; that is to say, there is a maximum of unencumbered well-lit space, with the elevators, toilets, ducts, chutes, stairs, etc., grouped as far as possible in a self-contained core, its location depending on the site. This is the method adopted in the Tribune and Radiator Buildings and in the new Barclay-Vesey Telephone Building illustrated in *THE ARCHITECT AND BUILDING NEWS*, January 7, 1927.

The window area is as far as possible retained for working purposes (American building ordinances per-

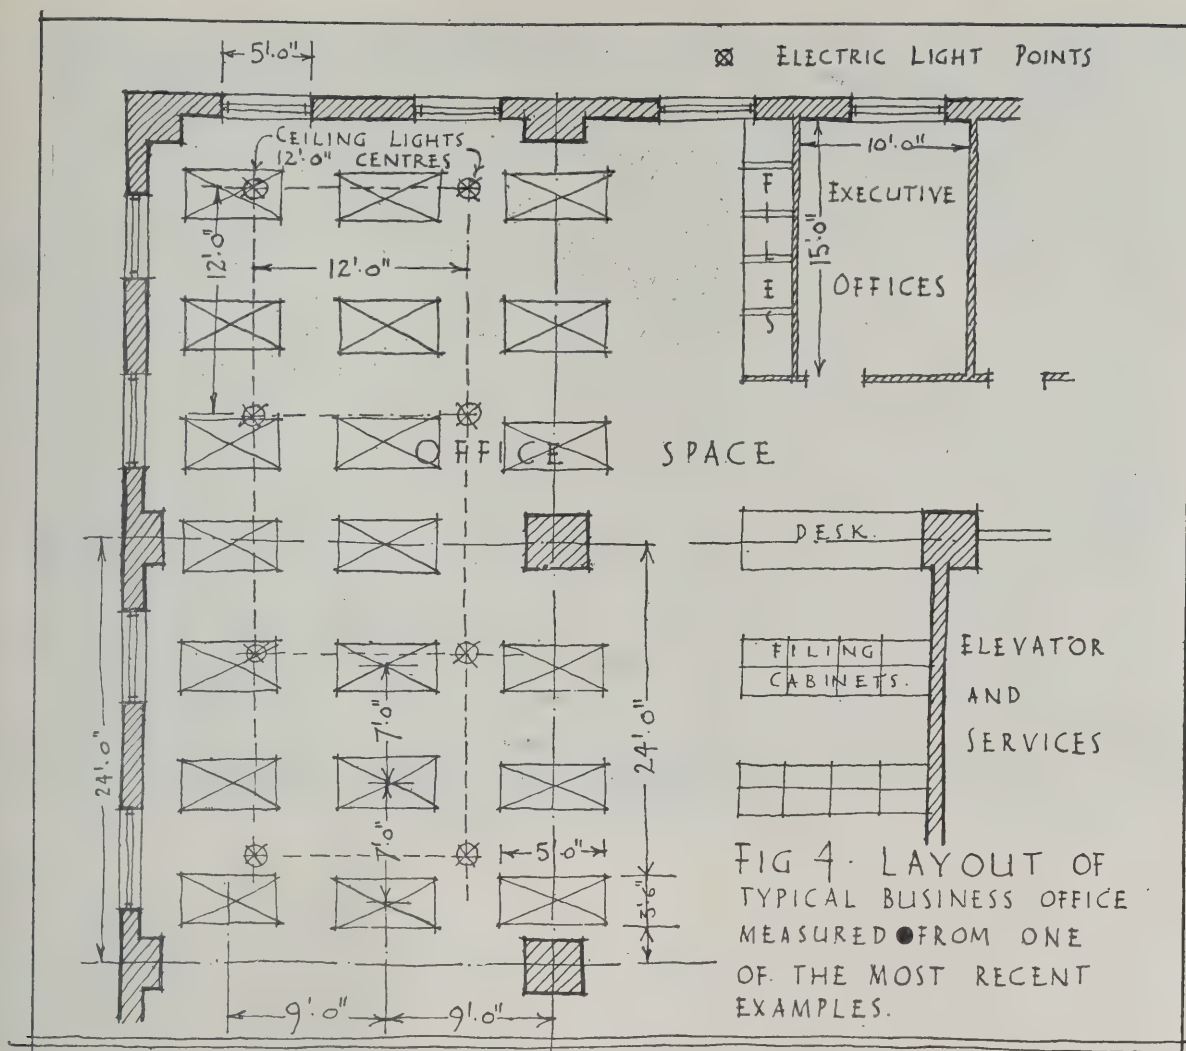

FIG 5

SKETCH SHOWING METHOD OF TAKING TELEPHONE LEADS TO INDIVIDUAL DESKS

mitting the ventilation of lavatories by shafts or ducts), and it is rare to find a building which is under-windowed. A favourite arrangement is that of windows grouped in pairs, as it permits of ample light concentration without the disadvantage of an unwieldy unit.

Window sizes depend, of course, on many factors, including the height of floors. The height from floor to the underside of the main beams in the office shown in Fig. 1 is 9 ft. 6 in., the beam itself showing 18 in. below the ceiling. A fairly usual height from floor to floor is 11 ft. 6 in. In the American Radiator

Building the floors were made to average 12 ft. 6 in.; in the whole height of the building one floor was lost, but it was held that there were more than compensating advantages in the added loftiness of individual storeys.

The windows shown in Fig. 1 measure 5 ft. x 7 ft. overall, those in Fig. 2 are 3 ft. 6 in. x 8 ft. In nearly every case windows are fitted with some type of draught preventer, either fixed or adjustable. The type shown in Fig. 3 is a standard fitting, and of interest in this connection also is the method of placing the radiator grille in the window sill, allowing

Fig. 2.—ANOTHER TYPICAL MODERN AMERICAN OFFICE.

an aperture at the junction of wall and floor by means of interrupting a section of the skirting.

Most offices are now provided with some sound-deadening finish, a common method being the application of felt and celotex, the latter being affixed to battens and separated from the felt by a 1-in. air space. Acoustic-celotex is, of course, a proprietary article, but there are other materials which serve the same purpose. Celotex has, however, the advantage of easy fixing and good appearance; in fact the type with perforations exposed produces quite a decorative effect with its suggestion of poker-dot patterning.

Artificial lighting receives the fullest attention, as the juxtaposition of tall buildings entails artificial light in the vast majority of the lower floors in the business districts. The semi-indirect translucent bowl fitting seems to be the most popular type, and as a rule ample wall plug connections are provided for desk lamps, etc., these being often placed on the stanchions, not centrally but to one side, so that if partitions between stanchions are at any time erected they may be spaced out to the centres of the piers.

Most commercial firms favour the large open office space sub-divided by low glazed screens. A section of the main office will in this way be partitioned off to provide greater privacy for the administrative staff, but the directors and high officials are generally provided with private rooms, often very elaborately designed and furnished.

Every American office is fully equipped with telephone service, but as the location of desks is sometimes uncertain, and it is not desired to perforate a carpet or linoleum to plug into a sunk connection in the floor, a compromise is effected by the method shown in Fig. 5. The small, flat metal tube, measuring 1 in. x $\frac{3}{8}$ in., is slightly rounded on its edges, and offers no obstruction to the foot.

Last, but not least, in American office equipment comes the ice-water container, a huge glass cylinder complete with nests of hygienic paper drinking cups, which is kept constantly renewed by a contracting company, and ensures a supply of pure cooled water under all conditions. The habit of drinking a great

deal of water during business hours undoubtedly contributes to good health and efficiency, and in this way the office is recouped for the expense involved.

Most of the doors and windows in commercial buildings, and what is called the "trim" (skirtings, architraves, etc.) are made of metal, the favourite window being the sash, while the doors are of the type with which we are familiar in England. There is, however, a very practical device which is often incorporated in American doors, sometimes in office buildings, but still more frequently in hotels or apartment houses or in any situation where it is desired to create through ventilation. This consists of a system of louvres, either vertical or horizontal, the principle of which consists in the freedom of passage for air while preventing vision. Adjustment and control of ventilation is thus discretionary, and in hotel bedrooms, or in interior toilet rooms with exhaust ducts, the system provides a considerable aid to natural ventilation while ensuring privacy.

There is no doubt that the backwardness in some respects of our building regulations has a hampering effect on the general planning of our own business premises in England. At the same time we do not, perhaps, approach the problem in quite so scientific a spirit as our American colleagues; for this, no doubt, the easier nature of our national temperament must take the blame.

The foundation stone of a new nurses' home, which is being added to the Kingston and District Hospital, was laid recently. The total cost of the additions will be about £100,000, and the plans have been prepared by Mr. F. Danby Smith, F.R.I.B.A.

A memorial to Queen Alexandra is to be erected on a site facing Friary Court by Marlborough House, which will be recessed in the garden wall; and the committee for this personal memorial have accepted in a modified form a design by Mr. Alfred Gilbert for a group in bronze, typifying Faith, Hope and Charity.

New Ways and Means

The Editor will welcome early information of
New Plant, Materials and Fittings

The "Highgate" Infants' Bath.
(The Leeds Fireclay Co., Ltd.).

A Sanitary Fitment for
Hospital Use

Messrs. The Leeds Fireclay Co., Ltd., of Wortley, Leeds, are the makers of the "Infants' Bath," shown in our first illustration, which has been specially designed for hospitals, maternity homes and children's welfare centres. This fitment is white glazed inside and outside, and is provided with a large waste and overflow chamber to permit of easy cleaning. Patent hot and cold supply taps having porcelain enamelled delivery nozzles with quarter-turn lever handles, are also fitted, the handle operating the hot water being enamelled red. A similar suite can be supplied fitted with one supply nozzle through the end of the bath in place of the separate nozzles as shown in our sectional sketch.

A Steel Smoke Chamber for
Fireplaces

Although the use of a properly designed damper will eliminate most of the troubles from smoke in an open fireplace, the ill-effects of a badly constructed smoke chamber cannot be disregarded, for the success of a fireplace depends largely upon the elimination of friction to the rising smoke, and the presence of ragged brickwork must necessarily increase friction giving in

consequence a poor draught. In view of this, Messrs. The H. W. Covert Co., of 243 East 44th Street, New York, U.S.A., have recently introduced to the American market a steel form for use in making a smooth connection between the fireplace opening (including the damper if used) and the flue lining. This device consists of two steel plates, a collar the same size as the flue lining, and four bolts for fastening. The mason bolts the two plates to the collar, places the form in position, and builds his brickwork around it. In this way a smoke chamber giving the minimum friction is assured, such as cannot be obtained when brick alone is used. The device is packed and shipped flat, being supplied in two sizes for flues 8½ x 13 in. and 13 x 13 in. respectively.

A Novel Casement Fitting

A combined stay and fastener for casements, which is fixed to the side members of the casement and case-

The "Simpson" Patent Stay and Fastener.
(A. Thoumaian.)

ment frame, in the position usually occupied by the ordinary cockspur, where it is out of the way, has been placed on the market by Messrs. A. Thoumaian, of 1-2 Hainault Road, Chigwell, Essex. The use of this fitting, which is shown in three positions in one of our illustrations, claims to overcome unequal stresses produced in the upper and lower members of the casement under pressure of the wind when the casement is open, this being impossible in cases where the stay bar is fixed to lower members. The hinged joint provided in the stay bar is also a novel feature, for this allows the bar to be bent when the casement is only partly open for ventilation purposes, so that there is the minimum projection into the room. The casement,

The "Covert" Smoke Chamber as built
into Brickwork of Fireplace.
(The H. W. Covert Co.).

moreover, cannot be left unfastened, for when closed the stay bar drops down and is automatically locked.

A Patented Construction for
Concrete Cavity Walls

Mr. James Cramer, F.S.I., of 4 St. Mary's Parsonage, Manchester, has recently patented a system of construction which is claimed to simplify the production of cavity walls, using "poured-in" concrete in conjunction with pre-cast piers. The essential feature of this new system is a collapsible cavity shuttering supported upon a series of metal clips embedded in the wall during the formation of the latter, where they serve in the rôle of wall ties. This cavity shutter is made of timber in the form of two leaves, which are kept apart by loose rods and held secure by the metal clips already referred to. At the same time, the outer faces of the wall panels are shaped by the use of a climbing shutter, which is carried by bolts passing through metal tubing set into the concrete pier blocks. The planks used to secure this climbing shutter are rebated at the edges to allow the shutter itself to slide to any height, keeping pace with the collapsible cavity shutter, as the work proceeds. In practice both sets of shuttering are coated with bituminous paint to facilitate removal from the concrete surface.

PARLIAMENT HOUSE, CANBERRA: CORNER OF ONE OF THE COURTYARDS.
W. BURLEY GRIFFEN, Architect.

THE HOUSES OF PARLIAMENT, CANBERRA

Parliament House is first of the great buildings of Canberra to be completed, and is thus at present the main object of architectural interest in the city. It stands in the centre of the area set aside for governmental purposes, which is being converted into a huge park, the various official buildings being disposed between gardens and avenues of trees. Unfortunately, in consequence of the economic after-effects of the war, the postponement of many of the monumental works contemplated in the original plan, such as ornamental lakes and high level bridges, became essential, and it was decided to substitute works of utility to meet the requirements of the next generation or two, at the same time conserving all the principles of the adopted plan so as to leave the way open for carrying out its more ambitious projects at some future date.

Parliament House may be seen from a considerable distance in almost every direction, and magnificent views are obtained from its balconies and its flat promenade roof. As is seen from the illustration, it is a large white building of simple and dignified architecture, and covers about $3\frac{1}{2}$ acres. In addition to the two main legislative chambers it contains a library, dining and recreation rooms, and extensive accommodation for offices, party rooms, and for all those services which are essential for the Parliamentary machine.

Detailed examination of the building reveals the fact that while it has a certain stateliness belonging to its long white elevation, with its pattern of rectangular windows relieved by the four round-headed openings in the four projecting bays, it yet suffers from a certain lack of unity, inasmuch as the low central portion of the façade is not important enough to dominate over the two prominent pavilions on

either side of it. Apart from this, however, the proportions of the building are pleasing, and the detail highly effective in its classic simplicity.

The offices for administrative departments and services include accommodation for the national library, main central post office, automatic telephone exchange and Government printing office. These buildings are all in keeping with the design of Parliament House. Although they will serve for the initiation of the capital, they do not represent the permanent buildings contemplated in the design, and will be put to other uses when their more monumental and permanent successors can be built. The opening of a large Government hotel—the Hotel Canberra—in 1924 permitted the city to enter upon a new phase, for this building has become a necessary rallying point for social intercourse. Three other hotels have been completed by the Federal Capital Commission responsible for construction of the city, which has also provided halls in residential localities which are available for educational and social purposes.

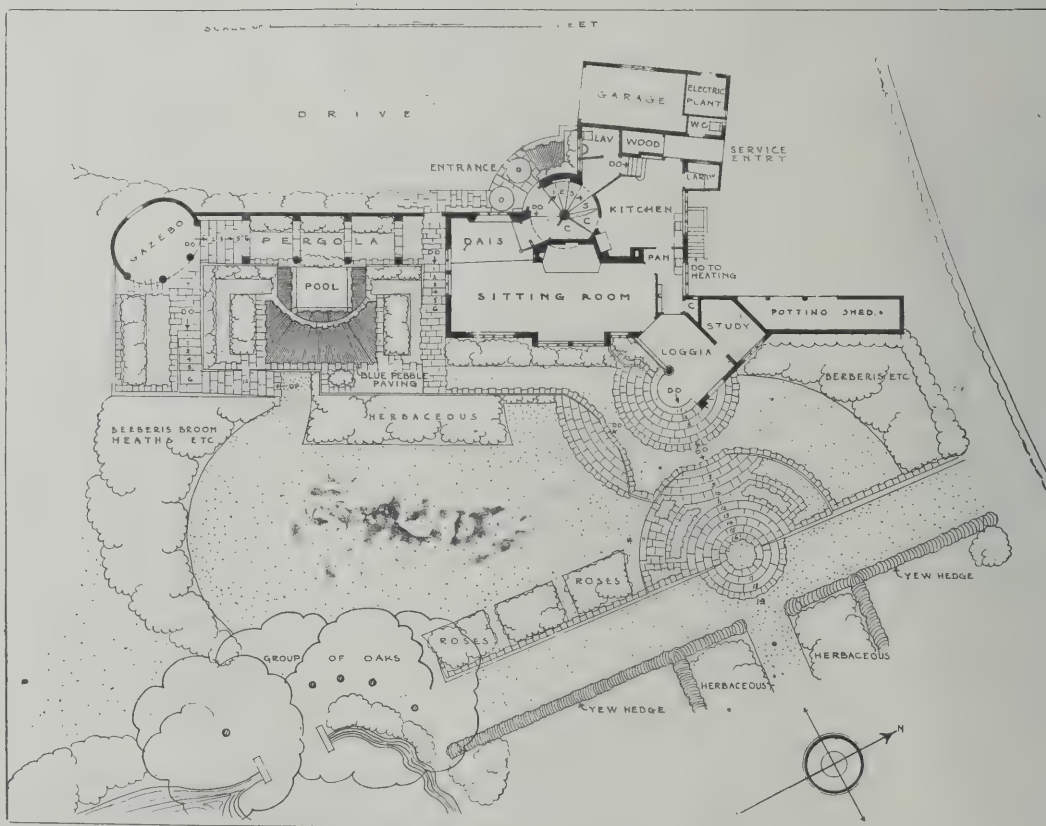

Care has been taken to ensure that commercial buildings at the civic centre are of a design worthy of the city, and schemes for the lay-out of shopping blocks in this area have also been prepared in advance, the lessees being required to build according to definite general plans. In the near future a building will be erected for the Australian War Memorial, and will house the Memorial Museum and a monument to the Australians who lost their lives in the war. Among other buildings of a public character which have been provided for are the Australian School of Forestry, a Museum of Zoology, and the solar observatory on Mount Stromla. The present development at the civic centre by banks, financial institutions and other important concerns indicates marked confidence in the future of Canberra.

THE SOUTH WALES INSTITUTE OF ARCHITECTS

Exhibition of Photographs of Modern Architecture

A very good propagandist work is done by the various local architectural societies which periodically organise exhibitions for the education of the public in matters architectural. That such propaganda is exceedingly necessary is obvious to everyone who goes about the provinces and realises that there are still large sections of people who do not know what an architect is, and who would never dream of employing one even in the event of their desiring to build new houses for themselves. The main function of such exhibitions is to stimulate public interest in architecture, and by presenting for public inspection an assortment of the best architectural designs executed in a given locality, to persuade building owners and others interested in estate development that architecture is both a science and an art, and should only be practised by those who have qualified themselves to become members of a learned profession. In Wales, in particular, there is need for this educational propaganda, for it must be confessed that during the last fifty years the principality has not been distinguished for the beauty of the buildings erected in it, and many have been the protests on the part of critics who have sought to remind the inhabitants of Wales that a country which is renowned for the cultivation of music and literature cannot claim to possess the highest cultural development unless it also devotes itself to the visual arts. Wales, however, has one very considerable modern architectural achievement to its credit, namely, the superb group of public buildings in Cathays Park, Cardiff, which is unrivalled in any city in the kingdom, and this fine group, which includes the City Hall and Law Courts, the National Museum (recently opened by the King), the Glamorgan County Hall, Cardiff College, and several other important buildings, provide evidence that the Welsh people have great architectural ambitions which only need the requisite opportunity for their realisation. Moreover, in recent years greatly

improved educational facilities have been placed within the reach of architectural students in Wales. One may mention in this connection the excellent architectural school at the Technical College, Cardiff, which is presided over by Mr. W. S. Purchon.

In this exhibition of designs by members of the South Wales Institute of Architects one naturally looks for evidence of the formation of some style or tendency characteristically belonging to a Welsh environment. It must be confessed, however, that, as far as architecture is concerned, Wales does not make an individual national contribution, but is content to try to achieve a kind of architectural accomplishment similar to what English practitioners are aiming at. This is but natural, and there is no need to lament about it, for the conditions of modern civilisation are such that the Arts are ceasing to take note of geographical boundaries, and the styles which are practised in the various countries are gradually conforming to a single cosmopolitan standard. The fact that the beautiful City Hall at Cardiff, designed by Englishmen in the English Renaissance manner, does not in the least detract from the pride which Welshmen have in it, and the architecture of Wales has everything to gain by submitting to the general cultural trend which finds expression in England as a whole. Any attempt on the part of architects to be consciously and aggressively Welsh will only lead to stylistic affectations. Fortunately no such attempts are registered in this exhibition, which contains many interesting works by artists who have no other object than to give a straightforward modern solution of the problems put before them. For instance, the house near Cardiff, designed by Messrs. Ivor Jones and Percy Thomas, is an excellent example of the modern Georgian style which is being practised in England. It is worth while recording the fact that in the 18th century, when the elegant prototypes of this building were being erected in England, similar

ALMSHOUSES, CARDIFF: STREET FRONT.
IVOR JONES AND PERCY THOMAS, Architects.

buildings also arose in Wales, where there is still much excellent Georgian work to be found by those who know where to look for it. This particular example is a sedate and comely brick structure with low roof and parapet wall; the long frontage has two rows of seven windows, the lower row being distinguished by shutters, and a central doorway with bracketed segmental pediment pleasantly detailed. This house, by its restraint and good proportion, should have a salutary influence, inasmuch as it shows how an attractive and dignified home can be created without the designer adopting the meretricious devices of decorating his building by numerous half-timbered gable ends. The design for almshouses at Cardiff, by the same architects, is also an attractive proposition, in which a single storeyed structure is given a hipped tile roof with wooden dentil cornice and pedimented gable over the front entrance upon the street, while on the garden side we see a verandah which, though constructed with strict regard to economy, serves to introduce the requisite rhythm to the façade in spite of the fact that the fenestration behind the row of wooden posts belongs in part to the minor domestic offices. The Girls' High School, Barry, by Mr. Harry

Teather, has an attractive interior, here illustrated. The assembly hall of this building is a spacious apartment of interesting design. The large round-headed windows have pilasters in between which support the ribs of the segmental roof, while the lower part of the hall is marked by panelling in dark wood. A house in Penarth, by the same architect, represents an interesting attempt to combine rubble walls with weather boarding and red tiles, but it is perhaps questionable whether the resultant effect is altogether harmonious.

Designs for various housing schemes are here exhibited. That by Mr. Gordon Griffiths at Cardiff, of which an illustration is shown, is of special interest in that it represents a return to the terrace formation. The open space, enclosed by the rows of houses, has a pleasant scale, while the row of bay windows on the ground floor helps the composition considerably by making this the dominant storey, so that the façades have been appropriately unified. A detached house by the same architect does not give him so much scope for his abilities, and indeed it represents a type which could not appropriately be multiplied in

Cardiff Exhibition

(Continued from Page 821)

a residential district. The designs for the Medical School and Laboratory at Cardiff by Mr. G. B. Fletcher are in the Tudor style, which certainly has the advantage that it makes possible the tradition of plenty of window space. The laboratory room here illustrated appears to be well adapted for its purpose. Mr. T. Alwyn Lloyd, who has been responsible for a large number of housing schemes both in Wales and elsewhere, shows some interesting designs for small houses in the garden villages at Barry, Rhiwhima, Caerphilly and Barry Port in Wales, and at Acton and Braintree in England. He also shows three attractive models, the one of contour model of an estate and the other two of parlour and non-parlour houses. Other notable examples of domestic architecture are Penllyn, Lisbane, Cardiff, by Messrs. Richards & Maclean, a house by Messrs. Grant & Goodechild at Llandaff, and of commercial buildings one may mention Cox's Café, by Messrs. Phillips & Winde; a well-designed new entrance to the Swansea Hotel, by Messrs. Rogers & Ward; a large café at Barry Island, by Mr. F. S. Swaseh, of Newport. Warehouses and offices are represented in the work of Messrs. Edwards & Jones, Mr. Harry Teather, Messrs. C. S. Thomas & Herbert Jones, of Swansea. Messrs. Willmott & Smith, whose competitive design for the Grand Masonic Lodge in Great Queen Street, London, attracted so much attention, is represented by the interesting neogrec interior of the Playhouse, Cardiff, an interior of the Masonic Temple, Swansea; St. Edward's Church, Cardiff, in the mediæval style; the Fish Market, Cardiff; a Jacobean domestic interior; and a Georgian façade to a Cardiff house. In all these designs he shows great versatility, but it is perhaps a little unfortunate that so gifted a technician should be required by his clients to ring the changes on such diverse styles. Some interesting churches are exhibited, including Messrs. Bates & Son's church with baptistery at Cardiff; a Georgian chapel at Cwmtwrch and a church with bell gable at Swansea, both by Messrs. C. H. Thomas & Herbert Jones. Mr. John P. Grant's Restoration of Cardiff Castle, both Roman and mediæval, are illustrated in a fine set of large photographs by Mr. F. Yerbury, who has contributed to the exhibition several more fine examples of his art.

Competition Notes

Wimbledon

The B.C. have approved the appointment of Mr. H. V. Ashley, F.R.I.B.A., of 14 Gray's Inn Square, W.C., in place of Mr. Austen Hall, F.R.I.B.A., resigned, as assessor to settle the conditions for and conduct the competition for a new Town Hall, Municipal Offices, and Public Assembly Hall at Wimbledon, on land adjacent to the site of the existing Town Hall, in accordance with the regulations approved by the Royal Institute of British Architects and by its allied societies.

Merthyr Vale War Memorial Competition

The Competitions Committee of the R.I.B.A. desire to call the attention of members to the fact that the conditions of the above competition are not in accordance with the regulations of the R.I.B.A. The Competitions Committee are in negotiation with the promoters in the hope of securing an amendment. In the meantime members are advised to take no part in the competition.

Correspondence

To the Editor of THE ARCHITECT & BUILDING NEWS.

SIR,—Your contributor SCRUTATOR, whose delightful "Essays by the Way" I read with the greatest appreciation, has seen fit with his elegant shoe to "tread on the tail of my coat." In his article on "Plus-Four Architecture" he informs your readers that "A few misguided people, like Mr. Trystan Edwards, may still believe in large residential cities in the grand manner, which shall enshrine an urban politeness," but most people "are fully agreed that towns are to be escaped from, or if escape be impossible, then a garden city or a garden suburb, with its scattered development of ones and twos, is the most that we can tolerate in civil neighbourliness, and even so we feel cramped and long for that unsophisticated country where we can live with every degree of modern comfort."

Well, it so happens that within the last week I have casually encountered no less than six people who informed me with glee that they had sold their suburban houses and were now coming to live in town. "It will be so much more pleasant and convenient." Of course it will. But these intelligent people are naturally choosing as their places of abode those parts of London which were built at a period when estate-owners, architects and builders knew how to make towns agreeable places to live in.

This attractive urban quality, however, which distinguishes many parts of London, is also present in smaller towns and to a certain extent even in the village streets which were erected during the 18th century. I have tried to analyse the formal virtues which are to be found in these examples in order that it may be possible for us to imbue our modern houses, wherever they are placed, with a similar attractiveness. I am grateful to SCRUTATOR, therefore, for giving me this occasion to remove the impression that "the large residential city" is for me the only correct pattern of domestic architecture. My complaint against the owners of villas, bungalows, and week-end cottages which are being erected to-day is that many of them, although they so loudly profess their love of the country, are spoiling the country, so that neither they nor anybody else will be able to enjoy it in the future.

SCRUTATOR's witty description of the "Plus-Four" architecture, the sham rusticity which characterises so much domestic building of to-day, should have a good effect, for when once the tendency to build these "country-cousin" houses has been killed by ridicule, it will be possible to consider the possibility of building compact little satellite towns which will relieve the over-population of the great cities without producing the miles of dreary suburbia such as we now see springing up everywhere. Recently I came across an 18th-century print showing Portland Place shortly after it was first built. Immediately beyond the stately terrace were green fields, trees and an open country-side. This is surely the ideal—an urban existence with very easy access to the country. To accomplish this, however, it will be necessary to restore the popularity of "continuous" building of the attractive architectural composition in which terraces and other large groups of houses can be combined together in urban units. There is nothing to prevent these groups of dwellings having ample gardens and every convenience of modern planning. To-day is the day of the small house, and many hundreds of thousands of such houses are due to be built in the next fifty years. Yet the amount of country is limited. I believe it will be proved that they love the country best who best love the town, for only by collecting these houses in urban groups can the country be preserved.

Yours faithfully, A. TRYSTAN EDWARDS.

Building News in Parliament

WESTMINSTER, Wednesday, May 11.

Government and London Bridges

Yesterday, for the first time, the text of a letter which the Prime Minister addressed on April 26 to the Improvements Committee of the London County Council on the subject of London bridges (and which the L.C.C. considered on the same day) was publicly disclosed. It was read to the House of Commons by Lieut.-Colonel Ashley, Minister of Transport, when he opened a debate upon the estimates for his almost expiring department. The latter was a lengthy one, but its salient points can be briefly put. The Prime Minister expressed a hope that the London County Council might see its way to proceed immediately with the construction of Waterloo Bridge on the lines recommended by the Royal Commission on Cross-River Traffic, especially as much preliminary work, prior to the commencement of the actual operations upon the bridge, would no doubt be necessary. On the other hand, Mr. Baldwin made it clear that the Government desire, for their part, to proceed at once with the suggested inquiry into the financial, engineering and other aspects of the scheme for a double-decked bridge at Charing Cross.

The Minister of Transport, after reading the letter and referring to the previous negotiations which had taken place, stated that the only question which remains outstanding between the Government and the L.C.C. is that of net cost, as this is the basis upon which it is proposed that 75 per cent. of the expenditure is to be contributed from the Road Fund. He added that the L.C.C. had promised to make an early reply to this letter. The House listened to this part of the Minister's statement with special interest, as befitted its importance.

Questions were again addressed to the Minister of Health as to the effect of the reduction of the housing subsidy upon the contract prices of State-aided houses. Mr. Chamberlain replied that the average price of parlour-type houses included in contracts let by local authorities during the first three months of this year was £490, compared with an average price of £513 for the preceding quarter. Mr. Herbert Williams asked whether he was right in assuming that the reduction of the subsidy had resulted in a reduction of the price of houses; but Mr. Chamberlain merely made the guarded answer, "I do not quite put it in that way, but it is certainly a fact that the price of houses has come down."

Mr. Chamberlain announced, in reply to a question, that he would make a statement on the Government's policy as to the future of the Rent Restriction Act before Parliament rises for the summer recess. It was officially promised that the position of people who bought but are unable to occupy their houses would be carefully considered. Sir Kingsley Wood admitted that, in spite of the provisions of the Housing Act of 1923, it is still a very difficult matter for the single-house landlord to obtain the possession he desires.

The liability of steel houses to catch fire was mentioned in the Commons by Mr. Johnston, one of the Labour Members for Dundee, in connection with the destruction in that city of a house of this character. The Secretary of State for Scotland explained that enquiry showed that the conflagration arose through the accidental ignition of the celluloid cases enclosing the accumulators of a wireless receiving set, and was not due to structural defect. He stated that a contract for a further 1,000 steel houses in Scotland has been placed with the Second Scottish National Housing Company, and that arrangements are being made to minimise still further the risk of fire in the new buildings in the light of the experience that had been gained.

Coming Events

Royal Institute of British Architects.—On Monday, May 16, at the R.I.B.A. Lecture by Mr. Lionel G. Pearson, F.R.I.B.A., on "Foreign Hospitals." 8 p.m.

The Institution of Structural Engineers.—On Monday, May 16, at the Piccadilly Hotel. Annual Dinner. The Right Hon. Lord Carson, P.C., K.C., presiding.

Royal Institute of British Architects.—On May 16. General Meeting. Paper, "Modern Hospital Planning," by Mr. Percy Adams, F.R.I.B.A.

The Southend-on-Sea and District Society of Architects.—On May 18. "Art and Social Life in the 18th Century."

The Royal Society of Arts.—On May 18. Ordinary Meeting. "Industrial Welfare in Great Britain and the United States," by Robert R. Hyde, Director of the Industrial Welfare Society.

Town Planning Institute.—On Friday, May 27, at 6 p.m. General Meeting. Messrs. W. H. Gaunt O.B.E. (A), and Nigel Norman, B.A., will read papers entitled "Transport."

Royal Institute of British Architects.—On May 30. General Meeting. "Devonshire House Buildings." Mr. Thomas Hastings (H.C.M.).

The Surveyors' Institution.—On Tuesday, May 31, at the Zoological Gardens, Regent's Park. Afternoon Reception.

Royal Academy of Arts.—In Westminster Abbey on Thursday, June 2. The Annual Service for Art. 5 p.m.

Institution of Municipal and County Engineers.—On Thursday, Friday and Saturday, June 2 to 4. Meeting of the Institution to be held in the Scottish District at Dunfermline.

The Institution of Municipal and County Engineers.—On June 15, 16, 17, 18 at Torquay. General Meeting and Conference.

Royal Institute of British Architects.—On June 20. Election of Council and Standing Committee. Election of members.

Cement Marketing Company, Limited.—On Tuesday, June 28. Visit of members of Institution of County Engineers to the Kent Cement Works, Greenhithe.

Book Notes

The Orders of Architecture. By R. Phené Spiers, F.S.A. (Batsford, 12s. 6d.).

Possibly more suitable for the professional student than the general reader, this book consists of an explanatory section of text and of a long series of examples from Normad's "Parallel" and other authorities, the styles covered being the Greek, Roman and Italian.

The Law and Practice of Bankruptcy. By G. L. Hardy. (Effingham Wilson, London, 1927).

Towns and the Land. (Land and Nation League, 25 Old Queen Street, Westminster, S.W.1). Price 6d.

Forty Points on Coal and Power. (Land and Nation League, 25 Old Queen Street, Westminster, S.W.1). Price 6d.

Rusticus, or The Future of the Countryside. By Martin S. Briggs. (Kegan Paul, Trench, Trubner & Co., Ltd., London, 1927).

The author of this topical study, himself a lover of the rural England that is now so rapidly being desecrated, is inclined to attribute much of the blame to the invention of the petrol-engine, though he recognises other contributory causes.

Book Reviews

Balbus, or The Future of Architecture. By Christian Barman. (Kegan Paul). 2s. 6d.

This brilliant little book has already achieved a popular success, and is among the very best of that interesting series, "Books of To-day and To-morrow," in which Mr. Kegan Paul have issued at a cheap price a number of popular disquisitions on great subjects by writers well qualified for their task.

Mr. Christian Barman has analysed certain tendencies which are observable in modern architecture and which appear to contain the seed of future growth. The author's argument is founded on the belief that the building of to-day may be as truly a product of our time as the aeroplane or the cinema. He seeks to discover the formal qualities which are the sign of genuine modernity in architecture. Among the movements which have caused these qualities to emerge he assigns the most prominent place to the emancipation of women. The argument is a subtle one, and at first one seems inclined to question its validity, but Mr. Barman presents his thesis with very great skill. One of the principal differences between the architecture of to-day and that of former times is to be found in the new conception of a building as so much cubic space to be let off indiscriminately to a variety of owners. "No longer," he tells us, "is the building composed of an expressive sequence of definitely formed cavities; there is only layer upon layer of formless space, tier upon tier of vacant sites." This new theory of architecture was invented by the builder of the drapery store for his regiments of female customers, who, as the principal consumers of wealth, are entitled to transform the design of our buildings in accordance with their own needs, of which the need to shop appears the most important. The possibilities of "open floor" design for all kinds of building were soon widely perceived and abundantly exhibited. From the shop the new device spread to the factory and office block and even to schools and universities, in support of which latter contention Mr. Barman cites an appeal issued on behalf of the University of Pittsburg. This appeal opens with the statement that 14,460,000 cubic feet of space are required for the university to discharge its normal functions. Even in domestic architecture the same principle is beginning to find expression.

The second great cause of change in the forms of architecture analysed by Mr. Barman is the threatened failure of our communications, which failure, he points out, is not due to any deficiency in these communications themselves, but to the vast and unequal overcrowding of modern cities. He affirms that the power of regulating architectural growth begins to fail when that growth exceeds a certain measure of speed and urgency, and he is led by this observation to analyse the new zoning laws of America, which he foresees will soon be introduced in a modified form into all the countries of the Old World. This is the first serious attempt to analyse the *architectural* consequences of these laws, and Mr. Barman's remarks on this point are of absorbing interest. The reader will also find much stimulus to thought in the author's examination of the effect on architecture of aerial traffic, the significance of "the apartment house," and the influence of feminine apparel on the styles of building. But although he portrays an unpleasant picture of our immediate architectural prospects, he holds out to us a fair future for the art of building when we cease to think of architecture in terms of towns alone and have learnt how to plan the countryside in the grand manner.

This book has not only the vigour derived from its closely-knit arguments, but is further enlivened by a wealth of apt literary allusion and much grace of style.

Notes in Brief

Mr. George Eastman, the head of the Kodak Company, has given the sum of £300,000 to establish a dental, tonsil and adenoid clinic in connection with the Royal Free Hospital, London. The clinic, which will adjoin the hospital in the Gray's Inn Road, is to be modelled on the famous Rochester Dental Dispensary in America, also founded by Mr. Eastman.

What is said to be the largest and probably the finest Roman Mosaic pavement found in Britain is to be removed from Horkstow Hall, near Burton-upon-Humber, to the British Museum.

An anonymous donor has presented a sum of £7,500 to the fund for the repair and preservation of Durham Castle. This is additional to a gift of £2,500 from the same source last year.

The Derbyshire and Cheshire County Councils are considering the widening of the joint county bridge at Marple, the estimated cost of which is £8,500, with probably an additional expenditure of £3,000 in acquiring property.

The dispute between the Liverpool and Birkenhead Corporations regarding the position of the Birkenhead entrance to the Mersey Tunnel has now been settled. The entrance at Woodside, Birkenhead, is to be taken back to Bridge Street and Chester Street, an arrangement that will shorten the main tunnel. An additional narrow tunnel is to be provided to Rendel Street for docks traffic only. An additional cost of £200,000 will be involved, of which the Ministry of Transport will provide half and the two Corporations £50,000 each.

The Memorial to the 1st Division in France, on the Laudrecies-Guise Road, near the village of La Groise, which takes the form of a wayside Calvary, executed by Mr. Richard Goulden, was unveiled recently by Marshal Foch.

A ratepayer, just elected a member of a Yorkshire urban district council, has been declared ineligible by the Council's clerk on the ground that he has received a housing subsidy and a loan on mortgage. The newly elected member has taken legal opinion, which conflicts with the clerk's opinion.

Sir Andrew Duncan, the head of the Electricity Board, during the past week started the machinery of the new generating station at Poplar, the first of the great power stations to be completed since the passing of the Electricity Act.

Excavations in the "Mob" Quadrangle at Merton College, Oxford, to locate the site of the old Church of St. John the Baptist, believed to have been erected in Saxon or Norman times, have revealed the existence of two sets of foundations under the north wing of the college, also, close by, the remains of a stone chamber of uncertain character and purpose.

A memorial stone to Titus Flavius Flavinus, centurion of the Sixth Legion, erected by order of his son Classicus Aprilis, has been discovered close to the North Road, at Clifton, York.

The late Mr. Delissa Joseph, F.R.I.B.A., who died on January 10, has left estate of the gross value of £32,606, with net personalty £25,925. On the death of his wife one-half of the residue of the estate, as she may appoint, is left to the Royal Institute of British Architects, for a bursary to enable students who have passed the qualifying examination to visit the United States of America for the study of architecture.

The Hall Mark of Your Craftsmanship

ANY Product that has—by its sheer merit—attained prominent distinction in the industries of to-day reflects the sincere craftsmanship of its makers in all things. Henceforth all further products of theirs are established upon the confidence that the first has won.

The position that the "Crabtree" Switch occupies to-day needs little comment. That the same lofty standards of sincere Craftsmanship are embodied in every "Crabtree" Accessory are only too apparent to all who have handled them.

Such Quality in detail is to be found in even the smallest Crabtree Accessory. Such care in detail that proves forethought in design and scrupulous accuracy of workmanship throughout.

"Craftsmen in
Electrical Switches."

For every Heating Installation IDEAL CLASSIC

The universal approval accorded to Ideal Classic Radiators is due to the many practical features embodied in their construction, including

High Efficiency,
Rapid Heating,
Small Space Occupied,
Strength and Reliability.

Their artistic design also makes them specially adapted for residential and other heating installations where appearance is an important consideration.

London Building Notes

BECONTREE.—The L.C.C. are to proceed with the erection of 2,221 houses on another section of the Becontree estate, at a cost of £1,270,000. This section will be developed by Messrs. C. J. Wills & Sons, Ltd., as a continuation of their existing contract.

BOW.—A ceremony in connection with the commencement of demolition work upon the site of the proposed Kingsley Hall in Powis Street, E.1, took place last week. The new building will include clubrooms, library, classrooms, etc., and will cost £12,000. The first foundation stone will be laid in July. The building has been designed by Mr. C. Cowles Voysey, A.R.I.B.A., 14 Gray's Inn Square, W.C.

BROCKLEY.—Twelve houses in Chudleigh Road, Brockley, are to be erected by Messrs. J. W. Heath & Sons.

CATFORD.—Plans passed by the L.C.C.: 46 garages, River View Park, for Mr. G. Furness.

EDMONTON.—The Empire Cinema Circuit, of Wardour Street, W.1, propose to pull down and rebuild, on a larger scale, the old Empire at Edmonton. Plans have been prepared which show a stone-fronted theatre with accommodation for 2,000 spectators, fitted with adjuncts such as lounge hall, restaurant, etc. The architect is Mr. Cecil Masey, 19 Devereux Court, Strand, W.C.2.

FOREST HILL.—Messrs. William Wilmot, Ltd., builders and contractors, are to erect eight houses in Forest Hill Road and Canobie Road, Forest Hill.

FULHAM.—Plans passed by the B.C.: Buildings for Macfarlane, Lang & Co., Townmead Road; for Messrs. Troy & Co., Buildings at Hammer-smith Distillery; Chancellor's Road, for Messrs. J. W. Faulkner & Sons.

HACKNEY.—Plans passed by the B.C.: 19 houses, Cazenove Road, for Mr. A. H. Jones; and a new building, Margaret Street, Stamford Hill, for Mr. G. Coles, F.R.I.B.A.

HAMPTON.—Princess Mary, Viscountess Lascelles, has consented to lay the foundation stone of the new parochial hall to be built at Hampton Wick by the local church council. As reported in THE ARCHITECT AND BUILDING NEWS on April 22, the contract for the building has just been placed with Messrs. Bernard & Bickett, Wallington, at £5,073. The architect is Mr. Jessop Hardwick, F.R.I.B.A., Eagle Chambers, Eden Street, Kingston-on-Thames.

HOUNSLOW.—A large estate in the vicinity of Kneller Hall at Whitton is to be developed for housing purposes, and lay-out plan has been approved which shows the erection of about 170 houses on 14 acres of land. A further estate in Alexander Road is to be laid out for over 100 residences. The architects are Messrs. P. Chase Gardener & Co., 269, High Street, Hounslow.

ISLINGTON.—The L.C.C. are to proceed with the development of the George's Road area, Islington. The

block, of normal type of accommodation, will comprise 110 tenements, containing 332 rooms, to afford accommodation for 664 persons; while the block of the simplified type will contain 24 tenements with 40 rooms, to accommodate 80 persons.

JERMYN STREET.—At last week's annual meeting of the Gordon Boys' Homes, held at the offices of the R.S.P.C.A. in Jermyn Street, S.W.1, the chairman, Sir Vesey J. Dawson, said that the freehold of the Homes has been purchased from the War Office, and that considerable improvements and additions would have to be made to the buildings to bring them up to modern requirements.

KENSINGTON.—At the meeting last week of the Select Committee of the House of Lords which is considering the Royal Albert Hall Bill, it was stated that the governors of the hall have to face an immediate expenditure of £15,000 upon the building to bring it within the requirements enforced by the L.C.C. regulations. The manager of the hall is Mr. C. B. Cochrane.

KENSINGTON.—The building of the second portion of the large Church of Christ, Scientist, in Wright's Lane, Kensington, W., is now in hand, the contractor being Mr. E. H. Burgess, 45 Berners Street, W.1, who completed the first portion of the building some time ago. The plans have been prepared by Mr. P. Phipps, 2 Boyle Street, W.2.

LEYTON.—It is proposed to erect a new public-house on a site on the south side of the High Street. The building owner is Mr. Frederick Grow, of the "Plough and Harrow" public-house, High Road, Leytonstone.

LEWISHAM.—Plans passed by the L.C.C.: 54 garages, Belmont Hill, for Mr. H. E. Kennard.

MARYLEBONE ROAD.—An appeal for £250,000 is being made by the governors of the Queen Charlotte's Maternity Hospital Training School in order to extend their buildings in Marylebone Road, N.W.1. It is proposed to double the present accommodation and to erect a new building with 73 beds, with increased quarters for nurses. The cost of the building and equipment is estimated at £130,000.

PARK LANE.—The recently published elevation of the flats to be built upon the site of Grosvenor House, in Park Lane, W., show two large blocks of flats, consisting of ten floors each, surmounted at each corner by a further storey. The façades will be in red brick and Portland stone, the bulk of the ground floors being devoted to shops, public restaurants, and other amenities. The architects are Messrs. Wimperis, Simpson & Guthrie, F.R.I.B.A., 61 South Molton Street, W.1, the consultant being Sir Edwin Lutyens, R.A., Queen Anne's Gate, S.W.1. The owners are the Grosvenor House, Ltd., and the building contractors and engineers are

Messrs. Edecasters, Ltd., Goldhawk Road, W.

PECKHAM.—The L.C.C. have passed plans for the proposed rebuilding of Nos. 138a, 140, 142 and 144 High Street, Peckham, for Messrs. Selfridge & Co., Ltd.

RACKHAM STREET.—It is proposed by the St. Marylebone B.C. to carry out various alterations and improvements to their buildings at Rackham Street, W.10, known as St. Marylebone Hospital. The work will be put in hand under the direction of the architects, Messrs. Constantine & Vernon, F. & A.R.I.B.A., 82 Mortimer Street, W.1.

SOMERS TOWN.—Four large blocks of working-class dwellings, comprising 88 flats in all, are to be erected upon an extensive site in Wolcot Street, Somers Town, N.W.1. Plans have been approved by the St. Pancras B.C., and quantities have been prepared by Messrs. Waggett & Bradford, Carlton Chambers, 12 Regent Street, W.1.

ST. JAMES' STREET.—The large premises known as No. 32a St. James Street, S.W.1, are to be pulled down and a block of modern buildings erected on the same site, to the plan of Sir Henry Tanner, F.R.I.B.A. Hanover Square, W.1. The owners of the property are Sandow's Curative Institute, Ltd.

ST. JOHN'S WOOD.—A large corner site, with an area of 160,000 square feet, is shortly to be sold for building purposes. It is stated that a block of residential flats may be erected. The surveyors are Messrs. Goddard Smith, 22 King Street, St. James's, S.W.1.

STREATHAM.—Mr. S. L. Gowlland to construct 20 garages and convert house into flats on the site of 50 Leigham Court Road, Streatham.

SYDENHAM.—Plans passed by the L.C.C.: 20 garages, corner of Charles Street and Sydenham Hill Road, for Mr. R. P. Kennedy.

WANDSWORTH.—A factory is to be erected at The Baulk, Merton Road, Wandsworth, by Messrs. G. Mason & Co., Ltd.

The Week's Building News

The following abbreviations are used: U.D.C. for Urban District Council; T.C. for Town Council; R.D.C. for Rural District Council; E.C. for Education Committee; B.G. for Board of Guardians; P.C. for Parish Council; B.C. for Borough Council; M.H. for Ministry of Health; M.T. for Ministry of Transport; C.B. for County Borough; B.E. for Board of Education. Direct confirmation should be obtained before commitments, for which we cannot be responsible, are made.

ASHFORD.—It is proposed to build a large new Catholic church for the parish, at a cost of about £20,000. The plans have been prepared by Sir Giles Gilbert Scott, R.A., Gray's Inn Square, W.C.

BOLTON.—Messrs. Bradshaw, Gass & Hope, F.F.R.I.B.A., 19 Silverwell Street, Bolton, have now completed the revised plans for the erection of new police buildings and court house at Bolton.

BRADFORD.—The City Architect is to prepare plans for the erection of a pavilion at Thornton Grammar School at a cost of about £1,000.

BRADFORD.—The Corporation Libraries Committee have approved plans, prepared by the City Architect, for the conversion to the open access system of the lending department at the Central Library, at an estimated cost of £3,620.

BRISTOL.—The Corporation Housing Committee have approved the erection of a further 142 houses on the site at Rodney Road. They also recommend the erection of 200 houses on the Shirehampton site, at an estimated cost of £86,000.

BURY.—Mr. C. R. Cooper, L.R.I.B.A., 20 Market Street, Bury, has prepared the plans for new classrooms at the Bury Grammar School.

EASTBOURNE.—Plans have been prepared by Messrs. Tatchell & Wilson, architects, for new masters' and butlers' quarters at Eastbourne College.

ELTHAM.—Plans passed by the L.C.C.: 18 houses, Green Lane, for Mr. G. T. Scudamore; 23 houses, Footscray Road, for Mr. W. Childs; 10 houses, Footscray Road, for Mr. S. Browne; 21 houses, Cadwallon Road, for Mr. J. G. Francombe.

FALMOUTH.—Falmouth new hospital. It is proposed to erect a building with 40 beds, at an estimated cost of £12,000. Mr. Wheatley, Truro, is the architect.

FRASERBURGH.—The Fraserburgh T.C. is considering a scheme for the erection of new gas works, at an inclusive estimated cost of £20,000.

GRAYS.—A new pavilion ward is to be built at the hospital in Stifford Long Lane, for the Board of the Grays and Orsett Joint Hospital. Plans have been prepared by Mr. Christopher M. Shiner, "The Barn," Dell Road, Grays, under whose supervision the work will be shortly put in hand.

HYDE.—The Hyde Hippodrome is to be extended. The plans are being prepared by Messrs. Dee & Ingham, architects and surveyors, Market Chambers, Market Square, Hyde, Cheshire. The contract has not yet been placed.

INCE.—The E.C. have approved plans for the erection of a new school at Higher Ince to accommodate 720 pupils. Messrs. W. C. Ralph & Son, architects, 8 King Street, Wigan, have prepared the scheme.

MANCHESTER.—Fifteen houses are to be erected by Mr. J. D. Scott, builders, Chorlton-cum-Hardy, at the corner of Highfield Road and Hackness Road. Mr. E. W. Taylor, of Barlow Moor, Chorlton-cum-Hardy, is the architect.

MANCHESTER.—Messrs. Rylands & Sons, Ltd., New High Street, Manchester, are proposing to erect a new warehouse in Bridgewater Place, Manchester. The architects are Messrs. Adshead, Topham & Adshead, F.F.R.I.B.A., 14 St. Annes Square, Manchester.

MANCHESTER.—Mr. B. Waterhouse, F.M.S.A., Resident Architect to Messrs. Threfalls Brewery Co., Ltd., Cook Street, Salford, has prepared the plans for the extension of the Crown and Anchor Hotel, Cateaton Street, Manchester.

MANCHESTER.—The City Architect has prepared plans for the erection of a motor bus garage in Queen's Road, the cost being estimated at £20,000.

MARYLEBONE.—The B.C.'s architects, Messrs. Ashley & Newman, have submitted three preliminary draft plans showing the lay-out of the area to be included in the Carlisle Street improvement scheme. The blocks of flats will be of the five-storey type. The committee have approved the design, which is so arranged as to utilise part of the existing sewers and other services, which will mean a considerable saving in expenditure.

NOTTINGHAM.—The Notts E.C. have now approved the sketch plans for a permanent school for 232 upper standard scholars, to be erected on the new site to be purchased at Skegby. Mr. L. Maggs, Shire Hall, Nottingham, is the county architect. The estimated cost is £16,200.

PLYMOUTH.—Mr. W. G. Gingell is to erect a Badminton Hall and seven garages in Eggbuckland Road, Plymouth.

PLYMOUTH.—The Corporation are to proceed with the completion of the Burrator reservoir, at an estimated cost of £30,000.

RETTFORD.—Mr. Cyril Getliffe has prepared plans for a new theatre, to be known as the New Majestic Theatre, in Coronation Street, Retford.

ROCHFORD.—A contract has just been placed for the erection of a large block of buildings at the Rochford Institution for the treatment of senile dementia cases, at a cost of £23,541. The contractors are Messrs. R. Niblett & Co., Chiswick, W., who will commence operations at once. The plans have been prepared by Mr. Norman Evans, architect, Westcliff-on-Sea.

SALFORD.—The District Bank, Ltd., are proposing to make structural alterations and additions to their branch premises at 257 and 259 Chapel Street, Salford. Messrs. Francis Jones & H. A. Dalrymple, F. & A.R.I.B.A., 178 Oxford Road, Manchester, are the architects.

SCARBOROUGH.—House and shop to be erected at Edge Hill Park, Scar-

borough. Mr. David Petch, 6 Westborough, Scarborough, is the architect.

SHEFFIELD.—Messrs. Peacock Bewley, F.F.R.I.B.A., 83 Colmore Row, Birmingham, are the architects for a scheme for the erection of the new Church of St. Albans, for the Rev. L. B. Heppenstall and the congregation. The Estates Committee of the C.C. have agreed to sell a freehold plot of land on the Manor Estate to the Wesleyan Methodist Church for the erection of a new edifice. Plans for the building, which will accommodate 500 persons, have been prepared by Mr. W. J. Hale, F.R.I.B.A., 13 St. James Row, Sheffield.

SHEFFIELD.—The Corporation have approved the City Architects' revised lay-out plan, showing 50 bungalows and 122 parlour type houses on the Ridgeway Road estate.

SHEFFIELD.—The Corporation have asked the City Architect to prepare plans and estimates for the erection of conveniences at Middlewood tram terminus, Attercliffe Road, Main Road, Darnall, Woodthorpe Arms, Intake, junction of Clarkehouse Road and Glossop Road, and near junction of Neepsend Lane and Rutland Road.

SHEFFIELD.—The Corporation have voted an estimate of £83,000 for the erection of 172 houses on the Ridgeway Road Housing Estate.

STANLEY.—Extensions are to be carried out at St. Andrew's Church. The plans have been prepared by Messrs. Wood & Oakley, of 4 Cloth Market, Newcastle-on-Tyne. It is proposed to extend the church 14 ft. to the east and to erect a new tower.

STOCKPORT.—Messrs. Eaton, Sons & Cantrell, architects and surveyors, Stamford Street, Ashton-under-Lyne, are the architects for the alterations to Horsfield Arms, Bredbury.

STRATFORD-ON-AVON.—Mr. Guy Pemberton is the architect for the extensions to be made to the General Hospital, which are estimated to cost £4,000.

WALTHAMSTOW.—The Warner Estate, Ltd., have entered into a contract for the erection of 400 houses on their Town Planning Estate. The builders are the Law Land Building Dept., Ltd., Norfolk Street, Strand.

WIMBORNE.—A site has been acquired by the Catholic congregation for the erection of a new church. Mr. W. S. Walters, F.S. Antq., 28 Great Ormonde Street, London, W.C., has been appointed architect for the scheme.

WINTERTON.—The Durham County Architect has prepared plans for a new erection on the site of the old infirmary ward at Winterton, which will provide 50 beds, with day-room, space, at an estimated cost of £8,000.

WITHINGTON.—Extensive alterations are to be made to the Talbot Hotel, Apauldeth Road and Ladybarn Lane. Mr. B. Waterhouse, F.M.S.A., is the architect.

REINFORCED CONCRETE ENGINEERS

The Kahn System

An interior of the factory for Wrigley Products, Ltd., at North Wembley, showing mushroom slab construction.

Architects: Wallis Gilbert & Partners.

Contractors: A. Roberts & Co., Ltd.

Reinforced Concrete Engineers: The Trussed Concrete Steel Co., Ltd.

The advantages of mushroom construction for factories.

The illustration on this page shows a typical mushroom construction. The advantages of this system over a beam and slab construction are: the complete elimination of depending beams, resulting in a flat ceiling throughout the building with no obstruction to light or air: the absence of any columns in the external walls greatly facilitates the placing of internal fixtures beneath the windows: one hundred per cent. glass area can be obtained, giving the maximum lighting and ventilation: it is more economical than any other form of construction for large areas.

This system is most suited to modern methods of rapid construction—the bays are all of standard size and the centering can be repeated in any part of the building.

**The essence of the design and construction
of mushroom slab buildings is experience.**

BETONAC gives Strength to Concrete

SAND is the weak component in concrete, it absorbs moisture and disintegrates; it crumbles and makes dust.

Betonac, the new metallic aggregate, makes concrete with the strength and durability of steel, impervious to moisture and practically dustless. Betonac is graded to produce every type of non-skid surface, from rough to dead smooth. Lay Betonac wherever durability is essential. Samples, prices and National Physical Laboratory Report on request.

BETONAC STEEL CONCRETE

FRANCOIS CEMENTATION COMPANY, LTD.

Betonac Department, 5 Bentley Works, Doncaster.

To withstand the pounding of lorries and the abrasions of millions of tyres, the cement used for making roads must have a high crushing resistance. This quality Kaye's Portland Cement possesses in an unusual degree. For the same reason it is unexcelled for ferro-concrete constructions.

H & C WROUGHT STEEL VENTILATORS

YEARs of experience in the manufacture of Ventilators made from Wrought Steel have resulted in many and important improvements being effected, chief of which is increased capacity for the free transmission of air.

We have reduced the area of fretwork obstruction and thereby largely increased the size of openings in our Ventilator faces, with added strength.

The air capacity of H. & C. faces will be supplied on request, together with sizes of Ventilators stocked. Made of heavy gauge steel to ensure rigidity and durability. Of all Ironmongers and Builders' Merchants.

BUILDING WAGE GRADES

Grade Classification	A	A1	A2	A3	B	B1	B2	B3	C	C1
Standard Rates	1/8	1/7½	1/7	1/6½	1/6	1/5½	1/5	1/4½	1/4	1/3½
Labourers' Rates	1/3½	1/2¾	1/2½	1/2	1/1¾	1/1½	1/1	1/0½	1/0½	-/11½

The following are the gradings of towns in England and Wales. The rates quoted apply to all craftsmen, with the exception of those marked with an asterisk, which denotes that there is a differentiation in the rate paid to painters, details of which are given separately at foot. The London rates are :—Within a 12 mile radius from Charing Cross—all craftsmen (excluding painters), 1s. 9½d.; painters, 1s. 8½d.; labourers, 1s. 4½d. From 12 to 15 mile radius, all craftsmen (excluding painters), 1s. 9d.; painters, 1s. 8d.; labourers, 1s. 4d.

THIS IS AN ABRIDGED LIST; THE GRADINGS OF OTHER TOWNS MAY BE HAD ON APPLICATION TO THE EDITORIAL OFFICE OF THIS PAPER.

A CENTRAL BUREAU FOR THE BUILDING TRADES

A difficulty which is experienced by every architect is that of finding time and opportunity to become acquainted with the innumerable materials and manufactured articles which are available in the building trade, but which, in many cases, have either never claimed attention, or have been overlooked in the pressure of daily business.

It may at once be objected that there exists to overcome this difficulty more than one excellent buyer's guide and catalogue of the building trade, in addition to the private catalogue service which practically every firm maintains, and that at the service of the architect there is an ever ready army of travellers ready to sally forth, and with a few deft explanations, turn darkness into light. There remain, however, certain fundamental difficulties.

In the first place, catalogues and information are difficult to file, although no doubt this detail of office administration is capable of satisfactory handling. In the second place, the architect has not always leisure to see the traveller, and in any case it is not always practicable for the representative of a manufacturing firm to carry with him a wide range of samples.

In the past this difficulty has been met by a manufacturers' bureau, centrally situated, where showroom space was given to the products of various firms, and where the architect could compare the various commodities on the market. Most architects will recall the offices in Bloomsbury which existed before the War for this purpose, and which performed a function which, if extended, might have developed into an extremely valuable information service for the profession and the building trade.

That particular enterprise has not, we believe, survived the depression of the war period, but the question of re-creating such a service has been sometimes mooted, more especially by Mr. C. F. A. Voysey, who, some years ago, prepared a fully detailed scheme for an "R.I.B.A. Museum," which was to exist for the purpose of encouraging improvement in manufactured articles, to provide a permanent sample room and a centre where all information could be obtained regarding products, prices, and the names of manufacturers.

This scheme, which contained the outline of a complete office organisation, would have been of immense help to all concerned in building, not to mention the architectural student, but it did not overcome (if memory serves aright) the difficulty of adequate financial support which the architectural profession, and at least the R.I.B.A., would scarcely be in a position to supply.

The truth is that such a Bureau, whatever may be its title, must be the child of the building trade and not of the architects, for it is the members of the former (be it said without irony), who have the necessary resources. More than that, while the Bureau would constitute a great convenience to the architects, for the manufacturer it would prove a salesman. There seems, in fact, no reason why such a Bureau could not readily be organised in London and function well, provided manufacturers would consider the pooling of resources, and a reconsideration of present methods of distributing samples and information. In organising this central show-room the promoters would have at their disposal the experience of pioneers in a similar enterprise in New York, where for some fifteen years at least there has been in existence the so-called Architects' Bureau, housed in a splendid modern building in a central and convenient location.

The New York Architects' Bureau is maintained entirely at the expense of the manufacturers. It has shown itself to be a commercially profitable venture, and it has increased in size until it occupies to-day more than three times the space with which it started its career.

The office of the Bureau is not a selling organisation; it merely gives out information and passes on enquiries. Its showrooms are a permanent exhibition, but not a shop.

The keynote of the scheme is the information office in which is tabulated information, including catalogues, of every conceivable product or material, and where an obliging staff is ready to answer any question which concerns the personnel of either the architectural profession or the building trades. Here is an Enquiry Bureau, in fact, where one may bring one's queries and puzzling problems, instead of

having to fall back on hopes of information through one's favourite paper or one's architect acquaintances. The staff of the Architects' Bureau are paid to answer questions, and are glad to do so, for information leads to business, and the Bureau lives by business.

Apart from the information counter, the library of catalogues and periodicals, the Bureau consists of a spacious and cleverly organised Showroom, in which every inch of space in floor, wall and ceiling, performs its function of display.

In one section of the building are shown mechanical equipment, boilers, radiators, stoves, heaters and the like, exhibits of bulk which require a large space; while on the other side are materials and manufactured products of all kinds from bricks and stones to the smallest fittings and accessories.

Each sub-section is arranged with studied care; trays, drawers, and swinging screens, every device which can save space and secure a fair display is utilised to show the goods, and such arrangements as those for showing panels of brickwork, always a

difficult subject to exhibit in a confined space, are admirable.

Apart from isolated units, there are a few completely fitted rooms, to which various firms have contributed their own special items of equipment. The Bureau, however, covers too wide a field to permit of much display on specially built-up back-grounds.

The architect pays nothing towards the Bureau. He goes to it to make enquiries and inspect samples. If, as a result of visiting the Bureau, he approaches some manufacturer, he is asked to mention the Bureau as the source of information. That is the Bureau's payment for its service.

If in New York such an organisation is a successful and profitable enterprise, there seems no reason why in England this convenience could not also be instituted. There is a movement now on foot to attempt to reduce the cost of building; perhaps the Architects' Bureau, with its principle of pooled resources, might actually help a little towards this end.

Notes and Comments

The Structural Engineers

If the dinners of the Institution of Structural Engineers have a social rather than a professional note, that fact seems to be warmly appreciated by the large gatherings of members and their friends which Captain Kiddy, the indefatigable secretary, contrives to get together on these occasions. There is much to be said for relaxation from "shop" at these annual gatherings; and while, at last Monday's function, the President, Mr. H. J. Deane, could boast the presence of Lord Carson, as principal guest and speaker, and the personal support of his brother presidents of the Institutions of Civil, Mechanical and Electrical Engineers, and of the Surveyors' Institution, the speeches rarely diverged into serious technical matters. It will probably be news to some that Lord Carson started life as an engineer under his father's tutelage, but relinquished, at the parental behest, his own inclination towards construction for the building-up of cases in law. Nor would one seriously doubt his humorous assertion that, had he followed his own desires, he would have made "the finest constructional engineer of them all." Mainly his reply to the toast of "Our Country and Empire" centred in a tribute to the "constructional" contribution to this cause of Major Waters, V.C., D.S.O., M.C., who proposed the toast in the modest manner that might be expected from a great engineer-soldier. Mr. Palmer, the President of the Institution of Civil Engineers, replying for "The Guests," apologised for the past opposition of his society on certain matters connected with the development of the Host-Institution; an opposition conceived, he asserted, in the best interests of the structural engineers, and of engineering as a whole. The point-blank opposition of his Institution to the Architects' Registration Bill, to which he also alluded, seemed, from his remarks, to be less concerned with the welfare of architecture than the preservation of "vested interests." At a somewhat late stage of the proceedings, Mr. Deane essayed to tell us something about the Institution over which he so ably presides, but defective acoustics or loud-speaker arrangements contrived to make much of his speech inaudible. A well-deserved tribute to the

Institution's secretary "came over," however; as well as a statement that, during the past year, the membership had increased by nearly a thousand, to a strength of approximately 3,500. That seems the most significant and promising stage at which to end a note of this successful evening.

Obituary

Mr. G. H. Felowes Prynne

We regret to announce the death of Mr. George Halford Felowes Prynne, F.R.I.B.A., which occurred rather suddenly at his Ealing home on May 7. Mr. Prynne, who was 74, was the second son of the Rev. C. Rundle Prynne, vicar of St. Peter's, Plymouth, and was educated at Chard College and Haileybury. He went to Canada in 1871 ostensibly to learn farming, but soon after entered the office of Mr. R. C. Windyer, architect, of Toronto, and subsequently became a pupil of G. E. Street, R.A., studying also at the R.A. schools. His practice was mainly confined to ecclesiastical work, and one of his first commissions was the rebuilding of his father's church at Plymouth. Among other of his churches are All Saints', West Dulwich, St. Peters, Budleigh Salterton, St. Saviour's, Ealing, Holy Trinity, Roehampton, All Saints', Elland, St. John's, Sidecup, St. Paul's, Westham, St. Peter's, Ilfracombe, All Saints', Sydenham, St. Peter's, Whitstable, St. Martin's, Worcester, Holy Trinity, Exmouth, St. Wilfred's, Bognor, St. Alban's, Bournemouth, St. Mark's, Purley, St. Peter's, Bushey Heath, St. Peter's, Harrow, St. Nicholas', Taplow, St. John the Baptist, Horrabridge, St. Michael's, Beaconsfield, and Umtata Cathedral, South Africa. His design for Colombo Cathedral, Ceylon, accepted before the war, has yet to be carried out. The distinguishing characteristic of his work was his great love of strong colour. He was President of the A.A. in 1899-1900, Oxford Diocesan architect since 1913, and one of the Committee of Honorary Consulting Architects to the Church Building Society, besides being a member of the London Diocesan Conference. He leaves a widow and five children, two of his five sons having fallen in the War.

THE TROWBRIDGE COMPETITION: FIRST PREMIATED DESIGN.
MESSRS. F. J. LANDER, A.R.I.B.A., and E. A. D. TANNER, A.R.I.B.A., Architects.

THE TROWBRIDGE COMPETITION

Messrs. Cyril Farey and Robert Lowry, who acted as assessors in the competition for the proposed new offices for the Wiltshire Working Men's Conservative Benefit Society at Trowbridge, have announced their award. The first premiated design is that of Messrs. F. J. Lander & E. A. D. Tanner, who have presented a thoroughly workmanlike scheme. The building, which is intended to house the officials of a Benefit Society, marks another stage in the growth of the modern movement in planning that finds its expression in the tendency to regard the interior of a building as so much cubical space, to be divided up into sections devoid of the dignity attaching to individual rooms; for the sub-units of the plan in these new structures are not intended to be constant, but are bounded by walls of a light and temporary nature, which are capable of being shifted about to the convenience of the occupier of the premises. This system has, of course, the advantage of mobility and is, moreover, economical, inasmuch as the problem of lighting is facilitated by the glazed partition walls, which enable considerable areas to be built over without the necessity of interior courts. And where a large number of clerks belonging to one business concern are assembled in a single building, the task of supervision is facilitated when the structural divisions between the apartments occupied by them are as slight as possible.

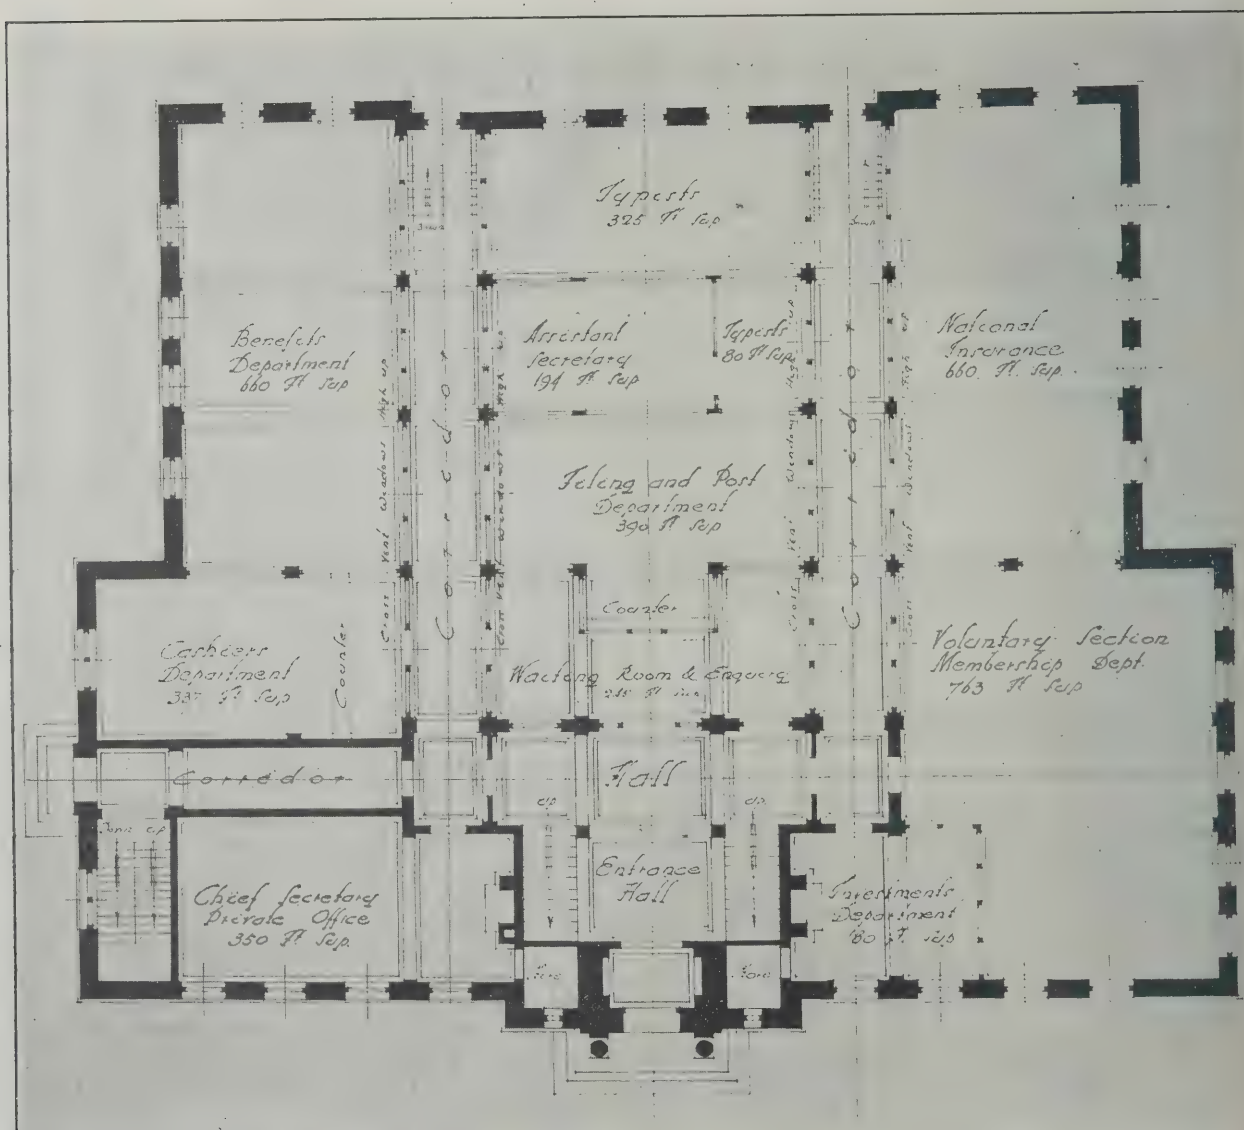

In the present instance the large main office with accommodation for 50 clerks was the principal element in the plan, the other chambers of importance (although not comparable with the former in size) being the board room, offices for the chief secretary and assistant secretary, cashier, and committee room. In addition, caretaker's quarters and the usual lavatory accommodation for men and women were to be provided. The winning design shows a logical treatment in which the entrance hall is flanked on either

side by rooms for the chief secretary and the cashier respectively, while beyond is the public counter space with staircases right and left. The main office shows how the departments for membership, benefits, National Insurance, investments, filing and post, the voluntary section and the typists' quarters can be conveniently arranged in a pattern which nevertheless has pleasing elements of formality. On the first floor the stairs give access to men's and women's lavatories, the committee room, all on the street frontage, while behind, occupying the central third of the space above the main office, is a handsome board room. It will be observed that this arrangement has the great advantage of enabling the greater part of the main office to be top-lit. The elevation, with its formal pattern dominated by the entrance portico set in the middle of a symmetrical arrangement of windows, is satisfying as a composition, but perhaps appears to be too domesticated in character.

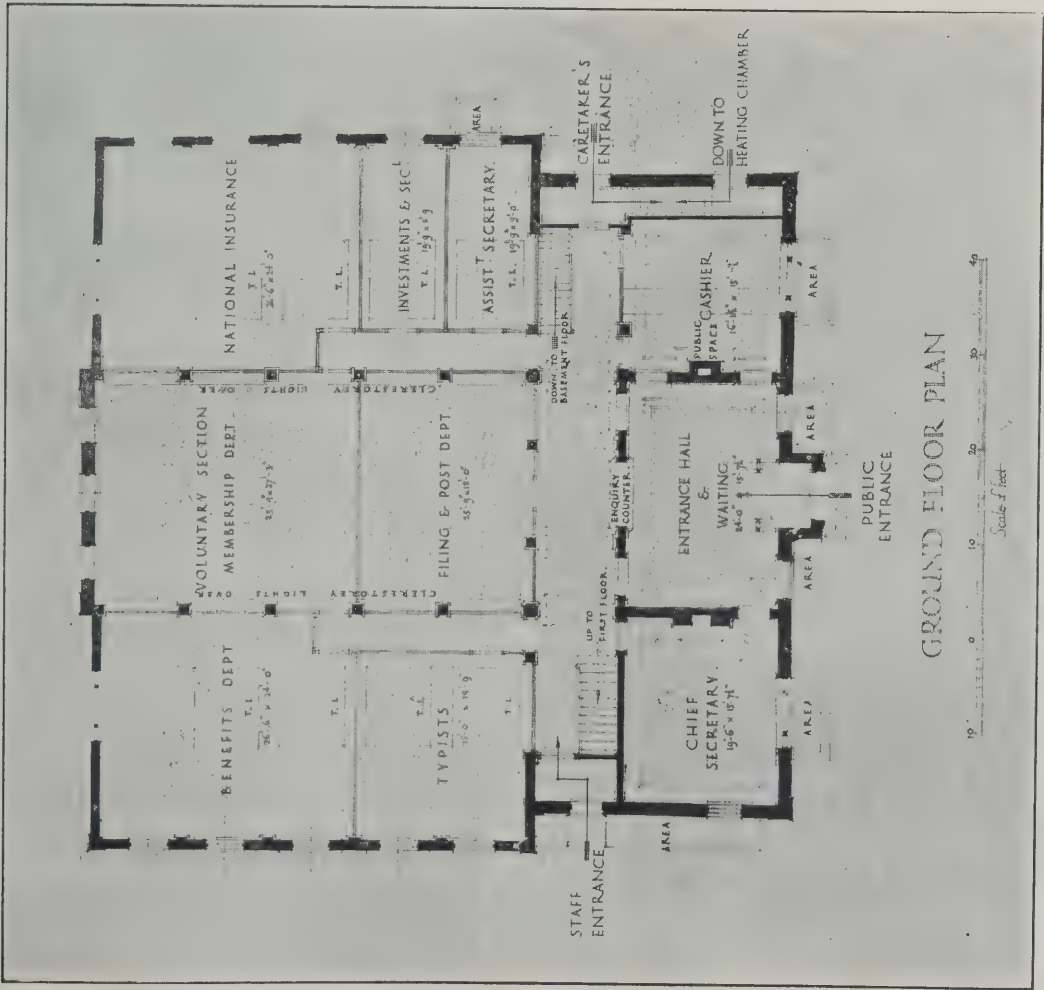

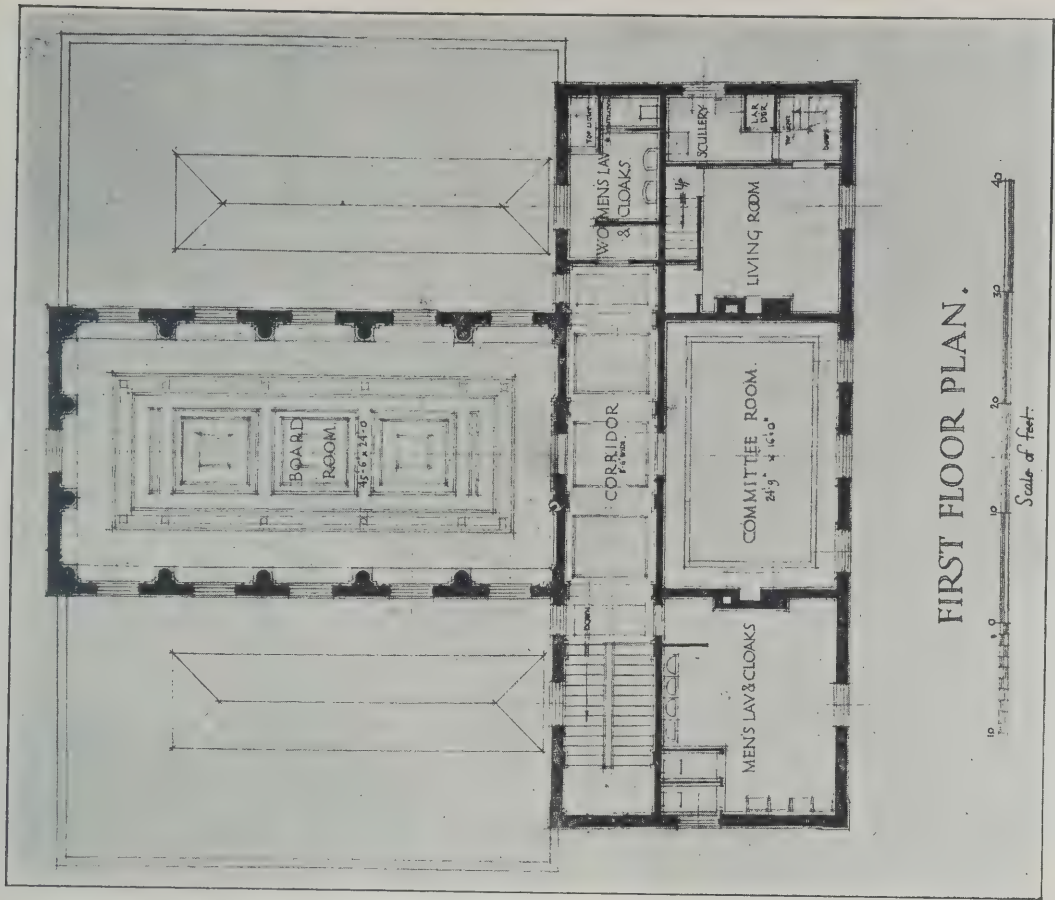

The design placed second, by Messrs. C. T. Bates and C. L. Jones, also shows a convenient plan, in which, however, the principle of throwing all the area into a single space but lightly sub-divided is carried even further than in the winning design. The elevation suffers from the defect that the central projection, with its prominent doorway and hipped roof, is too narrow a feature to dominate over the façade, which thus appears to be uncomfortably divided into two, while the tall chimneys also produce a somewhat restless effect.

The third premiated design, by Mr. A. B. Llewelyn Roberts, is the most formal of the three, and represents a bold attempt to group the offices in sectors around a semi-circle. The arrangement, although it produces an attractive pattern on paper, does not lend itself so well to economical disposal of the cubical capacity of the building.

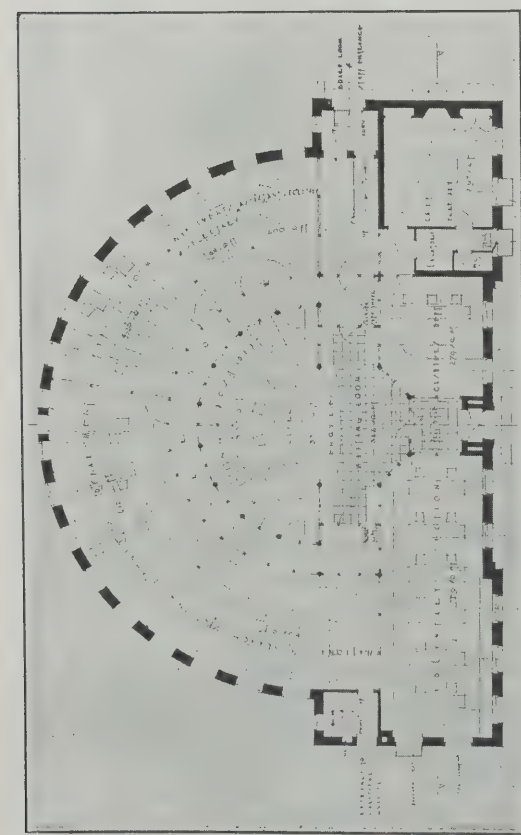

The drawings will be on view at Holy Trinity Church Hall, Newtown, Trowbridge, from 10.30 a.m. to 12.30 p.m. and 2 to 4 p.m. till Saturday, May 21.

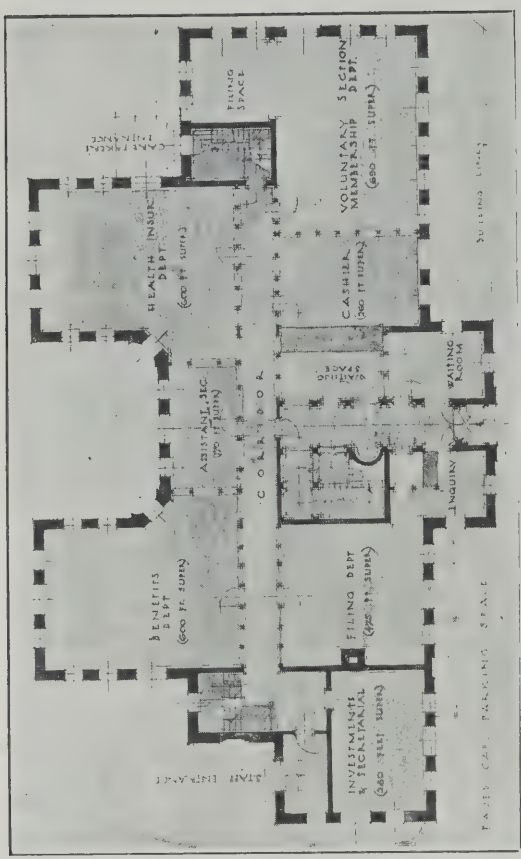

THE TROWBRIDGE COMPETITION: SECOND PREMIATED DESIGN.
MESSRS C. F. BATES A.R.I.B.A., and C. L. JONES, L.R.I.B.A., Architects.

ON MARQUISES

Some Recent Examples in London

There was a time, not long distant, when architects, apparently, mistrusted and disliked the marquee. It was, and is, difficult to design one so as to look as if it could have belonged to the 16th, 17th or 18th century, and it was felt that there was something frivolous and ignoble about a metal and glass structure projecting from a solid Portland stone front without visible means of support. But, as no one could deny the practical advantages of a shelter, it seemed best to leave it to the building owner to put one up for himself after the building was finished, thus leaving the architect without a stain on his character. For reasons such as these the epoch of brighter marquees did not arrive in London till a few—a very few—years ago. To-day, however, the opportunity of incorporating a marquee in a new building, or adding one to an old building, is regarded by architects with pleasure, and scarcely a month passes by without a new one appearing. Buildings which are conscious of being a little behind the times welcome the opportunity of smartening themselves up round their doorway, and a marquee has the advantage of being practical as well as decorative.

It will not be imagined by anyone who knows the L.C.C. that that body will allow such things to protrude from buildings without comment. The watchful old lady of Westminster Bridge is the first person that the architect called in to design one must placate, and it is more than possible that he will have his ideas severely pruned at the outset. He must leave a gap of at least 2 ft. between the edge of his shelter and that of the pavement, and the depth of his shelter from cresting to vallance must not exceed 2 ft., no matter how high above the pavement he may go. Strangely enough, however, a marquee which

curves upwards to follow the arch of a doorway may exceed these limits—a concession for which one must be grateful, since it allows of one of the most vigorous and attractive types familiar to everyone who knows Paris, and charmingly exemplified in the one at the Ambassadors' Club entrance, designed by Messrs. Allison and Durand. It may be added that all metal and glass shelters are regarded by the L.C.C. as temporary structures which are licenced only for a period, and for which a renewal of the licence must be applied for from time to time.

Another practical point to be considered is the disposal of rain-water, and this can be a very troublesome and expensive business, for your modest 1½-in. drainpipe cannot simply discharge on to the pavement, but must conscientiously find its way to the nearest drain.

Finally, the method of fixing has to be considered. Most marquees are cantilever structures, and the size of the steelwork which the L.C.C. will regard as adequate will be considerable. It is fortunate if a sizeable girder is found conveniently placed for bolting to, for it frequently happens that the steelwork of shelters placed between columns has to be taken some distance back into the building, and in such a case considerable ingenuity may be required to avoid spoiling the interior.

Marquees range in type from those which completely expose their construction to those which completely conceal it. The new shelter at the Monico Restaurant is an example of the former, and those at the New Gallery Cinema and at Simpson's Restaurant in the Strand of the latter. Generally speaking, the question of whether artificial light is or is not meant to play a large part in the design will

decide that point, for it is obviously much easier to arrange the lighting in a shallow box than it is under a single thickness of glass. It is, however, easy to underestimate the amount of lighting required to produce an effective display at night. The shelter at the

new Criterion Restaurant in Regent Street (Sir Reginald Blomfield and Mr. Wm. Woodward) suffers in this respect; the lights concealed between the two layers of glass produce a patchy and uneven effect. On the other hand, that at the New Gallery Cinema

seems over-lit. At all events the innumerable small, exposed lamps give a somewhat confused effect. A very effective feature can be made of a lamp hung under the shelter but designed as part of it, as in the Simpson's Restaurant example.

The marquee provides an excellent opportunity for the skilful choice and handling of materials, and wrought iron, bronze, enamel, glass, gilding and paint comprise a palette adequate to the wants of any designer. Messrs. Collett & Hamp have made very successful use of gilded bronze and enamel in their fan-shaped shelter at the Holborn Restaurant, which was erected some two years ago. Rich in colour and material, also, is that over Marshall & Snelgrove's entrance, but the effect is slightly finicky. It is very English-looking, however, which most marquees are not, and it is an admirable piece of workmanship. The New Gallery Cinema marquee, by Messrs. Nicholas and Dixon Spain, previously referred to, is also cased in bronze, but it does not seem to gain in richness thereby, and the ornament is so small in scale that it scarcely counts. Just off Regent Street, at the Brook Street entrance to Verrey's Restaurant, however, we strike one with a very definite character of its own. It has a light and perhaps slightly prickly Neo-Grec character, but it is pleasantly in accordance with the architecture of the building (by Messrs. Yates, Cook & Darbyshire). Both the one at the Monico Restaurant and the one at the Æolian Hall in Bond Street, by Mr. Young, provide sound examples of circular shelters in which radiating glazing bars play a considerable part, though unfortunately the latter is not quite at home under the ornate pediment of the doorway in which it has been inserted.

Marquees are not often found in domestic work, but there is to be found in Brook Street a very attractive little one.

The examples illustrated here show how varied the treatment of the marquee can be, and at the same time how many attractive possibilities in design remain to be worked out. The patterns that can be made by glazing bars—curved, radiating or tilted upwards—crossed by their supporting cantilever, are innumerable. The gaiety and suavity of curved shapes can be made to give admirable expression to a place

of entertainment, as witness the Ambassadors' Club marquee, and a high-class shop can suggest the quality of its goods by the perfection of workmanship and materials, as in the case of Marshall & Snelgrove's shelter. What is of paramount importance is that the materials should be "the best of their respective kinds." Cheap bronze is not to be compared with good wrought iron, and lack of fresh paint and cleaned glass will spoil the effect of any design.

Notes in Brief

The Central Electricity Board for Great Britain has taken offices at Trafalgar Buildings, Charing Cross, London, W.C.2. Mr. Archibald Page, Vice-President of the Institution of Electrical Engineers, has been appointed Chief Engineer to the Board.

The Minister of Health visited Wandsworth last week to attend the meeting arranged to celebrate the completion of the thousandth house erected by the Housing Committee of the Wandsworth Borough Council.

The dispute between the contractors and the authorities has, apparently, so far been settled that three sections of the new Kingston by-pass road will be opened to traffic before the Easter holidays. The opening of the other sections involves the construction of three bridges, and cannot be completed before the autumn.

A memorial stone to Titus Flavius Flavinus, centurion of the Sixth Legion, erected by order of his son Classicus Aprilis, has been discovered close to the North Road, at Clifton, York.

Competition Result

The Rawmarsh and Parkgate War Memorial Competition.—*First Premium:* C. H. Hutton, A.R.I.B.A., Bolton. *Second Premium:* Vernon Constable, A.R.I.B.A., Dundee. *Third Premium:* Ernest G. Theakston, F.R.I.B.A., London. The cost of the Memorial, inclusive of the fees, was not to exceed £2,000.

New Ways and Means

*The Editor will welcome early information of
New Plant, Materials and Fittings*

A New Type of Concrete Piling

Concrete piling which can be inspected after driving has been introduced by Messrs. West's Rotinoff Piling and Construction Co., Ltd., of Regent House, Kingsway, London, W.C.2. This piling is built up *in situ* from precast reinforced concrete shells provided with a helical groove on the inner face for taking the force of impact, which is transmitted from corresponding helical projections on a steel mandrel used in the driving operation. In this way the driving force can be evenly distributed over the whole length of the helical groove, with the ultimate effect equivalent to a series of small forces acting directly upon mere segments of the shell immediately below them. The shells, 13½ inches external diameter and

New "Set" Ramming Machine.
(Aktiebolaget Srenska Gatumaskiner.)

operations in diagrammatic form. On the left a pile is in course of being driven and the workman is putting another pair of sections in position on the mandrel; in the centre, the pile has been driven to the required set and the mandrel has been unscrewed from the shell; whilst on the right the concrete core is being poured in. The driving of the mandrel is effected by a 2-ton hammer falling through a distance of 3 feet; the unscrewing is carried out by means of a 40 h.p. electric motor, working through reduction

West's Rotinoff Concrete Pile: Reinforced and Concreted.
(West's Rotinoff Piling and Construction Co. Ltd.)

26 inches long, are made in half sections so that they can be placed on the mandrel as the driving proceeds. In driving the pile a precast concrete shoe is placed in position on the ground and the mandrel is lowered on to it. The first pair of half shells are then placed on the mandrel and wired together, and the mandrel is driven into the ground, taking the shell with it, "driving" being discontinued when the shell projects slightly above the level of the ground. Additional shell sections are put on as the work proceeds, until the required "set" is obtained. The mandrel is then unscrewed from the shells, which remain undisturbed in the ground, giving a protected hole in which the concrete core can be cast. The latter is generally reinforced to a depth of 6 to 8 feet from the ground level, the reinforcement bars being allowed to project into the concrete cap which surmounts the assemblage, but should it be advisable to put reinforcement throughout the whole length of the pile this can be done without difficulty. Our composite illustration shows these

West's Rotinoff Concrete Pile: Driving Operations.
(West's Rotinoff Piling and Construction Co. Ltd.)

gears. The appearance of the hole after removing the mandrel, and the finished pile (reinforced and concreted) is shown in two other illustrations. The chief advantage of this new system of piling lies in the fact that there can be absolute certainty as to the shape and form of the resultant pile, which will be of uniform section throughout its whole length, whether the ground through which it has been driven is hard or soft. The resulting piles may therefore be loaded to their fullest capacity with safety. The concreting being a separate operation, piles can be driven close together with great speed. The final set, corresponding to the original compression of the soil, is also maintained, as the rotation of the mandrel and the filling-in of the core does not disturb the compressed soil surrounding the shells.

West's Rotinoff Concrete Pile: After removal of Mandrel.
(West's Rotinoff Piling and Construction Co. Ltd.)

A New Road-making Machine

Our illustration shows a new machine for laying granite sets, introduced by Messrs. Aktiebolaget Srenska Gatumaskiner, of 5, Grevmagnigatan, Stockholm. This machine, which is driven by a 2-h.p. petrol engine, can be made to knock down 220 square feet of paving per hour, working upon carefully laid bedding of tar macadam. In practice the stroke of the hammer can be regulated up to a maximum of about 15 inches, with 60 strokes per minute. The weight of the hammer is about 150 lbs., but this weight can be increased or reduced by adding or removing loose lead from the interior. The machine can be moved about by its own power, so that it keeps pace with the speed at which the sets are being laid down. Taking into consideration the height of the stroke at the weight of the hammer, it should be able to produce four times the amount of work normally carried out by a man working with the usual tool for ramming down "sets."

A UNIQUE OFFICE BUILDING

The Home of the American Radiator Company in New York

RAYMOND HOOD, Architect.

By HOWARD ROBERTSON.

The black and gold tower which Raymond Hood has designed as the headquarters of the American Radiator Company in New York is one of the most interesting buildings in America.

In the first place it is a bold experiment in colour, and represents not only an extraordinarily ingenious and legitimate means of advertising the company which financed its erection, but also an interesting attempt to blend together solids of wall and voids of window in a general uniformity of tone. In the second place, the Radiator Building makes a definite contribution towards progress in the handling of form in skyscraper design, breaking away, as it does, from the usual method of treating a tall building in three divisions of base, shaft, and cornice. And, lastly, the planning of the various floors reveals the utmost ingenuity and the reduction to a minimum of that space which must in a building of this nature be regretfully conceded to services and structural elements.

The dominant impression which will be carried away by the visitor to the Radiator Building is undoubtedly that arising from the strange effect, in a city of light or neutral toned buildings, of this shaft of black rising with a quick upward sweep to break at its summit into a series of clustered stalagmites tipped with gold. The sharp and sudden contrast is all the more accentuated through the proximity of the low, white marbled bulk of Carrère and Hastings's New York Public Library, in the square behind which the American Radiator Building stands.

It was hoped—and the hopes have been very largely justified—that the use of a black material for the main mass of the building would overcome the tendency of the innumerable office windows to break up the surface of the walls into a monotonous pattern. If it had been possible to build in a black material of polished surface, there is no doubt that solid and void would have been very nearly merged. As it is, with the walls constructed

of a dark red brick which has been twice burned to reach as deep a pitch of blackness as the double firing can give, there is far greater simplicity and strength to the lower bulk than were the windows framed by the usual wall surface of grey or buff.

The goldwork is used with discretion, and the quality of its brilliance is increased towards the top. It is laid chiefly on to the terra-cotta which forms the dressings, and is carried out in gold leaf as being the only material which would give the right tone and

which would withstand the weather. There are, of course, at close range slight signs of wear in the gilding, but from the street the effect is rich without a trace of shabbiness. In strong sunlight, and in the night-time illuminations by flood-lighting of the summit from the various terraces which the zoning of the silhouette has created, the blending of black and gold is extremely dramatic. The idea arose in Mr. Hood's mind after a visit to Brussels, in which was specially noticed the rich effect of the regilding of the detail on the tall fronts of the houses in the Grande Place. The gilding in the Radiator Building cost about £5,000 to execute, but in advertising value it has been worth to the company a sum very much in excess of that.

The base of the building, which comprises showroom space, is faced with polished black granite with a lacquered brass finish to the metal surrounds to the doors and windows. These are well handled, and draped with deep valances and curtains in cream and blue, behind which are flood lights illuminating the window display.

The planning of the ground floor shows great ingenuity, and arises very largely from the special nature of the American Radiator Company's business.

Obviously, the display of boilers and the equipment of heating generally cannot be carried out effectively in the ordinary showroom manner, as to do so would be to divorce these fittings from their function and to render them far less interesting than they

might appear if shown in their natural surroundings.

Basing his layout on the assumption that the heating generators in nearly every type of building are placed in the basement storey, Mr. Hood has designed the Radiator Company's showroom as a vast staircase leading down on to broad landings—large enough to constitute show space at two intermediate levels—to a kind of magnificently decorated cellar in which stand, resplendent in a coat of rich lacquer-red enamel, the actual boilers which are doing the work of heating the whole building.

There could be no more dramatic and effective method of display than this. Here are shown, in a setting prepared with every artifice of expectation and climax, splendid specimens of the mechanism which the company supplies, and they are shown under the most convincing conditions, those of actual working.

The approach to the lower boiler-room is as cleverly handled as the idea is ingenious in conception. The staircase from the ground floor showroom is less a flight of stairs than a descending showroom. Its vaulted roof is decorated in gold, blue and red on a cream ground, enriched with mural paintings by C. D. Fall, and its walls are lined with a dado of heavy black slates. On the landing are displayed one or two examples of radiators, and in the showroom at the foot are further exhibits, though great discretion is exercised in not overcrowding the floor space with too many specimens. From this vaulted showroom yet another broad flight of stairs leads down to the boiler-room, which is separated from the showroom only by a rich iron grille.

Behind the boilers is a chamber into which pass all the boiler flues and all pipes and connections, so that to the public is visible only the smooth red surface of the boilers themselves. Every pipe is painted

in a special colour to denote its function and designation, and on the wall of the boiler-room is framed a keyboard on which the colours are identified. In a layout of this kind, where the piping and ducts become a network of confusion, the idea of painting the pipes for identification is of a very practical value.

Quite apart from the effectiveness as display space of these descending levels, culminating in the vaulted boiler room, there is a distinct practical advantage in the differences of level, as by sinking their own space below ground level the proprietors of the building gain an extra lettable showroom at street level, immediately over the boiler room. As the building is planned, there is a showroom to the left of the entrance vestibule, with the staircase leading to the lower showroom and boiler room, while on the right is a very large showroom on ascending levels, which is leased to another firm. No doubt it is only the special nature of their products which enables the American Radiator Company's own showrooms to be effectively planned with only a minimum of frontage occupied, but Mr. Hood has grasped these possibilities without hesitation, and developed this ingenious disposition of levels with a sure hand; not only has he provided original and effective settings for his clients' own specialised products, but he has contrived to reserve a very considerable space on the street level of this very valuable and restricted site for the purposes of revenue production (the reader will find that the plans showing the various levels repay close examination).

The plans of the upper floors of the building are a model of compactness. Mr. Hood has made a special study of the very important problem of organising the services of a tall building into the most economically planned and reduced area of space. In the arrangement of the service section of the Radiator

SHOWROOM LEVEL.
RAYMOND HOOD, Architect.

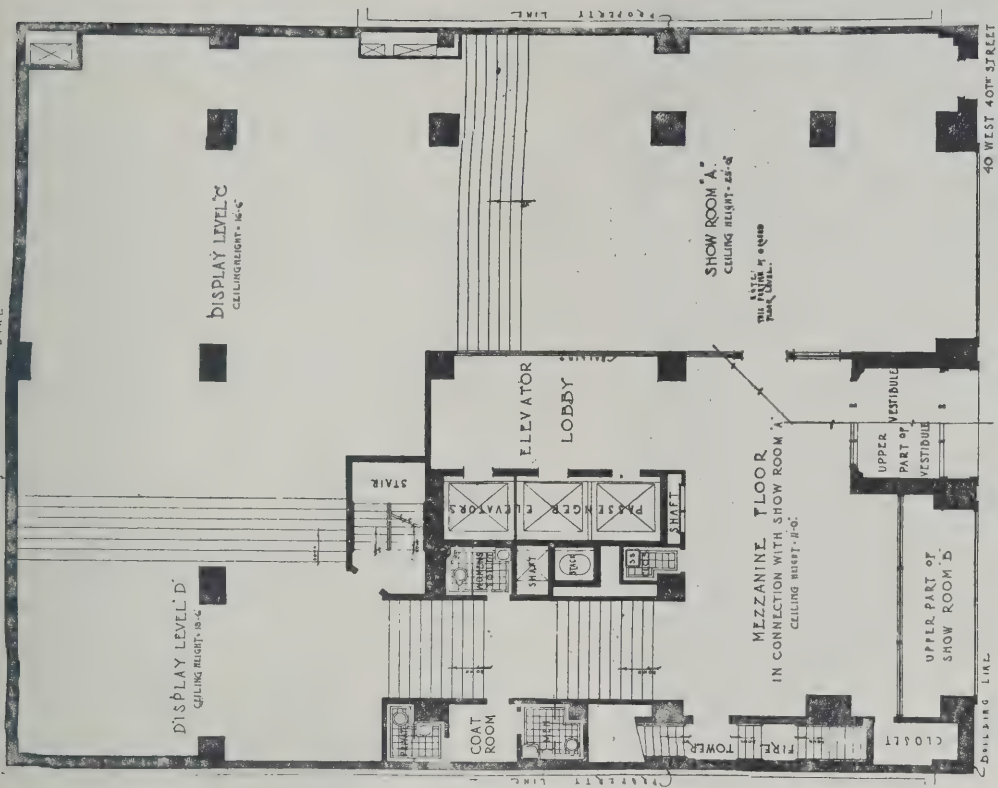

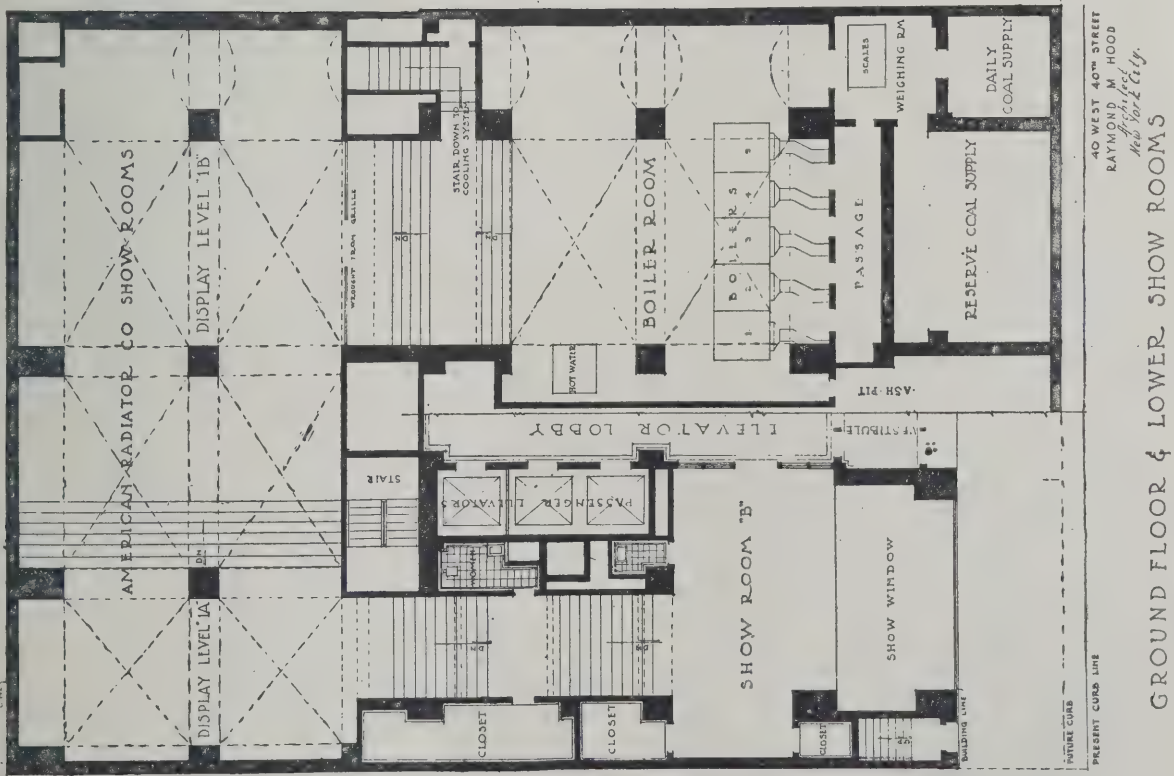

[Photo: Clark]

Building, including lifts, staircases, toilets and ducts, it is believed that there is not an inch of space which is not utilised to full value.

The amount of lift service required has been carefully calculated, bearing in mind the two requirements which are the bane of skyscraper design, the necessity for rapid vertical communications and the reduction to a minimum of all space which is not revenue producing. Bearing in mind that the upper storeys of the building would be utilised by offices of the Radiator Company of a more private and administrative

character, the main service of three express elevators is taken up to the 16th storey, after which there is a shuttle service to the remaining floors, which are, of course, reduced in area as the building is zoned back in successive stages.

The work of designing and erecting this building was carried out in the incredibly short time of thirteen months from the date of acquiring the site. Pressure of haste was so great that the steel frame had to be designed and ordered within a month, while the design of the façade was only settled two months later.

AT STREET LEVEL TO THE LOWER DISPLAY LEVELS
AND BOILER-ROOM.
RAYMOND HOOD, Architect.

Mr. Hood has, too, evolved his own methods of study, and in the designing of a building of this kind uses models almost exclusively. The whole of the design of the Radiator Building was first completed in the form of a very carefully detailed model, and it was from this model that the working drawings were prepared.

One of the finest architectural effects of New York by night is the illumination of the Radiator tower from the terraces of the offsets above the 16th storey. The treatment of black and gold is brought out in its full value, and the clear, assertive vigour which marks the building by day is transmuted into a vision of soft brilliance, in which is revealed more strongly than at any other time the essential difference of quality between the design of this building, with its vertical shaft-like unity, and the previously accepted form of skyscraper designed in horizontal sections which inevitably recalled a series of boxes pierced with windows.

Mr. Hood's design in every way represents a departure from convention. His plan is the outcome of vision combined with hard study in the working out of its details; as an engineering feat, the necessity of keeping the floor space free from stanchions, of supporting the upper tower portion (which requires in the 22nd floor a pair of beams over 90 ft. long), and of establishing an exceptionally deep foundation into the solid New York rock (one of the foundation piles is 120 ft. deep!), have raised problems which in any case are difficult, but which are doubly so when speed of design is such an essential factor. It is only to be hoped that others, commercially inclined and less able than the designer of the Radiator Building, will elude the pitfalls of imitation.

Book Reviews

Planning a Home. By a Layman and his Wife. (Arrowsmith). 5s. net.

This little manual, intended for the instruction of laymen with regard to the planning of a home, is brightly written, and its authors evidently take an enthusiastic interest in domestic architecture of the small "villa" type which they assume to be the right kind of abode for members of "that great middle class which forms the backbone of England." The "jacket" of the book informs us that an architect says: "This is an excellent book. But it should not be published, for it tells all our secrets and makes architects unnecessary." So the first impulse of an architectural reviewer is, figuratively speaking, to tear the book to pieces—until he reads the dedicatory page, in which the authors have inscribed the words, "To architects, members of a conscientious, hardworking, and not over-remunerated profession, greetings and respectful homage." Thus "A Layman and his Wife" are diplomatists of no mean order!

Such books as these often have a wide circulation, and it is of interest to speculate what is their effect upon architectural design in general and upon the professional welfare of architects in particular. There can scarcely be any doubt that a volume such as the present one, which contains about a dozen very neatly drawn plans and discussions upon subjects of such popular interest as "Labour Saving," "Lighting and Heating," "Plumbing and Hot Water," "The Week-end Nest," "Sunshine Cottage," "A House with Angle Bays," "A Two-maid House"—to name some of the titles to the chapters—is sure to persuade many prospective builders of small houses that with the information here given they are quite competent to draw up little plans themselves and dispense with professional services. Such books, therefore, however small may be their scope, are deserving of careful consideration by architectural critics, who, while welcoming such useful suggestions as laymen may offer, should yet, with all courtesy, point out in what respects the amateur house plans appear defective.

In the present instance the authors are not afraid to dogmatise upon much debated architectural questions, and it is refreshing to come upon such a frank plea on behalf of the flat roof. Perhaps their argument will carry greater weight when all houses are electrically heated and chimneys can be dispensed with, and when flat roofs which really keep out the rain can be very cheaply constructed. The authors write pleasantly on such subjects as grass paths, hedges, manures, the advantages of built-in furniture, noiseless water-closets, sunlight in the breakfast-room, gold-coloured paint, "mirrors judiciously spaced in creating the illusion of greater space," and inverted Georgian candlesticks as electroliers. We learn that "as a general rule oblong panes are to be preferred, and the oblong most pleasing to the eye is that in which the longer side of the oblong is the length of the diagonal of the square of the shorter side. Beds should be placed north and south, as the magnetic currents of the earth take a north and south direction and the body is not distressed if lying in conformity with this magnetic flow."

Two plans shown by the authors have obvious faults. In the "week-end nest" the stairs have too many windows, the sitting-room fireplace lies between two doors, as is also the case in "the sunshine cottage." In the "house with angle bays" we have again a breakneck stairs, the kitchen is dark; in the other rooms the windows are badly placed. And the authors do not seem to be aware that in a bedroom containing a double bed, wall space must be provided for not less than two wardrobes. The task of reconciling these plans with tolerable elevations has not been tackled, and would indeed present many difficulties.

HAPPINESS

is born of content and is nowhere to be found so much as in one's own home; it is not to be picked in other people's gardens. A warm red roof makes an irresistible appeal to workers returning from their daily work. Content is natural wealth and it is within your power to make life brighter for many people, by giving your houses cheery roofs — by specifying Courtrai-Du Nord Tiles to be obtained from

The COURTRAI-DU NORD TILE Co. Ltd.

ARCHITECTS' REGISTRATION BILL

Proceedings of the Select Committee

WESTMINSTER.

The Select Committee which was appointed by the House of Commons to consider the Architects' Registration Bill held its first public sitting last week, under the chairmanship of Sir Clement Kinloch-Cooke, M.P., when evidence was submitted by Major Harry Barnes, who is President of the Registration Committee of the Royal Institute of British Architects.

Major Barnes stated, at the outset, that he was authorised by the Institute to say that, in accordance with the undertaking given on their behalf during the second reading of the Bill in the House of Commons, they were prepared to qualify the term "architect" as it appeared in the Bill. It was only natural that they should do so with considerable reluctance. Words such as "authorised," "recognised," and "statutory" had been suggested by members of the Institute, but they came to the conclusion that it was impossible to find any word to which less objection could be taken than "registered." The use of the word "registered" as a qualification would appear to remove all opposition to the Bill, and would have the effect of changing the register from a compulsory to a voluntary one. As the Bill stood, persons were considered to be registered who were entitled to be registered, and that might have the effect of putting on the register persons who did not desire to be put on. It was, therefore, proposed that persons desiring to be put on the register should have to make application, so that no one would be put on against his will. The adoption of the term "registered architect" would remove the fear expressed on behalf of local authorities that the Bill would interfere with their officials; it would remove the apprehension of the civil engineers that they would not be allowed to use freely and unrestrictedly the term architect in connection with their work; and it would also remove the apprehensions of the Co-operative Societies that, by placing a restriction on the use of the word "architect," the Bill would interfere with certain departments of their work. A number of amendments consequential on the adoption of the term "registered architect" had become necessary. In addition to these, the Institute had prepared other amendments for the consideration of the Committee.

Referring to other amendments proposed by the Institute, Major Barnes said it was felt that, as registration was not to be compulsory, a fee might be charged. The disciplinary powers provided under the Bill would, of course, only apply to members on the register. In connection with the constitution of the Board of Architectural Education, provided for in the first schedule to the Bill, it was proposed that, instead of three representatives being nominated by the National Association of Art Masters, two should be nominated by the Association of Technical Institutions and one by the National Association of Art Masters. The Faculty of Architects and Surveyors and the National Federation of Building Trades Operatives were to be added to the Board.

Major Barnes then went on to explain the part taken by the Institute in drawing up the Bill. The Council of the Institute, he pointed out, were entrusted with setting up the register. The Admission Committee would control the entrance of all men at present in practice, assistants and students. The Board of Architectural Education would control those who might become students after the passing of the Act. The Discipline Committee would control removal from the register. In framing the Bill, regard had been

had to the fact that there were men at present in practice who were members of bodies other than the Institute, and steps had been taken to ensure that the admission of such persons should be as free and open as in the case of any other person. The Admission Committee was, therefore, made up of representatives of every body from whose representatives admission was likely to be sought.

Replying to a member of the Committee who asked if there was to be any representative of the Workers Educational Association, Major Barnes said that was not at present provided for in the Bill. Reference had been made to that body during the second reading debate, and it would be entirely in keeping with the views of the Institute if such a representative were appointed. The machinery for the removal of members from the register, he continued, was set up on the principles followed in other professions. It was proposed to safeguard the position of everyone on the register by making the Discipline Committee contain not only a number of his peers, but also persons entirely apart from the profession. There would be three registered persons and two others, one appointed by the Minister of Health (who might be regarded as a representative of the general body of citizens), and the other appointed by the President of the Law Society (who might be regarded as a representative to see that the case had a proper hearing). In conclusion, Major Barnes explained to the Committee the constitution of the Institute and the precedents existing in other professions for placing registration in the hands of such a body as was proposed.

Mr. Tasker asked whether the Institute on one occasion instructed learned counsel in connection with a Bill where the use of ferro-concrete was involved? Major Barnes said that the Institute acted together with other bodies on that occasion, and succeeded in getting a substantial concession in the matter.

The Chairman suggested that these matters did not affect the Bill under discussion, and that Mr. Tasker was not entitled during the course of examining the witness to attack the Institute. Mr. Tasker said the Bill was designed to exclude civil engineers and other professions from carrying out architectural work, and that in their interests he must put questions as to the attitude of the Institute towards them.

After some further discussion between members of the Committee as to whether it was desirable that questions relating to the detailed work of the Scientific Committee of the Institute should be addressed to the witness, it was finally agreed that the points which Mr. Tasker wished to raise should be handed to Major Barnes in writing, and an opportunity given at a later sitting for the considered answers to be discussed.

Major Barnes: As far as the Bill is concerned, it is not the Bill that will do that, but the undertakers. (Laughter.) The present generation, you might roughly say, are not affected by the Bill. It is more for the benefit of future generations.

Replying to Captain Wallace, M.P., who is also a member of the Select Committee, Major Barnes said that although the Institute would prefer the word "chartered" to "registered," he did not think the former could be put in the Bill, because there would be the difficulty of persons who were members of the Institute having the right to be called "chartered" by reason of their membership of the Institute, which held a charter, and at the same time prevented from calling themselves "chartered" by reason of the Bill.

The Committee adjourned until this week.

**Beautify your Wood
with
SOLIGNUM**

If a Columbian Pine Door is painted or covered with a cheap stain it ceases to be "A Thing of Beauty," but, stained with Solignum, it remains "A joy for ever."

Solignum improves with age. It does not scratch or show fingermarks; and, to quote the words of a prominent user, "It is the most perfect and economical stain for indoor work ever introduced."

Dry rot and decay cannot exist where Solignum is used.

BUILDING WAGE GRADES

Grade Classification	A	A1	A2	A3	B	B1	B2	B3	C	C1
Standard Rates	1/8	1/7½	1/7	1/6½	1/6	1/5½	1/5	1/4½	1/4	1/3½
Labourers' Rates	1/3½	1/2¾	1/2½	1/2	1/1½	1/1½	1/1	1/0½	1/0½	~1/11

The following are the gradings of towns in England and Wales. The rates quoted apply to all craftsmen, with the exception of those marked with an asterisk, which denotes that there is a differentiation in the rate paid to painters, details of which are given separately at foot. The London rates are :—Within a 12 mile radius from Charing Cross—all craftsmen (excluding painters), 1s. 9½d. ; painters 1s. 8½d. ; labourers, 1s. 4½d. From 12 to 15 mile radius, all craftsmen (excluding painters), 1s. 9d. ; painters, 1s. 8d. ; labourers, 1s. 4d.

THIS IS AN ABRIDGED LIST; THE GRADINGS OF OTHER TOWNS MAY BE HAD ON APPLICATION TO THE EDITORIAL OFFICE OF THIS PAPER

'PUDLO'

BRAND

CEMENT WATERPROOFER

THE absorption of rain and grime—inevitable when cement is not waterproofed—has reduced to dreary dulness, many cemented façades that once gave pleasure to the architects and craftsmen who produced them.

The whitest and brightest cement quickly becomes dingy unless it is waterproofed. When 'PUDLO' Brand waterproofer is added, the work retains its bright, stone-like appearance, and is not damaged by frost after rain.

Specifications for weatherproof stucco and roughcast are in the Handbook of Cement Waterproofing—post free.

Used for Reservoirs, Damp Walls and Floors, Flooded Cellars, Leaking Tanks, Polluted Wells, Garage Pits, etc.

KERNER-GREENWOOD & CO., LTD., ANN'S FORT, KING'S LYNN.

Sole Proprietors and Manufacturers.

The word 'PUDLO' is the registered Trade Brand of Kerner-Greenwood & Co., Ltd., by whom all articles bearing that Brand are manufactured or guaranteed.

The Development of an Ideal in Craftsmanship

SHIPS and Switches—there seems but little relation between them except in the progress of their Craftsmanship—for as the Science of Navigation is marked milestone-wise by the development of types of craft—so is the progress of Electricity measured by the development of types of accessories designed to meet the requirements of to-day—and, if necessary, those of to-morrow.

* * *

Ships or Switches—in whichever Craftsmanship finds expression, there survives a type that symbolises the highest Craftsmanship of its age—a type that, based upon the ripened experience of yesterday, adequately fulfils the need of to-day and aims at the requirements of to-morrow.

The Week's Building News

The following abbreviations are used: U.D.C. for Urban District Council; T.C. for Town Council; R.D.C. for Rural District Council; E.C. for Education Committee; B.G. for Board of Guardians; P.C. for Parish Council; B.C. for Borough Council; M.H. for Ministry of Health; M.T. for Ministry of Transport; C.B. for County Borough; B.E. for Board of Education. Direct confirmation should be obtained before commitments, for which we cannot be responsible, are made.

BIDDULPH.—The U.D.C. are to erect 50 houses on the Station Road site at an estimated cost of £21,500. The architect is Mr. S. Gilson, surveyor, Public Hall, Biddulph.

BIRKENHEAD.—New elementary schools are to be erected at Cole Street at an estimated cost of £20,286. The architect is T. T. Rees, Esq., F.R.I.B.A., 64 Rodney Street, Liverpool.

BIRMINGHAM.—The B.G. are to erect a new single-storey nurses' home at Monyhull Colony, King's Heath. Plans have been prepared by C. Whitwell & Son, 3 Newhall Street, Birmingham. No contracts have yet been placed.

CARLISLE.—On behalf of the trustees, Mr. H. E. Ayris, L.R.I.B.A., of 68 Lowther Street, Carlisle, has prepared plans for extensions at the Central Hall, Market Street, Carlisle.

CHELMSFORD.—The Essex C.C. are to erect additional county offices at Duke Street, Chelmsford, to cost £91,000. Plans are being prepared by the County Architect.

CHESTERFIELD.—A church is to be erected in the parish of St. Augustine's, Chesterfield, Derby. The architect is Mr. Leslie T. Moore, F.R.I.B.A., 18 Church Row, Hampstead, London, N.W.3.

DERBY.—The Derbyshire Hospital for Women are erecting a new hospital for women in Friargate, Derby. The architects are Messrs. Naylor, Sale & Moore, LL&F.R.I.B.A., Market Place, Derby.

DUNDEE.—The B.C. are to make extensions to the Ashludid Sanatorium, estimated to cost £40,000. The architect is Mr. James Thomson, F.R.I.B.A., City Architect, Commercial Street, Dundee.

ECCLES.—The Manchester and District Co-operative Laundries Association, Ltd., are making additions to their buildings in Lansdowne Road, Eccles. The contractors are The Building Department, C.W.S., Broughton Lane, Manchester. The architect is Mr. A. H. Walsingham, 62 Market Street, Manchester.

GORSEINON.—A new hospital is to be erected at Gorseinon, Swansea, at an estimated cost of £20,000. The architect is Glendenning Moxham, Esq., F.R.I.B.A., 18 Castle Street, Swansea.

HASTINGS.—The R.D.C. have passed plans for the reconstruction of the Cutter Hotel and cottage, East Parade, for Mr. J. H. Howard, architect; business premises, 1 York Buildings, for Messrs. Callow & Callow, architects; eight garages, Church Road, Hollington, two houses, Woodland Vale, St. Leonard's, and workshops, Bexhill Road, St. Leonard's, for Mr. H. M. Jeffery, architect.

HASTINGS.—Plans have been prepared by Messrs. H. Ward & Son, L.R.I.B.A., for the erection of an entertainments hall at Gordon House,

Carlisle Villas, Hastings, and for the erection of a lecture room, Buchanan Hospital, Springfield Road, Hastings.

HAYES.—The Gramophone Co., Ltd., are to make large extensions to their factory at Hayes at a cost of £207,000. The architects are Messrs. Wallis, Gilbert & Partners, FF.R.I.B.A., 29 Roland Gardens, S. Kensington, S.W.7.

ILKLEY.—A cinema, café, and dance hall are to be erected in Ilkley. The architects are Messrs. Chadwick, Watson & Co., 9 Albion Street, Leeds.

INVERNESS.—The Northern Infirmary, Inverness, is to be reconstructed and extended at an estimated cost of £100,000. The architect is Sir John James Burnet, R.A., LL.D.

LIVERPOOL.—The Liverpool Hospital for Women, Shaw Street, and the Samaritan Hospital for Women, Upper Parliament Street, are jointly to establish a new, up-to-date Hospital for Women at the junction of Falkner Street and Bedford Street, Liverpool, at an estimated total cost of £120,000. The architects are Messrs. Edmund Kirby & Sons, F.R.I.B.A., 5 Cook Street, Liverpool. Tenders have not yet been invited, and no contracts are placed.

MANCHESTER.—The C.B.C. have let the contract for erecting a sanatorium for children at Plas Uchaf, estimated to cost £225,000. The contractor is Thomas Lumsden, Newcastle-on-Tyne. The architect is Mr. Henry Price, A.R.I.B.A., City Architect, Town Hall, Manchester.

MANCHESTER.—The Sunday Schools of the Independent Methodist Church, Bradford, Manchester, are to be extended. The contractors are Messrs. S. Cookson & Son, Salford, and the architect is Mr. P. Howard, A.R.I.B.A., 88 Mosley Street, Manchester.

MANCHESTER.—Twelve houses are to be erected for the Fortrees Building Co., Ltd., on a site at Filbre Road and Milwain Road, Levenshulme. The architects are Messrs. Leech & Radcliffe, 7 Cheapside, Manchester.

MANCHESTER.—The Ideal Billiards (Salford), Ltd., Moston Lane, Manchester, are to erect a new billiards hall on a site at the junction of Cheetham Hill Road and Queen's Road, Cheetham, Manchester. The contractors are Messrs. S. Megarity & Co., Wellington Street, West Manchester, and the architects are Messrs. Matley, Brotherton & Mills, 11a Old Millgate, Market Place, Manchester.

MANCHESTER.—Messrs. Clifford Whatmough, Ltd., 16 Vesta Street, Ancoats, Manchester, are to erect a new factory in Vesta Street. The architect is Mr. W. A. Banks, A.R.I.B.A., 76 Wellington Road South, Stockport.

MANCHESTER.—Messrs. Jackson Bros., brass founders, Lord Street, Miles Platting, Manchester, are to extend their works. The contractor is

Mr. J. B. Russell, 62, Sandal Street, Bradford Road, Ancoats, Manchester, and the architect is Mr. H. H. Allen Estate Office, Bury Old Road, Prestwich, Manchester.

MANCHESTER.—Messrs. Wilson's Brewery Co., Ltd., are extending their works at Emmett Street, Miles Platting, Manchester. The architects are Messrs. W. Johnson & Sons, 27 Oldham Road, Miles Platting, Manchester.

MANCHESTER.—The C.B.C. have approved the following plans: Alterations and additions to premises of Hugh Fay & Co., 231 Stockport Road, and Delamen Avenue, Levenshulme; architects, A. Broeklehurst & Co., L.R.I.B.A., Palatine Bank Buildings, 10 Norfolk Street, Manchester. Twenty houses, Arthur Street, Wildcroft Avenue and Tyndal Avenue, Moston; architect, Mr. J. E. Kewell, L.R.I.B.A., 290 Oxford Road, Manchester. Additions to premises of Daily Express Co., Luna Street, Ancoats; architects, J. H. Andrews & Butterworth, L.R.I.B.A., Somerset Buildings, 19 Brazenose Street, Manchester, New Church Sunday School and Parish Hall, Loyd Street, South and Hart Road, Withington; architects, Messrs. T. Worthington & Sons, V.P.&A.R.I.B.A., 178 Oxford Road, Manchester. One hundred and nine houses in Chorlton-cum-Hardy for J. Lane & Son; architect, Mr. George Westcott.

MANCHESTER.—Princess Mary laid the foundation stone on Saturday for the nurses' home to be erected in Park Place for the Manchester Royal Infirmary, at an estimated cost of £150,000. The architects are Messrs. T. Worthington & Sons, V.P.&A.R.I.B.A., 178 Oxford Road, Manchester.

MANCHESTER.—The C.B.C. have approved additions to the Sunday School in Princess Street and Sloane Street. Architect, Mr. P. Howard, A.R.I.B.A., 88 Mosley Street, Manchester.

MERTHYR.—A cinema is to be built on the site of the Castle Hotel, High Street, Merthyr. The architect is O. P. Bevan, Esq., Bargoed, Glamorgan.

NEW MALDEN.—The Surrey E.C. are to make a £1,200 extension to the New Malden West County School. The architects are Mr. A. W. Jarvis, A.R.I.B.A., and Mr. F. A. Richards, F.R.I.B.A., 60 Tufton Street, Westminster, S.W.1.

NEWPORT.—The Corporation have decided to acquire a site near the centre of the town to build a new Town Hall and Law Courts, at an estimated cost of £500,000.

PANAMA.—A large number of ferro-concrete buildings are to be erected in the city. The British Vice-Consul suggests that British firms interested in the supply of materials used in this class of construction should for-

THE TRUSCON FLOOR

Reinforced Concrete

The New Bakery of Macfarlane, Lang & Co., Ltd., Tollcross, Glasgow.

An illustration of the ground-floor of the flour store.

Architect: Ernest Monro, A.R.I.B.A., I.A. (J. M. Monro & Son). Contractors: John Train & Co., Ltd.

TRUSCON FLOORS WERE CONSTRUCTED THROUGHOUT.

It is the primary duty of a floor to carry efficiently the loads which may come upon it. Of the other duties of a floor the least spectacular but the most useful is that of accommodating the "domestic services." The Truscon floor will do this.

Most buildings require gas and electric light, electric bells, telephones and water supply. Heating systems, either radiator or "panel," have to be allowed for, and sprinklers or ventilating systems are often required. The Truscon floor has an accessible hollow space in which all these services can be effectually concealed.

The Truscon Floor Book, containing illustrations and detailed information, will be forwarded on application.

THE TRUSSED CONCRETE STEEL CO. LTD.

REINFORCED CONCRETE ENGINEERS

22 Cranley Gardens, South Kensington, S.W.7

ward four sets of particulars, catalogues, prices, etc., to His Britannic Majesty's Consul-General, British Consulate General, Panama City, which the Consulate will distribute advantageously. The construction of a \$16,000 bath house by a local firm, and the erection of a first-class modern hotel in ferro-concrete, to cost over \$50,000, also offers opportunity for British materials, and particulars of these undertakings may be obtained from the Department of Overseas Trade, 35 Old Queen Street, London, S.W.1.

PRESTON.—A new school-chapel is to be erected at Ribbleson, near Preston, at an estimated cost of £9,000. The architects are Messrs. Mercer & Duckworth, A.R.I.B.A., New Dock Chambers, 162 Dock Street, Fleetwood.

PORTMADOC.—The U.D.C. have approved plans submitted by Mr. G. Morris, architect, for a dairy farmstead, including farmhouse, stables, cowshed, dairy, and haysheds, for Mr. Griffith Jones, of Ormond Terrace, Portmadoc.

SOUTHPORT.—Messrs. Lloyds Bank, Ltd., are to erect a new branch on a site at Churchdown, Southport. The architects are Messrs. George E. Tonge, L.R.I.B.A., Somerset Buildings, Hill Street, Southport, and Mr. Felix Holt, A.R.I.B.A., 14 Dale Street, Liverpool.

SPALDING.—The National Provincial Bank, Ltd., are to extend their premises at Spalding. The contractors are Messrs. Henry Rands & Son, Ltd., Elm Street, Wisbech, Cambs. The architect is Mr. F. C. R. Palmer, F.R.I.B.A., Resident Architect, National Provincial Bank, 15 Bishops-gate, E.C.

STRETTFORD.—The U.D.C. are to erect public baths in Trafford Park, at an estimated cost of £10,800, exclusive of site and street charges. The architect is Mr. Percy Howard, A.R.I.B.A., 88 Mosley Street, Manchester.

SUNDERLAND.—The Sunderland E.C. are to erect elementary and central schools on the Newcastle Road site at a cost of £61,750. The architect for the central school is C. A. Clayton Greene, Esq., F.R.I.B.A., Barclay Chambers, Fawcett Street, Sunderland, and for the elementary school the architect is O. Hall Mark, Esq., 15 John Street, Sunderland.

WARRINGTON.—Mr. J. Swarbrick, F.R.I.B.A., 30 St. Ann Street, Manchester, has been asked to advise on the restoration of St. Werburgh's Church, Warburton.

WESTERHOPE.—The Newburn U.D.C. are erecting 88 additional houses on their housing site at Westerhope. The architect is Mr. John Phillipson, housing architect, Council Offices, Newburn.

WIGAN.—The school buildings of the parish of St. Paul's, Goose Green, are to be improved. The architects are Messrs. Pennington & Unwin, F.A.R.I.B.A., Malvern Chambers, Library Street, Wigan.

WIGAN.—A memorial to the late Alderman Dickinson, designed by Mr. Leonard Barnish, F.R.I.B.A., is to be placed in St. Mark's Church, Newtown, Wigan.

London Building Notes

ALDWYCH.—Plans are being prepared for a new office building to be erected on the vacant site in Aldwych, which will contain 64,000 sq. ft. of office space. The architect is Sir Herbert Baker, A.R.A., 14 Barton Street, Westminster, S.W.1.

BASINGHALL STREET.—Excavation work is in hand upon a site at the corner of Basinghall Street and Gresham Street, E.C.2, where a large office building is to be erected which is to include a restaurant and a bank. The contractors are Messrs. H. Sabey & Co., Ltd., 7 South Wharf, Paddington Basin, W.2. The architects are Messrs. Robert, Angell & Curtis, F.R.I.B.A., 133 Regent Street, W.1.

BOUVERIE STREET.—The old premises of the "Daily Mirror" in Bouverie Street are to be demolished and replaced by an extension of the offices of the "News of the World." The architect is Mr. A. Alban H. Scott, F.R.I.B.A., 13 Old Square, Lincoln's Inn, W.C.2.

CROYDON.—The King and Queen will open, on June 25, the new wards and staff quarters which have been erected by Messrs. Higgs & Hill, Ltd., Crown Works, South Lambeth Road, S.E., as part of a large scheme of extension to the Croydon General Hospital, estimated to cost £250,000. The architects are Messrs. H. Berney & Son, A.R.I.B.A., 33-35 High Street, Croydon.

CROYDON.—A brick and artificial stone faced building has been designed for the new Addiscombe Telephone Exchange by Mr. R. J. Allison, F.R.I.B.A., Chief Architect to H.M. Office of Works, Storey's Gate, Westminster, S.W.

DEPTFORD.—A new £5,000 dispensary for the treatment of tuberculosis is to be built in Hoxton Street, Deptford, S.E., to plans prepared by Mr. H. M. Lawton, Town Hall, S.E. The contractors are Messrs. Bernard & Pickett, Ltd., 8 Woodcote Road, Wallington, Surrey.

EDMONTON.—The B.G. have placed a contract for the erection of new casual wards, to cost £20,000. The architect is Mr. J. C. Mummery, F.R.I.B.A., 34 Bloomsbury Square, W.C.

FULHAM ROAD.—Mr. H. M. de Colleville, architect, 48 Bedford Row, W.C., has designed a block of buildings, consisting of four floors, to replace Nos. 587 and 591 Fulham Road.

PRIMROSE HILL.—A new telephone exchange is to be built at Primrose Hill, N.W. The architect is Mr. R. J. Allison, F.R.I.B.A., Chief Architect to H.M. Office of Works, Storey's Gate, Westminster, S.W.1.

WESTMINSTER.—It is expected that a further section of the showroom extensions of the Army and Navy Co-operative Society, Ltd., will shortly be commenced. The first unit over the old Spencer Yard has now been completed. The architects are Sir Aston Webb, P.P.R.I.B.A., and Mr. Maurice Webb, F.R.I.B.A., 19 Queen Anne's Gate, Westminster, S.W.1.

WESTMINSTER.—A new Royal Westminster Ophthalmic Hospital is to be erected upon a site in Broad Street, Bloomsbury, at an estimated cost of £130,000, including equipment. The architects are Messrs. Adams, Holden & Pearson, F.F.R.I.B.A., 9 Knightsbridge, Hyde Park Corner, S.W.1.

WILLESDEN.—A new residence is to be erected on a site in Acton Lane, N.W.10, to the design of Messrs. A. Saxon, Snell & Phillips, F.F.R.I.B.A., 9 Bentinck Street, Manchester Square, W.1.

WIMBLEDON HILL.—A large billiard hall, with lock-up shops, is to be erected at the corner of Wimbledon Hill Road and Woodside. The architects are Messrs. North, Robin & Wilsdon, F.F.R.I.B.A., 35-39, Maddox Street, W.1.

WOOLWICH ROAD.—Alterations and additions are to be made to the Greenwich and Deptford Hospital in Woolwich Road, S.E. The architect is Mr. A. Roberts, F.R.I.B.A., 92 London Street, Greenwich, S.E.

Royal Institute of British Architects.—On June 20. Election of Council and Standing Committee. Election of members.

Royal Institute of British Architects.—June 20—25. British Architects' Conference, London.

Cement Marketing Company, Limited.—On Tuesday, June 28. Visit of members of Institution of County Engineers to the Kent Cement Works, Greenhithe.

Professional Societies

Auctioneers' and Estate Agents' Institute

At the Council meeting, held on May 13 at the Institute, Lincoln's Inn Fields, Mr. Alfred J. Burrows (Messrs. Knight, Frank & Rutley), of London and Ashford, was unanimously elected President for the ensuing year.

Midland Institute of Builders

It was reported at the annual meeting of the Midland Branch of the Institute of Builders, held at the Birmingham Chamber of Commerce, Mr. George Elkins presiding, that the total membership of the branch was now 108. The following officers were appointed for the ensuing year: Chairman, Mr. F. G. Hodges, Burton-on-Trent; treasurer, M. J. B. Whitehouse, Birmingham; and auditor, Mr. R. Friend, Rugby. Mr. S. G. Sapcote is president of the institute.

Why Architects and Builders Recommend VULCANITE ROOFING

—First—because it is water-tight, absolutely weatherproof and fire-resisting when covered with sand and gravel or $\frac{1}{2}$ -inch of tarmacadam.

—Because it is flexible, giving to movements in the boards or concrete.

—Because it is laid in layers: the first layer makes the building watertight, and this saves time by enabling finishing work to proceed on the floors below.

—Because it is tough and strong enough for the roof to be used as a Promenade, Roof Garden, Recreation Ground, etc.

—Because it is economical, low in first cost and long lasting.

—Because it is guaranteed by the makers and has stood the test of a quarter of a century's use.

"VULCANITE" has won the confidence of the Builder and Architect through sheer merit. It is used by H.M. War Department, H.M. Office of Works, as well as the leading Architects and Builders throughout the country.

It complies with the London Building Act and Building Bye-Laws of all Borough and Urban District Councils requiring an incombustible exterior roof covering, and is accepted by all the leading Fire Insurance Companies as a full Tariff Roof.

We shall be pleased to have your request for our Illustrated Booklet, and to supply estimates free.

A SUGGESTION

MAY we suggest that before purchasing Fireplace Suites or Sanitary Appliances you and your Clients should visit our recently re-arranged Showrooms at 17 & 18 Upper Thames Street, London, E.C.4.

The range of Fireplace Suites offered for inspection is a very wide one. A special feature is the number of beautiful Period Designs, many of which we owe to our own craftsmen of a century ago.

The Register Grate illustrated is in Armour Bright finish and fitted with the Hot Hearth Fire. It is particularly suitable for office or country house use.

A WORD IN SEASON

The Select Committee of the Commons, to which the Architects' Registration Bill was committed after its Second Reading, are progressing with their duties, and a report of the Committee's recent sitting appears on another page of this issue. If, as we are informed, there is dissatisfaction among many architects at the way the Measure is shaping, we would strongly counsel a truce to criticism and comment until the Select Committee have completed their labours. The sponsors of the Bill have had to face immense difficulties and obstinate opposition in unexpected quarters. It is unlikely that when the Select Committee have reported, there will be an opportunity for the Third Reading to be taken this session. The Bill will, therefore, have to be re-introduced next session for its final stage in the Commons; and, in the interim, the profession will, no doubt, have a chance of pronouncing upon it in its amended form. For the present, we regard criticism as ill-timed, and a serious hindrance to those who are disinterestedly devoting their efforts to furthering the cause of the Art and its votaries. It is no time for hasty and ill-considered judgments, nor for rash and impetuous condemnation.

The clear fact to be borne in mind is that the House of Commons has conceded the principle of the Bill. Remembering how very recently the Legislature has been asked to endorse the principle that fact is, in itself, a remarkable one. Few, previous measures of similar character have had such success in Parliament in so short a time. And that being so, the fact that the principal has been conceded, in terms less stringent, or less unequivocal than many of us would have liked, makes it all the more necessary to carefully weigh the pros and cons, the advantages and disadvantages, of the position when the Select Committee has had its final say upon the matter.

The fact that Parliament has decided upon some qualification of the word "architect," as a condition of Registration, is held by some to sufficiently condemn the whole Bill. We agree that the imposition of a qualifying word is a disappointment; yet the imposition is but evidence of the strength of vested interests, of ever-increasing encroachments by untrained men seeking to exploit the calling of architect as a profitable sideline to some other occupation, which past generations of architects

have allowed to grow unchecked and without protest.

To such an extent has the invasion of the architects' province proceeded, that Parliament will not now concede that any essential training is necessary to the adoption of the title. It may be assumed as easily as that of "citizen," and with about as much qualification. That pregnant fact emerges from the discussions in the House of Commons. The ostrich-like policy which the Profession pursued for the past fifty years has met with the nemesis that might have been expected.

But if the title of "architect" no longer counts for anything, the art of architecture should still count for much; and as the whole object of the Registration Bill was to safeguard the Art, to save it from increasing exploitation at the hands of the ignorant, rather than to protect the artist, there is still much work for the trained men to do, even in present circumstances. It is sound policy never to refuse anything that Parliament has conceded, even if it does not meet all your demands; it is always possible later on to ask for and obtain more, especially so if, by wise use of what you have, you demonstrate that it is to the public interest that more should be given. And this fact should give pause to those who are asking that the Registration effort should be abandoned. For if the principle of Registration is now thrown over, it is unlikely that it will ever be conceded by Parliament again.

For what is the alternative? Is it to be supposed that the exploitation of architecture by the untrained and incompetent will cease? Rather will it increase immeasurably, and to a point when architecture as an art will cease to exist. Do those gentlemen who sit calmly in professional chairs fondly delude themselves with the belief that the position of the individual artist is unassailable; that the designing genius must inevitably command recognition and a competence. If so they are singularly lacking in knowledge of the World. The tendency is all for architecture to be commercialised; to become a business for the commercial syndicate, a department of the general stores, a thing to become advertised in special lines and at sale prices like articles of women's wear. In such circumstances the trained man, if any man were fool enough to waste time and money on training, would become a trained hack behind the scenes, without recognition, without ambition, and without hope.

Notes and Comments

French Architecture

Sir Reginald Blomfield took "French Architecture in its Relation to Modern Practice" as the subject for the Zaharoff lecture which he delivered at Oxford last week. He dated the rise of the real Renaissance architecture of France to the reign of Henry II. and the appointment of Philibert del'Orme as Inspector-General of Buildings. Under Henry IV. the tradition was established, and a new type of domestic architecture emerged, exceedingly attractive, eminently sane, and, moreover, characteristically French. In the early part of the 17th century Francois Mansart took his stand on the lines of French rather than Italian architecture, and he was one of the greatest architects France had ever produced. At the death of Henry IV. there was a swing back to the Italian Motive. Under Louis XIV. there was a succession of competent and obsequious court architects ministering to the King's vanity. There was a deadly monotony about their work, and Versailles, St. Cloud and Marly, despite their profuseness and costliness, were disappointing. The influence of the younger Mansart was distinctly bad. The French instinct for form and logical design reasserted itself later, first in the work of the elder Gabriel, and in its final and consummate expression in the Ecole Militaire and the Petit Trianon by his son. These two buildings, in Sir Reginald's opinion, represent the high-water mark of French architecture. In recent years there were signs of a breakaway from the tradition, and this was not altogether for good. More important was the work of the Swedish architects, who had struck out a line of their own which entirely repudiated the French tradition. They had courage and invention; their danger was a search for novelty for its own sake. If the old French manner laid too great emphasis on form, in the Scandinavian it was not considered enough. Sir Reginald's comparison of modern tendencies is interesting, but we still think the new spirit in France will give us something worthy of tradition when it has had time to develop; and Denmark also must not be ignored, as the present exhibition in Queen's Square will testify.

Cities of Northern Africa

Mr. Arthur J. Davis took his auditors at the R.I.B.A. on Monday for a very pleasant tour among the picturesque cities of the North African countries. His lecture was conceived rather on the lines of a pleasant guide-book chat than a serious treatise; and, indeed, the architecture, past and present, of that part of the Mediterranean littoral is too varied and extensive, both in history and character, to be compressed into the limits of a general sessional paper. Its probable purpose will be served, however, if it awakens the interest of his brother practitioners, and stimulates their curiosity sufficiently to induce many of them to follow the route, or part of the route, of his own extensive tour. Probably the most amazing of the many cities visited was Mecknes, which, for all that it was planned and built by Mulai Ishmael, a bloodthirsty tyrant, is even more prodigious than the conceptions of his contemporary, Louis XIV., whose niece Mulai Ishmael aspired to wed. The 17th century will go down in history as one of mighty, if often extravagant, building schemes in many lands. It marked the beginning of a great architectural era in this country, which, however, was modest in comparison with that of France. Yet Versailles, although estimated to have cost, from first to last, £15,000,000 of money, taking the franc at par, pales beside the achievement of Mulai Ishmael, whose stables were

designed to accommodate 12,000 horses, and whose ambition, only partly fulfilled, it was to link with double walls the cities of Mecknes and Marrakesh, 300 miles apart. Mecknes, with its countless towers and minarets, as "a city of serenity and elegance, with streets relatively straight and clean, shop fronts elaborately incised, and endowed with life, animation and colour," shows itself to be so far removed from traditional Moorish cities like Fez, that Mulai Ishmael, for all his tyranny, must have been a man of parts. Apart from the Moslem cities, there are, of course, in Tunisia, many magnificent remains of mighty Rome. The study of British architects now goes much further afield. Spain and the Basque country have lately been receiving considerable attention. Before long the cities of Northern Africa will be tempting many to cross the Mediterranean, and Mr. Davis has given his confrères some useful hints of places that may be visited with advantage.

Country Cottages

Our colleagues of the general press surprise one at times with their disquisitions on matters architectural. The King's selection of a design, by Mr. Gerald Warren, for new cottages on the Sandringham Estate, moved Carmelite House, recently, to refer to modern architecture as in a bad way, whereas those more closely associated with it have been congratulating themselves that British architecture was showing signs of a new spirit and vigorous growth. We congratulate Mr. Warren on his success, but he would be the last to aver that he had no professional colleagues capable of designing good cottages. The British genius for compromise has been exercising itself for the past hundred years over problems political, sociological, and agricultural, many of which, in their latest manifestations, do not admit of the customary adjustment. After all, one can go on splitting differences up to a point at which further division becomes a physical impossibility. In the matter of estate cottages that point has long been reached. To reconcile the demands of decent and sanitary accommodation in such dwellings with an adequate economic return on their cost was impossible before the war, since when building costs have risen greatly. The enlightened estate owner was forced, two decades ago, to regard the housing of his workpeople, not as an investment, but as a necessary uneconomic part of the estate equipment, like fencing, drainage, or hedging and ditching. The position has not changed in the meantime, except for the worse. If cottage building shows deterioration in design, as our Carmelite confrères assert, it is because good architects are seldom employed to design them. Mainly, however, the appearance of what has been termed "the rash" of bad dwellings on the country-side seems to us to indicate an effort to escape the extortionate rents resulting from land speculation, high building costs and the desire of property owners to escape their share of the cost of the war. This has led many people to put up shacks or mass-production dwellings, which, if of poor or cheap material, and unsuitable to their surroundings, are the best they can afford. Nor is this country alone in this undesirable, after-war manifestation. Lord Riddell lately referred to the same distressing phenomenon at the Riviera; and outside Paris we have seen, within the past fortnight, three large areas given over to some kind of land settlement for industrialists, where most dwellings were hideous in the extreme and the best of them were conceived on the lines of a glorified doll's-house. The root trouble is economic, not architectural, but good design is easily obtainable if it is really wanted.

CHURCH AT GUERRE.
CARL BRUMMER, Architect.

EXHIBITION OF MODERN DANISH ARCHITECTURE

By HOWARD ROBERTSON, F.R.I.B.A., S.A.D.G.

Within the space of the last few years there have been in London exhibitions of modern Dutch, American, and Swedish architecture; and now it is the pleasure and privilege of the Architectural Association to arrange for a show of current Danish work and at the same time welcome in person a score of Danish architects who are spending a week in England, and, it is to be hoped, enjoying themselves as much as did the party of English architects which two summers ago visited Denmark under the auspices of the Architectural Association annual excursion.

It is because the Danes are our friends, and at the same time in a sense our guests, that it is difficult to write in a critical spirit of the Exhibition of Danish Architecture. Is it better to adopt the tone of international politeness, and omit all words which are not those of commendation, or set down one's impressions, quite honestly, for better or worse, realising that criticism is a personal thing and for that reason of narrowed importance?

The President of the Association, Mr. Alan Slater, in introducing His Excellency the Danish Minister, who opened the Exhibition, enumerated three special characteristics of the work shown, qualities to which were subordinated all other minor impressions. These were: Simplicity, Sobriety, and Commonsense.

No one will quarrel with Mr. Slater's opinion in this matter; Danish architecture is the reverse of complex, its sobriety is unquestionable, and commonsense almost, but not quite, follows as a corollary.

Nothing is more interesting than to watch the evolution of modern architecture in European countries. In Germany and Holland there has been wild experi-

ment, and architecture has almost reflected the "isms" of modern painting. In Sweden there has been a flowering of romance, more than held in leash by a restraining parallel cult of classicism, and in Denmark there is the movement the results of which are to be seen on the screens of the Exhibition.

Germany and Holland have sobered down, and in Germany at least there is emerging a clean and almost light architecture which is neither expressionism or romanticism, or classicism, but something modern and free.

This question of freedom is important, for freedom means flexibility and suppleness, and does not necessarily entail licence. And this quality does not appear to be a characteristic of the type of expression which Danish architects are favouring in their modern work.

A survey of the Exhibition shows that the predominant tendency is a careful development of Danish tradition with a pronounced leaning towards its classical phases. Some of the modern work is in fact almost indistinguishable from old work. This is not a reproach, but merely serves to show the extent to which tradition is revered. It is not only revered, but one may almost say that the essence of tradition has been distilled, and all by-products eliminated, so that there remains something very pure, but which is apt to be without flavour. This architecture is pure, it is eclectic, distinguished, refined, based on fine models; but somehow it has been emasculated. One feels in it the absence of daring, of the spirit of adventure. It is the cult of beauty, but not, of stirring, passionate beauty. The Danish beauty is

THE ARCHITECT'S OWN HOUSE, VALBY, COPENHAGEN.
POUL HOLSOE, Architect.

meticulous, it is measured with dividers. Classicism, classical spirit, call it what you will, is a hard task-master. Once the spirit has accepted the classic convention, and begins to revel in its very limitations, in the opportunities which it presents for an exhibition of negative virtues, the danger becomes real. One may find oneself sliding backward towards the allurements of those past periods which provide such delightful themes for essays in style, forgetting that architecture is much more than a question of classicism, or romanticism, that it involves the architect in the search for finer plans, better solutions to problems of light, and air, and hygiene, in every kind of creative inventiveness.

Everything lies in this question of what spirit one looks for under the skin of building. Is refinement of greater value than vitality? Is a feeling for intellectual scholarship better than a good plan? Can the many charming shapes of the Copenhagen Police Court and the intellectual pleasure which it gives, compensate for a plan which in pursuing the beauties of tradition has faithfully included a crop of traditional defects? And should we to-day build a church so elegant as that of Kaj Gottlob (53) in which so many of the congregation see so badly? Surely it is better to plan, like Gjerlöv-Knudsen, so that every consideration is given to the lighting of the altar and visibility generally (48). Here is a problem which is

difficult to treat in satisfactory architectural form, but which marks a contribution to architectural thought.

It is difficult to criticise the plans shown in the Exhibition. One knows so little of the problems. The school buildings, the crematoria, the theatres, even the housing schemes and private houses have requirements which would probably differ widely from our own. One has, however, the impression of pleasant rather than spectacular effects, of a desire to tickle the intellectual palate, of a wilful suppression of the pompous and grandiose, and of a preoccupation with questions of taste. Nothing which cannot pass the acid test is to be admitted; better a bare wall than piece of ornament which has loved and lost. Plan proportions are pleasant, and the character of the plans is the character of the exteriors.

As regards the external architecture, the desire for restraint and sobriety has produced buildings which are reduced to the simple expression of walls, roofs and openings. Very good openings they are, beautifully spaced, as in Carl Lundquist's public school (137), in Frits Schlegel's design for a town hall at Lyngby (169), which reminds one of the Adams House in Chandos Street, and in Kay Fisker's housing block in Copenhagen (in collaboration with G. Holst). This latter is a fine mass of brickwork in English bond, with a tile roof. It reminds one of Adshead &

Ramsay's flats on the Kennington Estate, and that is a high compliment (28).

Well proportioned rows of windows are important, but they do not stir the emotions. It is therefore a relief to find that the Danes, like the Swedish—and ourselves—have a good deal of sentiment in their architectural make-up. One would like to say that their classicism has a dash of the romantic in it, but "romantic" is to-day almost a term of opprobrium. So we will be content with the sentiment, which appears in many designs of widely different character, and turns sobriety into something much more likeable.

Carl Brummer's church at Gurre (14), near Elsinor, is whitewashed and tiled, with tiled buttresses and—the words will out—a romantic tower. It fits with complete perfection into a lovely country site. Carl Brummer is, however, not a die-hard classicist, as his gymnasium in Copenhagen shows, for with all its

orderliness its entrance has breadth and power and life (12).

There is sentiment in the human touches which Helweg Möller has introduced into his business premises (61), and a complete and lovable phantasy in the pavilion for the Royal Copenhagen Porcelain Factory (62) which we all admired at the Paris Exhibition. The little Liqueur Pavilion at Tivoli, Copenhagen (63), is very nearly as good.

This is not, however, a catalogue of the romantic or sentimental notes introduced into the architecture of the Danish Exhibition. We merely wish to point out that in modern Danish architecture the sentimental or romantic element is not eliminated, and that it is just as possible to introduce sentiment into a Regency waiting room for a shipping company as into a pinnacle of Ostberg's Stockholm Town Hall. It is merely a different brand of sentiment.

There is some excuse for harping on this accompaniment of a classic serenity by a less frigid note in the appeal to the emotions by the placing and design of detail, for while the classic background gives the tone, it is a tone which is very nearly negative in character and which requires a contrast to give it value. There would seem to be, in modern Danish architecture, a positive danger in the cultivation of negative qualities, and the suppression of free flights of imagination. There must be many who feel that the Danish formula, as we see it at the Exhibition, is not a completely satisfactory one in which to develop the lines of modern architecture, and that the high scholarship of the Danish architect requires to be warmed by an occasional breath of feeling, even passion.

When, however, we compare the achievement of Danish architects with our own, we find, as usual, that we have a great deal to learn from them. The classical outlook which can be said to dominate their most recent work requires an accompaniment of real knowledge of essentials, matters of proportion, of the expression thereby of character, of detail, of effects obtained with economy of means. In these things our Danish friends are masters, and this high compliment is one to which every architect who visits the Exhibition will subscribe.

There are examples of skill in simple treatments which we can all admire, such as the delicately modelled flat ceiling and the patterned brick floor of Eduard Thomsen's Mortuary Chapel at Ørdrup (179), Kaj Gottlob's projected exhibition pavilion for Rio, done in a peasant style with a brilliant scarlet doorway (52), and the very pleasant houses of Sven Risom for factory employees (162), as good as anything done in this country. There are, on the other hand, works which appeal through a high quality of composition and detail study, and of these one of the finest, and most attractive and unaffected designs, is the building for the Shipowners' Union in Copenhagen, by Emanuel Monberg. Besides some charming detail with an Empire flavour, there is furniture to match, the drawings for which, hung at Bedford Square, repay examination.

This building shares with the Grundtvig Church, Copenhagen, the honours of wall space in the Exhibition. The Church, by P. V. Jensen Klint, towers in gigantic scale over "The Town on the Mountain" whose houses cluster round it. It is a vivid conception, but there is something uneasy in the movement of the great west front (103).

Of schools there are several, one of the pleasantest being that of Chr. Kampmann, who shows (92) a broad and sunny colonnaded courtyard with wide hospitable proportions, a classic architecture which manages to "stand at ease." At Viborg (93) is a secondary school by the same architect which has good detail.

There are other works of special character, such as the interesting scheme for baths at Spalato, by Möller, Thorsen and Hansen (148), light and sparkling, and shown in an interesting set of drawings; a rotunda in a Workmen's Meeting House at Horsens (151) by V. Norn, with a robust flavour of C. F. Hansen, an electrical works by Ivar Bentsen (5) which shows how to give life to the wall of an engine room; a spaciouly planned house at Valby (146) by Monberg; and "the architect's own house" at Copenhagen (68) by Paul Holsoë. A very nice house it is, with a stone-flagged entrance between projecting wings, lined with clipped trees and enriched with just the right (and romantic!) type of architectural fragment.

There is too much domestic architecture of good quality to mention in detail, in brick, and stucco, and whitewash, and pantile, and thatch, very quiet, very pleasant mannered, and coming nearer, perhaps, to

our own ideals than the domestic work of any other country. There is one house which comes more than close, the residence of H. J. Wengel in Copenhagen, by L. Hygom (74). It might be in Regent's Park; as regards the entrance front, with its two globular lamps in iron standards, we wish it were. But we are glad for the garden elevation to remain in Copenhagen.

To make a catalogue is tedious. The Danish Exhibition is a notable one, which every architect must see—and appraise—for himself. The Danes, one feels, have found something more than a formula in architecture, and something less than a creed. They have almost eliminated what is bad; they are helping in the search for what is good. And by sending us their Exhibition they are helping and stimulating us to better things.

Competition News

HERNE BAY.—The U.D.C. Municipal Offices Committee report that the President of the R.I.B.A. has nominated Professor A. E. Richardson, F.R.I.B.A., to act as assessor for the new municipal offices. The Committee have made it quite clear that the Council's primary object is the provision of municipal offices and business premises which would enable the site to be developed in a manner commensurate with its commercial value. Regard should be had to the possibility of an assembly hall being erected either simultaneously with the municipal offices and business premises or at a subsequent date. He was, therefore, requested to frame the competition conditions so as to provide for the whole of the contemplated works, but in such a manner that they would be carried out in sections as parts of a comprehensive whole.

STRODE PARK ESTATE: HOUSING DESIGN COMPETITION.—The R.I.B.A. Architectural Competitions Committee report that the conditions are not in accordance with the published regulations. Members, therefore, must not take part in this competition until the conditions are amended.

WEST BROMWICH COUNCIL SCHOOL.—The Education Committee propose to organise an open architectural competition for a new Council School on the Charlemont Estate.

COVENTRY.—Architects practising in Coventry are invited by the Education Committee to participate in submitting competitive plans for a new senior department at Stoke Council School, the cost of the building not to exceed £15,000. Premiums are offered for the first three sets of plans placed in order of merit by the assessor amounting respectively to £60, £40, and £20.

Charing Cross Bridge

The London County Council, at their meeting on Tuesday, adopted the recommendation of their Improvements Committee to concur in the appointment, by the Minister of Transport, of Messrs. Mott, Hay and Anderson to investigate the question of the construction of a road and railway bridge, with approaches, over the Thames at Charing Cross. The Council's chief engineer and another engineer, to be appointed by the Southern Railway Company, will join the other three engineers in reporting on the matter.

R.I.B.A. Examinations for Probationership

The Council of the R.I.B.A. have decided to exclude, after December 31, 1928, from the list of examinations recognised for the probationership, the Junior (Honours) Local Examinations conducted under the authority of any University in the British Empire.

MAIN ENTRANCE, QUEENS ROAD: NATIONAL PHYSICAL LABORATORY, TEDDINGTON.
F. A. LLEWELLYN, O.B.E., Architect (H. M. Office of Works, London.).

THE NATIONAL PHYSICAL LABORATORY, TEDDINGTON

The design of laboratories has in recent years become an important branch of architecture, and the complex requirements of these institutions have received very careful study. Such requirements occasionally appear to be difficult of fulfilment in a design which is to take its place as a sub-unit in a group of buildings comprising other structures, serving social purposes different from its own. Where, for instance, it appears desirable that a laboratory room should substitute for its solid walls as much glass as possible, in order that the work of scientific investigation may be conducted in the very best conditions of lighting. It is obvious that such structures would ill accord with neighbouring buildings of the traditional kind. An those occasions, however, when it has been found possible to make a new structure serving a highly specialised purpose harmonise with its architectural environment, considerable credit attaches to the achievement. Mr. F. A. Llewellyn, of H.M. Office of Works, is to be congratulated, therefore, upon his designs for the National Physical Laboratory Buildings at Teddington, which not only serves utility and engineering requirements, but also possesses a considerable architectural interest.

The National Physical Laboratory was founded by The Royal Society, and in 1901 became a public institution for standardising and verifying instruments for testing materials and for the determination of physical constants. In the early days this work was performed in laboratories fitted up in Bushey House, a fine old residence which was once the home of William IV and Queen Adelaide. From the nucleus of these laboratories in Bushey House has grown the present institution, consisting of some twenty-five buildings, administered by the Department of Scientific and Industrial Research. The functions of the present-day laboratory comprise eight main sections of experimental and research work, and include not only engineering, electro-technics, metallurgy, chemistry, but also gauge-testing metrology and aeronautics, together with the general administration and a separate laboratory devoted to Admiralty research work. Soon after the late war the expansion and development of these scientific activities necessitated the acquisition of additional land contiguous to the laboratory to permit of the erection of further buildings. This land, which will suffice for expansion for many years to come, has been laid out with roads and services to meet possible future requirements, and a number of the newer buildings have been erected here in conformity with a pre-conceived scheme.

The accompanying photographs illustrate the buildings and laboratories erected since the war. An examination of the designs will reveal the fact that these new structures in their general architectural treatment have been influenced by the traditions of Bushey House and other fine old Georgian buildings in which Teddington and the immediate vicinity abound. The extreme simplicity of Georgian work, which permits of large windows combined with imposing expanses of brickwork, is peculiarly appropriate to modern buildings serving a utilitarian purpose. Of the buildings erected since the war, the Admiralty Research Laboratory, which fronts Queen's Road, consists in the main of one storey with a two-storey central block. The plan is of an inverted "T" type, and provides for small scale laboratories for both physical and chemical work, together with engineering workshops and a small experimental tank. The building is faced with Crowborough purple bricks, with red Daneshill dressings to windows and quoins. The elevation towards the street is a charming composition in the Georgian style, in which a central pedimented doorway gives just the right note of emphasis to this block of office buildings. The orderly fenestration surmounted by long parapets produces an effect of dignity and restraint. The rear elevation, as seen from the south-west, showing the façades of the laboratory, accords admirably with the street frontage, in spite of the fact that the buildings facing this aspect differ in character from the office quarters, and consist of much larger apartments requiring to be especially well lit. The great round-headed windows are tied together by a substantial string-course which takes up the diameter of the arches and further performs the useful æsthetic function of giving additional coherence to the row of smaller windows by crowning the voussoirs of the flat arches above the latter.

The High Voltage Laboratory, which has just been completed, is to accommodate electrical equipment enabling pressures up to 1,100,000 volts to be obtained. This electrical equipment will consist of three transformers with the necessary generator plants and auxiliaries for supplying them with current. Each transformer is rated at a voltage of 330,000, and when the three are connected in series the before-mentioned pressure of 1,100,000 volts will be obtainable. One of the principal uses of the plant is to enable tests to be made on insulators, switch-gear and other apparatus for use on extra high-tension power transmission lines. At present British manufacturers are handicapped by the lack of such testing facilities. Another important application is in the development of

NATIONAL PHYSICAL LABORATORY, TEDDINGTON. F. A. LLEWELLYN, O.B.E., Architect (H.M. Office of Works, London).

methods of power measurement at these high voltages. This is an extremely difficult problem, and the present plant has accordingly been designed and arranged to permit of specialised and accurate research work being carried out. The accompanying illustrations of the High Voltage Laboratory building show a decorous exterior, in which the Georgian style once more proves itself to be suitable for a structure having a quite modern architectural purpose. In this instance the façade towards the road has two storeys, of which the centre portion projects as a tower, and is further elaborated in that it contains a rusticated entrance portico surmounted by a tall, arched reveal extending over three storeys. A fine stone cornice and parapet crowns this tower. The other illustration shows the rear of the building, which presents the appearance of a large, rectangular box, of which the walls are decorated by horizontal courses and corner piers which frame in large surfaces of brickwork, pierced on one flank by three windows of generous scale, and on the other by a single blank window. This latter well justifies its existence, for it helps to make the façades homogeneous, and lends interest to a part of the building which without it would appear dull and lifeless.

The electrical sub-station was designed to accommodate the machinery and gear for developing varying voltages and frequencies to meet the specialised demands of departments carrying out work within the National Physical Laboratory. The electrical installation within the building consists in the main of generators, switch-gear and batteries in sequence. The building is a simple, one-storeyed structure, faced with red Daneshill bricks, the roof being covered with rustic monastic slates. Here the central feature consists of a slight projection surmounted by a low-pitched gable, with generously overhanging verges, terminated by returned cornices crowning the rusticated brick piers at the lateral extremities of the projection. Within the gable and extending beneath it is a round-headed window placed above the entrance doorway, which is flanked on either side by tall windows extending from plinth nearly to cornice level. The building has five bays to right and left of the central feature, these bays being divided by piers that frame in an orderly array of rectangular windows.

The laboratory buildings are in a style which, although masculine and unaffected, is by no means devoid of a decorative quality. Moreover, the entrances to the site have been studied with great care. When land for extension was acquired immediately after the war it became apparent that the diversion of an existing right of way to Bushy Park was necessary in order to keep the work of the National Physical Laboratory within a ring fence. The new entrance was planned leading to a circus, from which there radiated the principal roads giving access to the existing laboratories and the land for develop-

ment. Gates and screens of wrought-iron, of simple treatment inspired by Tigou ironwork at Hampton Court, form the main entrance to the laboratory from Queens Road, and a highly pleasing and dignified composition is completed by a small gate-keeper's lodge, which is faced with Crowborough bricks with red dressings and has a high-pitched roof, covered with grey-green rustic slates. In addition there has been provided a new entrance giving access from the right of way. This is formed in the old wall surrounding Bushy Park, and consists of an arched opening surmounted by pediments and filled in with delicate wrought-iron work. The bricks of this arched entrance were especially selected to harmonise with the old brickwork of the wall on either side of it. These buildings add one more testimony to the efficiency of the architectural staff at H.M. Office of Works.

The general contractors for the High Voltage Laboratory were Messrs. Chessume & Co., Tottenham. The sub-contractors include the following: Messrs. S. & E. Collier, of Reading (bricks); Messrs. Arthur Thornborough, Ltd., Tottenham (five interlocking steel revolving shutters with main chain gearing); Messrs. Arthur L. Gibson & Co., Ltd. (the Kinnear Rolling Shutter as seen in our south-west view of the building); Messrs. The Carron Co., London (wrought-iron railings); Messrs. J. R. Pearson (Birming, Ltd.), Birmingham (cast-iron grilles); Messrs. Dorman Long & Co., Ltd., Middlesbrough (steel work); Messrs. Permanite, Ltd., London (roofing material); Messrs. Neuchatel Asphalte, Co. London (asphalting to the pit, etc.); Messrs. Williams & Williams, Chester (steel sashes); Messrs. J. C. Spooner & Son, London (plumbing); Messrs. Mackenzie & Moncur, Edinburgh (manhole covers); Messrs. J. Duckett & Sons, Burnley, and Messrs. Dent & Hellyer, London (sanitary fittings); Messrs. French Asphalte Co., London (asphalte to flat roof);

Messrs. F. J. Barnes, Ltd., London, and Portland (Portland stone); Messrs. Educational Supply Association, Ltd., London (Esavian windows).

The general contractors for the Admiralty Research Laboratory were Messrs. Collinson & Co., Teddington. The sub-contractors include the following: Messrs. Crowborough Brick Co., Sussex, and Daneshill Brick and Tile Works, Ltd., Basingstoke (bricks and facings); Messrs. London Brick Co., London (flettons, common); Messrs. Salter, Edwards & Co., London (asphalte); Messrs. F. Moss, Teddington (stone); Messrs. Lambourne & Co., Openshaw, Manchester (steel); Messrs. Roberts, Adlard & Co., London (slates); Messrs. Permanite, Ltd., London (roofing material); Messrs. Nicholls & Clarke, Shoreditch (glazing); Messrs. G. M. Hammer & Co., London (laboratory fittings); Messrs. Pickup, Ltd., Horwich, Messrs. Shanks & Co., London, and Messrs. Dent & Hellyer, London (sanitary fittings); Messrs. H. Hope & Sons, Ltd., London (bronze door furniture); Messrs.

ARCHITECTS' REGISTRATION BILL

Proceedings of the Select Committee

WESTMINSTER, Wednesday, May 18.

The Committee continued their inquiry on Wednesday, May 18, when the whole of the sitting was occupied in the further examination of Major Barnes. He stated that he had not, up till that time, received the list of questions which it was proposed at the last meeting that Mr. Tasker should send to him in order that considered replies could be prepared. The witness had, however, compiled a statement which he proposed to hand in, and which contained information which he had gathered on some of the points raised by Mr. Tasker, first, with regard to the examination by the R.I.B.A. of district surveyors; second, the action taken by the R.I.B.A. in relation to steel-framed buildings; and, thirdly, with regard to the action taken by the R.I.B.A. in connection with reinforced concrete construction. At a later stage in the sitting Mr. Tasker examined the witness on these matters.

Mr. Lindley, M.P. (a member of the Committee) asked witness whether the intention of Clause 12 of the Bill, relating to penalties, was to deal with persons who held themselves out as being registered architects but were not, and whether the clause was wide enough to avoid the punishment of anyone who had acted merely by inadvertence? Major Barnes replied that there was no intention to punish inadvertence, but only misrepresentation.

Questioned by Mr. Lindley with regard to the effect of the Bill on the number of people likely to enter the profession, witness said that they had been guided by precedent in the matter of setting up a body to supervise registration. Realising the feeling against closing the profession, they were endeavouring to make it more open than it was at present.

Mr. Lindley: Are you satisfied that by creating a close professional corporation you will not, in fact, give greater power for closing the profession?

Major Barnes: That will not be the case under this Bill. The powers that have been exercised in the medical profession, for example, could not have been exercised if the medical profession had had a Discipline Committee such as we are proposing under this Bill. If the body controlling the medical profession were a body such as we propose, containing two outside members—one a member of the legal profession and one a representative appointed by the Ministry of Health—then I do not think they would have the powers they use at present.

Mr. Lindley asked whether witness considered that the powers under Clause 7, providing for the removal of names from the register, would deter men from coming on to the register. Major Barnes said he did not think the clause would have that effect.

Mr. Lindley: Will the Council determine what is disgraceful professional conduct? Witness: No; the Discipline Committee will determine that.

Mr. Lindley asked whether it was true that under the charter of the R.I.B.A. no architect might be a builder or carry on any similar business whilst practising as an architect.

Major Barnes said that that point was dealt with on pp. 101-102 of the code. There was, he explained, no direct prohibition of an architect acting as a builder, but there were certain clauses which, read together, had the effect of making it impossible for an architect to be in a position, under a competitive contract, of both architect and builder. What had governed the R.I.B.A. in framing that code was that an architect, under our modern system, was a person who stood between the building-owner and the builder. It was his duty to protect the building-owner, who

paid for what he got and no more. The architect was not allowed, under the code, to have any financial interest of any kind in any building for which he was acting as architect, other than that of receiving a fee from his clients. The idea of the code was that he should not be interested in building material, or the building of which he was architect, or the supplies of labour, or in any firm of builders which might be quoting for the job. Therefore, while there was no direct prohibition on an architect being a builder, the effect of the clause and the spirit in which it was framed was to preclude an architect who was a member of the R.I.B.A. from being a builder.

Mr. Lindley said he noticed that the code laid it down that an architect "must not attempt to supplant another architect." What would be the effect of the code, he asked, in a case where a man employed by a public authority as an architect, took private work and cloaked that private work by putting the name of another architect to it?

Major Barnes: The decision of the R.I.B.A., if such a case came before it, would entirely depend on the merits of the case. I should imagine that the facts of the case, as barely stated, and considering what the term "cloaked" implies, would be such that the R.I.B.A. would regard it as a case of unprofessional conduct on which they should take action.

Mr. Lindley asked witness whether he admitted that there were many architects practising to-day who had not any academic training, but had made their names largely through experience as workmen and by attending technical schools, and were none the less working to the satisfaction of everyone concerned.

Major Barnes: I should not hesitate to say there are. I do not know that I have come across any such persons, but I think it is quite conceivable that there are such persons. I think I can safely say, however, that there cannot be any very considerable number of such persons.

Mr. Lindley: Can you give the Committee any idea as to the number?

Major Barnes: No, not at all.

Mr. Lindley: You have made no effort to obtain information on that point?

Major Barnes: I do not think it can really be obtained by any professional body. It would mean practically taking a census of the profession. I think perhaps you might be able to muster 100 men of that kind.

Mr. Lindley: Would not the registration of competent men more or less stigmatise as outside the profession any who did not enter the register?

Major Barnes: They would be entitled to come on to the register, and if they did not do so, it would probably be because they did not think it worth their while.

Mr. Lindley: But would they not be regarded as more or less incompetent if they did not go on to the register?

Major Barnes: No. We do not think such a distinction would arise on the passing of this Bill.

Replying to a question by Mr. Lindley regarding the fees to be charged, witness said he proposed to put the Committee in possession of information as to what was being done in other professions. It would, he added, be improper for them in this Bill to attempt to bind any body set up under the Bill.

Mr. Lindley asked what was the object of Clause 8, which provided for the restoration of names to the register.

New Ways and Means

*The Editor will welcome early information of
New Plant, Materials and Fittings*

New Saw Bench: Rear View.
(Watts Bros. (Sheffield), Ltd.)

A New Type of Saw Bench

A new saw bench in which the main frame and outer bearing support are in one solid-box casting, thus ensuring the rigidity which is essential to the successful running of ball-bearing machines, is one of the new productions by Messrs. Watts Bros. (Sheffield), of Triumph Works, Keeton's Hill, Sheffield. From the illustrations given it will be seen that the handwheel for raising and lowering the table is placed in a convenient position for the operator, and that ample foot room is provided on all sides of the machine. Ample provision is also made for the clearing away of sawdust. The saw itself is completely incased under the table, so that no extra bottom guards are required, but an easily removable front plate is fitted to allow access to the saw and front bearing when necessary. The loose pulley runs on ball bearings, which are carried on a fixed sleeve instead of on the saw spindle in order to avoid the "creeping" of the saw when running on the loose pulley. This latter is also slightly smaller in diameter than the fast pulley to relieve the tension on the belt and the strain on the machine when the saw is not cutting. The machine will accommodate saws up to 32 in. in diameter; the table measures 4 ft. 6 in. by 2 ft. 2 in.

An Improved Joint for Light Gauge Tubing

An improved compression joint for light gauge copper tubes, which is now so widely in use for domestic hot and cold water service, has recently been introduced by Messrs. James H.

The New "Securux" Pipe Joint.
(James H. Lamont & Co., Ltd.)

Lamont & Co., Ltd., of 104 Buccleuch Street, Edinburgh. This new "Securux" Coupling, which is illustrated in section, comprises three detachable parts, instead of four as hitherto, the inside sleeve being attached to the hexagonal nut but retaining the rotatory movement necessary to give a straight draw upon the pipe which is so essential in all compression joints. By this means the actual fitting operation is made foolproof, in that the inside sleeve cannot be lost or forgotten until after the pipe has been expanded. The form of the conical shaped nipple and the tapered bore of the screwed portions of this coupling also enables the joint to be made with the least possible pressure whilst giving the necessary resistance required to prevent the shoulders of the coupling being drawn together. Fitted to a 19 s.w.g. copper tube of $\frac{3}{4}$ -in. bore, these joints have been tested up to 5,000 pounds per square inch hydraulic pressure.

Combination Tube Bender and Vice.
(William Edgar & Son, Ltd.)

A New Gas Fitting Appliance

The Combination Tube Bender and Vice which we illustrate has several new features which are claimed to overcome the chief difficulties associated with the fitting of copper or brass tubes as used for gas connections. In this tool the rollers are arranged in such a manner that it is unnecessary to "load" the tube before bending. The vice portion is also individually adapted for tubes of the three bores commonly in use— $\frac{3}{8}$, $\frac{1}{2}$ and $\frac{5}{8}$ inch—so that during the cutting or screwing operation there is absolutely no risk of crushing the tube. Messrs. William Edgar & Son, Ltd., of Blenheim Works, Waterloo Street, Hammersmith, W.C., are the makers of this handy appliance, which has an overall length of 8 $\frac{1}{2}$ inches.

The Two-Wheel "Little Giant" Mixer.
(Frederick Parker, Ltd.)

A Mixer which can be Hauled

Our illustration shows a new model of the "Little Giant" Concrete Mixer which has been placed on the market by Messrs. Frederick Parker, Ltd., of Viaduct Works, Leicester. So far as the mechanical details are concerned, this machine is almost identical with the original "Little Giant" made by this firm, the difference being that two wheels are provided instead of four. These wheels are essentially trailer wheels, placed well to the rear of the under carriage, so that the shaft can be mounted at the back of a lorry when moving the machine from one job to another. The mixing drum has a batch capacity of three cubic feet, which is equivalent to four cubic feet of unmixed material. The under carriage is built up from steel channels, and the cross arm which supports the mixing drum is of the self-balancing type.

A Safe with an Electric Alarm

A safe which may be said to "scream for help" when touched by an unauthorised person is being made by Messrs. C. H. Whittingham, of 102 Cox Street West, Balsall Heath, Birmingham. This fitment is electrically operated, but can be used in any situation as it is entirely self-contained, and the adjustment can be set to a very fine degree of sensitiveness. For instance, it may be so arranged that the alarm is given if the lock or the handle is tampered with in any way, or, alternatively, if the safe is attacked from the back or sides or tilted up prior to its bodily removal. The alarm can be set at the option of its custodian, and when put into action it will continue for several hours until the batteries have run down or until it is stopped by the possessor of the keys.

New Saw Bench: Front View.
(Watts Bros. (Sheffield), Ltd.)

Major Barnes: It enables us to say that a man shall not be disqualified for all time, but may be suspended for a specific period.

Mr. Hirst, M.P., then proceeded to examine the witness, and asked whether they might take it that the R.I.B.A. were the sole promoters of the Bill.

Major Barnes: If I say "Yes" it might create a false impression, because the R.I.B.A. is a body so wide in its organisation that it contains not only men who are members of the Institute but also those who are not members, as in the case of members of the Institute's allied organisations in Scotland and Ireland.

Mr. Hirst asked how many members of witness's own organisation would be registered under the terms of the Bill. Major Barnes: They would all come within the different clauses of the Bill.

Regarding the number of members, witness said that the total membership of the Institute was 6,129. Of that number, the honorary fellows, honorary associates, and honorary corresponding members, numbering 130, would probably not desire to be registered. In round numbers there would be about 6,000 members, excluding students.

Mr. Hirst: Is there any other body which can be said to be absorbing architects, and can also be regarded as professionally qualified to come under the terms of this Bill? Witness: Such bodies do exist. The R.I.B.A. now comprised also the Society of Architects, by amalgamation in 1924. At that time, those two bodies were the only architectural bodies in existence. After the amalgamation two other bodies came into existence—the Faculty of Architects and then an offshoot from that body, the Incorporated Association of Architects. Both those bodies will, under the Bill, have representatives on the Admission Committee and on the Board of Architectural Education. I cannot speak as to the number of their members.

Mr. Hirst: You cannot speak as to the strength of those two bodies? Witness: No, I can only assume, taking into account the membership of the R.I.B.A. and its allied societies, and the very recent formation of these other bodies, that their membership cannot be very considerable.

Mr. Hirst: Has there been any attempt on the part of these bodies to associate themselves with the R.I.B.A. in the promotion of this Bill? Witness: Yes, there have been negotiations and, as far as I know, these two bodies are as devoted to the cause of registration as the R.I.B.A., and are entirely in favour of the Bill. The result of the negotiations led me to believe that their inclusion on the Admission Committee and the Board of Architectural Education would entirely satisfy them.

Mr. Hirst: Have these negotiations been very recent? Witness: During the past two or three months.

Mr. Hirst: You are not aware perhaps, then, that the Incorporated Association are looking on the Bill with suspicion, at least with regard to the administrative parts of it? Witness: I know they desired that the Council entrusted with the register should be a Council of the nature of the General Medical Council. I have had no discussion with the Incorporated Association since it was decided to qualify the word "architect." I have already pointed out that there is no analogy between the situation that existed in the medical profession and that in the architectural profession. When the Medical Bill was put through you had bodies of almost equal status, such as the Royal College of Physicians of London, the Royal College of Surgeons of Edinburgh, the University of Dublin, with its medical degree, the Society of Apothecaries, and other bodies. Therefore the only way was to form a General Council on which those bodies would be represented. But there is only one

body of architects that has any age or tradition behind it, and that has any appreciable number of the architectural profession in it. The position is, however, analogous to that of the veterinary surgeon where there was a Royal College of Veterinary Surgeons which occupied exactly the same position as the R.I.B.A., and, in their case, Parliament said that the position of that body being so unquestioned, they should be entrusted with registration. That is our position, but we have endeavoured to safeguard the position of all other bodies by giving them representation on the Admission Committee and the Board of Architectural Education.

Replying to a further question as to the standing of the Association, witness said he did not wish in any way to reflect on them, but he was bound to say that he did not think they had up to the present established themselves in such a position as would justify any claim to form a general architectural council. They had hardly been in existence more than a year, and were themselves an offshoot from another body. There had, as a matter of fact, been some difficulty in the course of negotiations on account of the rivalry between the two bodies. He considered that the safeguards offered them were all they were entitled to. He thought their organisation included not only architects but also quantity surveyors as a distinct branch. In a way, the Association occupied a sort of intermediate position between the R.I.B.A. and the Surveyors' Institution. The Surveyors' Institution had a section for quantity surveyors, but they had no such section in the R.I.B.A.

Mr. Hirst: Are any members of the R.I.B.A. also members of the Incorporated Association? Witness: I have no exact information, but I should imagine only a very small number indeed. He added that the membership of the Association in the last year or so was, he believed, without examination in the first place.

Mr. Hirst said that during the second reading debate it was stated that the promoters of the Bill desired to give every opportunity for working-class people to qualify under the Bill. Could the statement that there was equal opportunity for the working-class boy be justified by the number of scholarships issued by the R.I.B.A.? Witness said there were six scholarships in being, and they might run on for three years, depending on the needs of the boy.

Asked whether he had any idea as to the approximate total cost of training a boy so that he would be able to come within membership,

Major Barnes said: I cannot give you a figure of that kind at the moment. Assuming that a full course takes five years, you have to maintain the boy during that time. He might be able to earn something, but the main cost would be his maintenance. The examination fees of the Institute would be about five guineas, and there would be in addition the fees of the schools. Under this Bill a boy from an elementary school would be able to qualify fully as an architect through the stages of an academic training, every stage of which could be supplied, as far as cost is concerned, by grants of scholarships. In the old days the main question to anyone becoming an architect was that he went as a pupil to someone, and that someone rooked him for a premium. (Laughter.)

Mr. Hirst: That practice has not died out altogether, has it? Witness: I think you may say that the educational system of the Institute is killing it. Now a boy can start from the elementary school, and there is not a barrier that cannot be bridged if educational authorities are fulfilling their obligations.

On the question whether the clause dealing with penalties was intended to apply to social and other conduct as well as to professional conduct, Major Barnes said no. The words in the clause are "dis-

R.A., Exhibition, 1927.]

CHURCH OF ST. MARY AND ST. THOMAS, GORTON, MANCHESTER.
WALTER TAPIER, A.R.A., Architect.

graceful conduct." There is a lawyer and a representative of the Ministry of Health on the Committee, and that will ensure a very proper interpretation. If I were on the Committee I should certainly not interpret the phrase as applying to personal conduct.

Captain Wallace, M.P.: Is there any appeal against the decision of the Committee? Witness: The Bill provides for appeal to the High Court.

Mr. Lindley: Will not that be very expensive? Witness: We considered the question of a lower court, but there were very great difficulties in the way.

Lieut.-Col. Moore, M.P., said he wanted to suggest a small amendment. It had occurred to him that it might create an injustice if the University of Dublin were excluded from the list of bodies whose diplomas in architecture were to be taken as qualifications under the Bill.

Major Barnes said he had no hesitation in accepting the suggestion.

Mr. Tasker, who was then asked by the Chairman to put his questions to the witness, said he saw from the statement handed in regarding steel-framed buildings that the R.I.B.A. was one of four bodies with the right of appeal under the Act of 1909. Had there been a case of appeal since 1909 made through the R.I.B.A.? Witness said he did not know.

Mr. Tasker: Was it not because of that privilege that the R.I.B.A. sought for rights under the Steel-framed Act of last year? Witness: I am afraid I cannot answer that. As one of the principal bodies engaged in constructional work, we have always endeavoured to safeguard our interests under all the Acts. We took the same steps under the 1926 Act that we have always taken.

Mr. Tasker: Did you submit one single proposal to help or criticise the L.C.C. regulations? Witness: A Joint Committee was formed with other bodies, and we were associated in the action taken to endeavour to amend the proposals of the L.C.C.

Mr. Tasker: I suggest that the Institute have never shown any activity in this matter except to try and have the right of appeal in certain clauses.

Witness: These four bodies dealing with constructional matters certainly did have before them the regulations provided by the L.C.C., and they certainly took steps to have those regulations amended in the direction they desired. I understand they achieved their object to a very great extent.

The Chairman said he must ask Mr. Tasker to confine his questions to matters relating to the Bill.

Mr. Tasker said he considered these questions did relate to the Bill.

Dr. Watts: These questions are entirely irrelevant, and have nothing whatever to do with the registration of architects, but are a purely domestic quarrel between Mr. Tasker and the R.I.B.A.

The Chairman (to Mr. Tasker): I must rule that these questions cannot be asked, and that you must confine yourself to pertinent questions regarding the Bill.

Mr. Tasker: Far from being hostile to the Institute, I want to prevent a very unfortunate position arising between them and the greatest local authority in the world.

Mr. Tasker then went on to deal with the question of district surveyors, and said that according to the calendar of the R.I.B.A. they had passed five men since 1923, although fifteen had been wanted by the L.C.C. He would like to ask witness whether the R.I.B.A. were going to accelerate these examinations or put the L.C.C. in the undignified position of holding the examinations themselves.

Witness said the position was that in 1919 they advertised an examination; there were no candidates and no examination was held. In 1920 they advertised twice with the same result. Those, however,

were very exceptional years. In 1921 they examined two men; in 1922, three men; in 1923, one man; in 1924, one man; in 1925, three men; and in 1926, ten men. They could do no more than advertise the examination and hold it; they could not compel candidates to present themselves. They had issued special notices in their journal with regard to the examination, and had done everything to bring these posts to the notice of people.

Mr. Tasker: According to your calendar, no one was examined in 1923, 1924, or 1925. Witness: In 1923 what happened was that an examination was held, and one candidate presented himself but did not pass. That is why his name does not appear in the calendar. In 1924 the same thing happened. In 1925 we held an examination and one man passed. Two district surveyors were examined that year; one passed and one failed. There is no entry in the calendar, and in that respect the calendar is deficient in information.

Mr. Tasker: Do you not realise my difficulty when you very kindly send us a calendar and I turn it up and cannot verify information?

The Chairman: How long are these questions going on?

Mr. Tasker: I will not ask any more questions.

Mr. Hirst: I want to say that I think this is very improper. Mr. Tasker is only refusing to ask any more questions because he is smarting under an injustice from the chair. We do not want that sort of impression.

The Chairman: Neither do I.

Mr. Gardner, M.P.: I want to elucidate a point with regard to one of Mr. Tasker's questions. Is there any reason why so few people are willing to come forward for these examinations?

Witness: I think there may be one or two reasons. First of all, the district surveyor is not allowed to have a private practice, and that may have an effect on young, ambitious men. There has also been a certain amount of uncertainty in late years as to the retirement of district surveyors, and their tenure of office has been prolonged from time to time, with the result that the prospects of vacancies have not appealed to candidates. The increase in the number of candidates in 1926 was due, I believe, to some changes made in that respect.

Sir Murdoch Macdonald, M.P.: Is it likely that there has been objection to the strenuousness of the examination? Witness: I cannot say.

Mr. Hirst: Is this the only channel through which the services of these district surveyors are secured?

The Chairman again invited Mr. Tasker to put questions.

Mr. Tasker: I do not wish to say anything more.

Before the Committee adjourned, Major Barnes said that since the last meeting of the Committee the negotiations with Northern Ireland and the Ulster Institute had come to a satisfactory conclusion, and it was now desired that Northern Ireland should be included in the Bill.

The Committee then adjourned until Tuesday afternoon.

WESTMINSTER, Tuesday, May 24.

When the Committee resumed its sittings on Tuesday of this week, evidence was given by Mr. Norman Scorgie and Mr. Edward Willis, on behalf of the Institute of Municipal and County Engineers, and Major Barnes continued and completed his statement on behalf of the Royal Institute of British Architects.

Mr. Scorgie said they were more particularly concerned with the amendment of Clause 20, which had been agreed to by the Royal Institute of British

Architects. This amendment was not only desired by the Institution, but also by associations representing Local Government authorities. Its inclusion would render it unnecessary for such bodies to consider the necessity of tendering evidence on matters of detail.

The Chairman: If the clause is amended as suggested, that will meet your point?

Mr. Scorgie: Yes. The R.I.B.A. have promised us that. I would also like to call attention to Clause 5 (1) (c). As it reads at present, it does not meet our case. We have in our profession many men who were educated as architects but who have now municipal appointments. We suggest that if these individuals desire to go back to their first love they should have an opportunity of doing so. The clause should be amended to include those persons who have been in *bona-fide* practice as architects prior to the passing of the Act but who, having relinquished such practice at any time, may desire to resume it later.

In reply to a question as to whether an amendment to Clause 5 had been drafted by witnesses, Mr. Willis replied that this had not yet been done.

The Chairman said it would be a convenient course that an amendment should be drafted and handed in. Then the R.I.B.A. could be asked whether they agreed with it or not.

Captain Wallace: Can Mr. Scorgie say what number of his people have been architects?

Mr. Scorgie: I am afraid we cannot. I can only say how many members of our Institution are practising as public officials. There are over a thousand.

Captain Wallace: How many members of your Institution are members of the R.I.B.A.?

Mr. Willis: About 50, I think.

Mr. Gardner: What are your claims based upon. Is it by virtue simply of carrying out municipal work?

Mr. Willis: A number of the men have been articled to an architect, but have taken on municipal work. In my own case I was articled to a principal architect in Windsor.

Mr. Lindley: Paragraph 14 says that "Unless the Local Authorities are exempted from the Act they must either abandon the use of the terms 'architect,' 'architectural,' etc., or appoint a registered architect to carry out work of which by far the greater part is engineering, to the exclusion of engineers trained and qualified to do it." If the R.I.B.A. put in the word "Registered," and the Committee decide to accept that phrase, surely that cuts the ground from under paragraph 14?

Mr. Scorgie: I am quite prepared to admit that it does to an extent. None of us want to use the words "registered architect" unless we are on the register.

Mr. Lindley: Does not that destroy the contention you have put forward?

Sir F. Rice: It is contemplated that a charge should be made for registration. Have you prepared a fee for registration?

Mr. Scorgie: If the register is going to be worth having, you must pay for what you get.

This concluded the examination of the two witnesses.

Major Barnes was then examined further. Replying to Sir F. Rice, he said that the R.I.B.A., in so far as it contained a preponderance of British architects, must have a voice in any registration scheme. It was the largest and most important body, and we do not think that because the Institute is entrusted with the control of registration it gives it any advantage in that respect, though a body such as that must exercise a predominating influence.

Sir F. Rice: Do you agree that as a result of the position of the Institute that it should have a voice

as to who shall be registered and who shall not be registered?

Major Barnes: I do not think the Institute has a controlling voice as an Institute unless it forms a policy upon which it can control its members. With regard to the Admission Committee, no such policy can arise. The question in their case must, of course, be whether some particular individual is to be admitted or not. That is a matter that will never be submitted to the Institute as an Institute. They can, therefore, never express an opinion on such a matter or exercise control. In that sense the Institute, as an Institute, has no control.

Sir F. Rice: The majority of that Committee would by their majority have control over the admission or rejection of members.

Witness: I think the R.I.B.A. would never direct its members upon this point. The members of the Committee would exercise their individual judgment on the particular case put to them. The Institute, as an Institute, would have no concern whatever in the election of any individual.

Sir F. Rice: Assuming that to be the case, do you agree that it is the primary duty of this House of Commons Committee to see that whoever is appointed to keep that register should be a reputable body?

Witness: I entirely agree.

Sir F. Rice: You have said that in your opinion the R.I.B.A. are the right people, and in your précis you have given evidence regarding the examinations and control of admission of students in your profession for many years past.

Witness: In that respect we do not differ from any other body. We have never had any control over the entrance to the profession. We have never had examinations for entrance to the profession. We have had examinations for entrance to the Institute. Every body guards its portals from the unworthy.

Sir F. Rice: Do you organise examinations and charge fees?

Witness: A small fee is charged—three guineas.

Sir F. Rice: Do you agree that appointments of £1,700 a year for district surveyors are appointments to be sought after?

Witness: I think the figure £1,700 is too high. We have a letter from the L.C.C. addressed to the Institute on this matter of district surveyors. It was subsequent to the meetings of this Committee, and drew attention to the paucity of candidates and gave a figure of net income of £1,000 a year and not stating the maximum.

Mr. Gardner: These questions are based on the assumption that it is the duty of the R.I.B.A. to find candidates.

Major Barnes said it had never been suggested to the Royal Institute that more than one examination should be held in any one year for the position of district surveyor. If such a suggestion had come from the L.C.C., it would have been acted upon at once. Examinations were announced in the Press, and the Council had taken special steps in the last three or four years to call attention to them. No letter had been received from the L.C.C. prior to May 14, 1927. All the special steps taken were without prompting or suggestions being made. It was done as part of the duty of the Institute. The position was that there were only a limited number of these appointments, and in consequence the prospect of vacancies were very small. It was not like an examination for admission to a profession or to a whole range of appointments. The only result of the examinations was to give candidates a chance of getting one out of twenty appointments which might fall vacant. He did not suppose there was more than one vacancy every year. What had happened was that during the war period a number of district sur-

veyors reached to a time when in a normal way they would have relinquished their appointments, but these appointments were extended from year to year, and there was no certainty that there would be a vacancy. That would have some effect on the men coming forward. When the vacancies occurred they were usually vacancies to the lowest remunerated posts. As far as he could see, there was no reflection either on the Institute or on the L.C.C. The position arose out of the circumstances.

Dr. Watts: The question has been asked whether the R.I.B.A. is the proper body to be entrusted with the register.

Major Barnes: There is no other body.

Mr. Hirst: One gathers from the questions submitted that there has been some difference of opinion as to the policy pursued. May I ask if, in connection with your profession, there is a difference of opinion existing between the L.C.C. and yourselves?

Witness: There are always differences of opinion about matters of detail in the construction of the Building Act.

Mr. Hirst: May I ask if there are acute differences of opinion?

Witness: There is always a sort of natural difference of opinion between those who practise a profession and those who are in any way controlling them. Individual members of the Institute often find themselves differing with the L.C.C. upon points of construction of the Building Acts, but the relations between the Institute and the L.C.C. are very friendly, particularly at the present time. From time to time wider points in individual cases arise, as, for example, when the L.C.C. sets itself to revise the London Building Act, but these points are settled by conferring, the Institute coming forward as their protagonists. But there is nothing in the nature of acute feeling or strained relationship. We have been for some time in communication with the L.C.C. on the question of the London Building Acts amendment, but correspondence shows that there is nothing which in any sense of the word can be called strain between us.

Sir F. Rice: Has the Institute operated in any other County Council or Corporation apart from the L.C.C. in advising and framing by-laws?

Witness: Our advice has been very frequently sought on the matter. Our policy is to unite with the builders in the district in anything of that kind.

Sir F. Rice: Has the Institute always been willing to co-operate and give their advice?

Witness: Always.

Sir F. Rice: Can you describe the functions of an architect?

Witness: I think I have attempted to do so in my precis.

Sir F. Rice: The builders are very much concerned in the control being handed over to the Institute. They want to be quite sure there is no attempt to force on the building trade a form of contract which will not consider all interests concerned.

Witness: On that I think I can give every assurance that no such attempt will be made. So far from adopting an attitude of that kind, the whole history of the Institute is a history of growing consideration and co-operation with the contractor. I am quite sure Sir Frederick will agree that the present form of contract which bears the imprimatur of the Institute is far in advance of the contract which was in evidence thirty or forty years ago. The architect's position is not so absolute as it used to be. At the moment there are conferences going on, not only with the Institute alone, but between the architectural profession, in so far as it can be represented by the Institute, and representatives from other institutions and Government Departments. The conferences have

been for some time endeavouring to arrive at a form of contract which would be mutually acceptable. Nothing in this Bill goes against that.

Replying to another question, witness said there was a very hopeful chance of the conferences proceeding with some dispatch, and he hoped within the next twelve months the industry would be in the happy position of having a contract agreed on between the professional architects on the one hand and the building employers on the other.

Sir F. Rice: What would satisfy me would be an assurance that there will be no further attempt to foist on the building trade any contract they do not like.

Witness: I do not know if "foist" is an appropriate word, but I think you may be quite sure that men of goodwill on both sides are endeavouring to come to an agreement.

The Chairman: I think the point can now be closed. We want to get on.

Dr. Watts: What has the question of contracts to do with the registration of architects?

Sir Murdoch Macdonald: We must not do anything to prejudge the point at issue between the two bodies.

The Chairman: I submit, Sir Frederick, that you have obtained your answer from Major Barnes. I do not think you will get any further information.

Sir F. Rice: I have finished my questions.

Replying to Mr. Hirst, witness said that whatever registration fee applied, it would apply to everybody. The other bodies would also see that the registration fee did not go up.

Mr. Hirst asked for particulars of costs of scholarships.

Witness said the range of cost was very considerable. It started as low as 16 guineas, and rose as high as £344.

Replying to Mr. Lindley, witness said it was difficult to find words to meet the case of a man who was formerly an architect and wanted to practice again. The problem was to find ways and means of allowing such a person to go on the register without opening the door so wide that it would allow anybody to come forward at any time and say "Thirty or forty years ago I was an architect. You must put me on the register." I am very doubtful whether words can be found to give effect to the proposed amendment.

Major Barnes added that it seemed to him an extraordinary thing that people should ask to be allowed to use the term "registered" without being on the register.

The Committee then adjourned.

A new four-light memorial window was unveiled at the Old Ashmolean Building, Oxford, last week, by the Chancellor of the University, Lord Cave. The two larger panels are in memory of Sir Christopher Wren, the designer of the building, and of Elias Ashmole, whose collection, presented to the University, formed the nucleus of the first natural history museum in this country. Mr. E. Guy Dawber, A.R.A., presented the Wren light on behalf of the R.I.B.A., and Mr. Falconer Madan the other on behalf of Brasenose College, of which Ashmole was a member. The two smaller lights commemorate, respectively, Robert Plat, the first curator, and John Tradescant, whose collection of curiosities passed through Ashmole's hands to the museum.

The last section, at Box Hill, of the newly-widened main road from Reigate to Dorking, was opened for traffic last week. The total cost of the work has been about £143,000, of which 50 per cent. has been provided from the Road Fund of the Ministry of Transport.

On the west side, near the north end of Charing Cross Road, once familiar as the old Crosse & Blackwell factory, side by side stand two buildings. One is an office building occupied by the Metropolitan-Vickers Electrical Company (Messrs. F. Taperell & Haase, architects). The other is the Astoria Cinema (Mr. E. A. Stone, F.S.I., architect). Look at them as you pass. The exterior of each building is finished in "Atlas White" stucco. They are quite dissimilar in appearance. To architects interested in this class of work I will be glad to explain the difference and the reasons therefor. Specifications for orthodox "Atlas White" Portland cement stucco may be had from me by all who ask for them ("Colemanoid" made the Astoria Cinema retaining wall waterproof).

Regent House
Regent Street,
London, W.1.

Frederic Coleman

Notes in Brief

The 18th century house, Platt Hall, Manchester, recently preserved from destruction, was opened last Monday by the Lord Mayor of that city as a branch art gallery and museum, in which has been housed the fine collection of modern pictures presented to Manchester, in 1925, by Mr. Charles Rutherston. In addition to the Rutherston collection, the Phillips collection of Wedgwood Ware, some Epstein sculptures and other works have also found a home there.

* * *

At a recent Diocesan Conference, the Bishop of Liverpool outlined a scheme to celebrate the jubilee of the diocese, in 1930, by raising a fund of £200,000 for the erection of new churches, for completing others, and for the provision of parochial halls in various places.

* * *

A sum of £20,000 has been offered by an anonymous donor to make Farnham Castle a permanent centre of Church activity, the intention being that it shall be used as a place for retreats, conferences, schools of clergy, missionary schools, and a home for the Lyttelton Library. The announcement was made at a recent Winchester Diocesan Conference by Dr. Randolph, the retiring Bishop of Guildford, whom the donor of the fund suggests should become warden of this new Church settlement for the first five years.

* * *

The west front of Belfast Cathedral, which is to form a War Memorial, is now almost completed, and will be dedicated early next month by the Irish Primate. The front has been carried out from plans by Sir Charles Nicholson, embodying the main features and ideas of the design left by his predecessor, the late Sir Thomas Crew.

* * *

Mr. S. E. Winbolt has reported the discovery of six early Roman burial urns on the farm of Mr. Batchelor, Greatham, Sussex, by workmen digging for sand. It is thought that the site was probably a burial field, and confirms to some extent the theory that a Roman road ran west to east from near Hardham Camp through Greatham.

* * *

To celebrate the 13th centenary of the Christian faith in Northern England, the Archbishop of York has launched an appeal for about £50,000 for repairs to York Minster. About £15,000 is needed to complete the preservation of the mediæval glass in the Chapter House and elsewhere; about £30,000 for general fabric repairs to the central tower, choir, Lady Chapel, and roofing; and about £6,000 for improving the heating arrangements of the Minster.

* * *

Under the auspices of the Midland Joint Town-planning Advisory Council, constituted in July, 1923, a Regional Planning Exhibition and Conference will be held at the Town Hall, Birmingham, from June 20 to 24, inclusive. A feature of the exhibits will be illustrated maps and models. Mr. Neville Chamberlain, Minister of Health, will open the Conference at 2.30 p.m. on the first day. Ten papers will be read, the first of which, by Mr. G. L. Pepler, Chief Town Planning Inspector, Ministry of Health, will deal with "Objects and Advantages of Regional Planning."

* * *

Excavations in the "Mob" Quadrangle at Merton College, Oxford, to locate the site of the old Church of St. John the Baptist, believed to have been erected in Saxon or Norman times, have revealed the existence of two sets of foundations under the north wing of the college, also, close by, the remains of a stone chamber of uncertain character and purpose.

Competitions Open

Closing Date, June 15.

Layout and architectural treatment of approaches to the Palais de Justice, Brussels. Particulars, M. Le Conservateur du Palais de Justice, Brussels.

Closing Date, June 15.

Shakespeare Memorial Theatre Preliminary Competition. Full review of the competition published in our issue of January 28, 1927. Assessors, Messrs. Robert Atkinson, F.R.I.B.A., E. Guy Dawber, F.R.I.B.A., and Cass Gilbert. Particulars, Secretary, Shakespeare Memorial Theatre, Stratford-upon-Avon. Deposit £1 1s.

Closing Date, July 1.

Edwin Austin Abbey Memorial Scholarships. Particulars, Secretary, Edwin Austin Abbey Memorial Scholarships, Chelsea Lodge, 42 Tite Street, S.W.3.

Closing Date, July 1.

Cemetery Chapel, Reading. Limited to architects residing or practising in Berks, Bucks or Oxon. Premiums, 50 and 25 guineas. Assessor, Mr. Charles J. Blomfield, F.R.I.B.A. Particulars, Borough Surveyor, Town Hall, Reading. Deposit £2 2s.

Closing Date, August 23.

University Buildings, Western Australia. To cost £150,000. Premiums, £400, £300 and £200. Assessors, Prof. Leslie Wilkinson, F.R.I.B.A., Mr. A. R. L. Wright, L.R.I.B.A., President Royal Institute of Architects of Western Australia. Particulars, Agent-General for Western Australia, 115-116, Strand, W.C.2.

Closing Date, not yet fixed.

Grammar School, Bradford, for 1,000 boys. Premiums, £300, £200 and £100. Assessor, Mr. Arnold Mitchell, F.R.I.B.A. Particulars, Mr. W. Brear, Secretary, Grammar School, Bradford, Yorks. Deposit £1 1s.

Coming Events

Royal Institute of British Architects.—On May 30. General Meeting. "Devonshire House Buildings." Mr. Thomas Hastings (H.C.M.).

The Surveyors' Institution.—On Tuesday, May 31, at the Zoological Gardens, Regent's Park. Afternoon Reception.

L.C.C. Central School of Arts and Crafts, Southampton Row.—From June 1-30. Exhibition of Students' Work.

Royal Academy of Arts.—In Westminster Abbey on Thursday, June 2. The Annual Service for Art. 5 p.m.

Institution of Municipal and County Engineers.—On Thursday, Friday and Saturday, June 2 to 4. Meeting of the Institution to be held in the Scottish District at Dunfermline.

Royal Institute of British Architects.—The Exhibition of Modern British Architecture in the R.I.B.A. Galleries will be open daily (Sundays excluded) from 10 a.m. to 6 p.m., until Friday, June 3.

Town Planning Institute.—On June 10, at 5.30 p.m., in the Caxton Hall, Caxton Street, Westminster. The Thirteenth Annual Meeting.

The Institution of Municipal and County Engineers.—On June 15, 16, 17, 18 at Torquay. General Meeting and Conference.

Royal Institute of British Architects.—On June 20. Election of Council and Standing Committee. Election of members.

Royal Institute of British Architects.—June 20-25. British Architects' Conference, London.

Cement Marketing Company, Limited.—On Tuesday, June 28. Visit of members of Institution of County Engineers to the Kent Cement Works, Greenhithe.

MARSEILLES ROOFING TILES

One great feature about Marseilles Tiles is that they weather rapidly and delightfully and they acquire a variegated, mottled appearance. We should be pleased to send you a Draft Specification and a sample tile.

London Building Notes

ALDERSGATE.—Extensive alterations are to be carried out to the "Raglan" Hotel, in Aldersgate, E.C.1. The builders are Messrs. J. S. Vivian & Co., 20 Saxon Road, E.3.

Bow.—The Governing Committee of St. Andrew's Hospital have decided to erect a new nurses' home at their institution, on a site in Devons Road, Bow, E.3. Plans have been prepared by Mr. Harley Heckford, M.Inst.C.E., architect and surveyor, High Street, Poplar, E.14.

CAVENDISH SQUARE.—Extensive alterations are being effected to corner premises in Cavendish Square, W.1, prior to the opening of a branch bank by Messrs. Coutts & Co. The contractors are Messrs. John Greenwood, Ltd., 12 Arthur Street, London Bridge, E.C.3.

CHEAPSIDE.—Steelwork is now being placed in position upon the site of Nos. 97-99 Cheapside and 31-33 Lawrence Lane, E.C.2, for the new office and shop premises which are to be built to the design of Messrs. Robert Angell & Curtis, architects, 133 Regent Street, W.1. The builders are Messrs. George L. Wallis & Son, Ltd., London and Maidstone. Armoured tubular floors will be used.

CITY.—A new office block, to be known as Ivy House, is to be erected at the corner of Ivy Lane, E.C.1. Excavations for foundations are being carried out by Messrs. B. Goodman, Ltd., 88 Haggerston Road, E.8. The building will be erected by Messrs. Griggs & Son, 100 Victoria Street, Westminster, S.W.1., to the designs of Messrs. Trehearne & Norman, architects, Windsor House, Kingsway, W.C.1.

DRURY LANE.—A large site, having an area of 10,000 square feet, in Macklin Street, Drury Lane, W.C., has been sold for £11,675. The new owners intend to build a garage, etc., upon the land. The surveyors are Messrs. Waite & Waite, Great Castle Street, W.

FINCHLEY.—A meeting of the parishioners of St. Mary's Church, Finchley, N., have approved plans for the extension of the Parish Church. The proposed alterations include the addition of transepts and the lengthening of the chancel, raising the east window, and the enlargement of the organ chamber. The Rector is the Rev. Stewart Bernays. The architect is Mr. W. Weymouth, F.R.I.B.A., 104 High Holborn, W.C.

FLEET STREET.—Negotiations are being concluded by the Merchant Taylors' Company and private interests for the letting of the site known as No. 125 Fleet Street, E.C.4, on building lease for 99 years from June 24. The lessee undertakes to expend at least £15,000 on building operations. Arrangements are in the hands of Mr. C. R. H. Hardecastle, 11 Copthall Court, E.C.2.

GRAY'S INN ROAD.—The 99th annual report of the governors of the Royal Free Hospital in Gray's Inn Road, W.C., states that it has been decided to celebrate the centenary of the hospital by erecting a children's ward. It is proposed to add other additions and

to develop adjoining property, comprising an area of about one acre. Funds are to be raised to the extent of £200,000 to enable the work to be put in hand. The architects are Messrs. H. V. Ashley & Winton Newman, F.R.I.B.A., 14 Gray's Inn Square, W.C.1.

LAMBETH ROAD.—The "Old Vic." Theatre in Lambeth Road, S.E.1, has closed down for reconstruction purposes, the present work being the second and last section of a larger scheme. A large vestibule is to be provided, and the interior refurnished and decorated. The architects are Messrs. Frank Matcham & Co., 9 Warwick Court, High Holborn, W.C.

LEICESTER SQUARE.—Messrs. H. J. Greenham, Ltd., Warton Road, Isleworth, are now excavating upon the site in Leicester Square, W.1, of the old Empire Theatre, upon which is to be built, at a cost of £750,000, the new cinema and restaurant for the New Empire, Ltd. The builders are Messrs. F. B. Huntington, Ltd., Broadway Chambers, Hammersmith, W., whilst the architects are Messrs. Frank Matcham & Co., 9 Warwick Court, Holborn, W.C. The consulting engineer is Mr. S. W. Budd, M.Inst.C.E., Broadway Chambers, Hammersmith, W.

MARBLE ARCH.—The sub-committee of the Theatres and Music Halls Committee of the L.C.C. have granted a licence for a cinema to be built at Marble Arch, W., to be known as "The Regal." Plans have already been approved, the new building being estimated to accommodate 3,500 persons, at a cost of £250,000. Demolition of buildings occupying the site is now being undertaken by Messrs. Charles Abrahams & Co., 1, Wedmore Street, N.19. The theatre will be erected by Messrs. F. G. Minter, Ltd., Ferry Works, Putney, under Mr. Clifford Aisle, Bedford Street, Strand, W.C., acting for Regal Cinema, Ltd.

MARYLEBONE ROAD.—Work has commenced upon the rebuilding of Madame Tussaud's Exhibition, the cost of which, including a new cinema, will be £100,000. The builders are Messrs. Humphreys, Ltd., Knightsbridge, S.W., the steelwork contract being placed with Messrs. Moreland, Hayne & Co., Ltd., 80 Goswell Road, E.C.1. The demolition work is being carried out by Messrs. H. Sabey & Co., Ltd., South Wharf, Paddington, W.2. The architect is Mr. F. E. Jones, Gloster Mansions, Cambridge Circus, W.C.2.

OXFORD STREET.—Alterations and improvements, including new shop fronts, are to be made to the premises at No. 155 Oxford Street, W.1, under the supervision of Messrs. Waite & Waite, surveyors, Great Castle Street, W.1. The contractors are Messrs. George Parnall & Co., Ltd., Langham House, Regent Street, W.1.

OXFORD STREET.—The first portions of steel framework are being made by Messrs. Dorman Long & Co., Ltd., Central Buildings, Westminster, S.W.1, for the new "Corner House" Restaurant to be built for Messrs. J. Lyons & Co., Ltd., upon the site at

the corner of Oxford Street and Tottenham Court Road, W.1. The terra-cotta faience will be supplied by the Leeds Fireclay Co., Ltd., Leeds, at a cost of £10,000. The architect is Mr. F. J. Wills, F.R.I.B.A., 62 Oxford Street, W.1.

PICCADILLY.—Demolition of the premises of Messrs. Fortnum & Mason, Ltd., at the corner of Piccadilly and Duke Street, W.1, is now in hand, the work being undertaken by Messrs. Henry J. Greenham (Demolition and Excavation), Ltd., Warton Road, Isleworth. A complete scheme of rebuilding—to be carried out in sections—has been planned by Messrs. Wimperis, Simpson & Guthrie, F.R.I.B.A., 60 South Molton Street, W.1. Work on the Piccadilly frontage will be shortly put in hand.

PUTNEY.—It is announced by the Joint Committee of the Church Training Colleges Capital Fund of the Church of England that the plan for the proposed new Whiteland Training College at Putney, S.W., are now under the consideration of a small sub-committee. The cost of the building will be about £100,000. The architect is Sir Giles Gilbert Scott, R.A., Gray's Inn Square, W.C.

REGENT STREET.—A large extension is to be made to Dorland House, Regent Street, W.1, for the owner, Mr. George W. Kettle. The new building will be of ten floors and has been designed by Mr. J. J. Joass, F.R.I.B.A., 40 St. James's Place, S.W.1. The builders are Messrs. Bovis, Ltd., 43 Upper Berkeley Street, W.1, whilst the steelwork will be supplied by Messrs. Moreland, Hayne & Co., Ltd., 80 Goswell Road, E.1.

SURBITON.—A new branch bank is being erected at the corner of Claremont Road, Surbiton, for Messrs. Lloyds Bank, Ltd., Lombard Street, E.C.3. The builders are Messrs. A. C. Walder & Co., 49 Lower Richmond Road, Putney, S.W.15.

WESTMINSTER.—The L.C.C. have agreed, so far as the London Building Act, 1894, Height of Buildings, concerned, to approve the plans for the new "Windsor Castle" public house, to be built at the corner of Milton Road and Vauxhall Bridge Road, S.W.1. The new building, which will include a large restaurant, has been designed by Mr. G. G. Marfalan, surveyor to Messrs. Watney, Combe, Reid & Co., Ltd., Stag Brewery, S.W.1.

WIGMORE STREET.—Alterations, including the fitting of new shop display windows and equipment, are to be carried out at No. 22 Wigmore Street, W.1. The contractors are Messrs. Pollard & Co., Ltd., St. John's Street, Clerkenwell, E.C.1.

WHITECHAPEL.—The governors of the Whitechapel Educational Foundation propose to grant an 80-year building lease of a piece of land in Old Montague Street, E., between No. 16 and Royal Place, with a frontage of 144 ft., the lessee undertaking to expend £10,000 on building work. The matter is in the hands of Mr. T. I. Metcalfe, 124 Minories, E.1.

The Development of an Ideal in Craftsmanship

Early XIII-century Ship showing primitive forecastle, sterncastle and fighting tops.

CRAFTSMANSHIP — whether in Ships or Switches—can never be said to find its ultimate expression, for the law of evolution is as immutable in industry as in the realms of Nature.

Yet fundamental principles are constant, and it is interesting to note how the primitive forecastle and fighting top in the XIII-century ship still survive in the fo'c'sle and central fire-control station of the modern super-Dreadnought.

So with Electrical Switches—fundamentals will always remain, but the spirit of progressive Craftsmanship continually builds improvements on them to meet the needs of to-day and thus also those of to-morrow.

"Craftsmen in Electrical Switches."

The Week's Building News

The following abbreviations are used: U.D.C. for Urban District Council; T.C. for Town Council; R.D.C. for Rural District Council; E.C. for Education Committee; B.G. for Board of Guardians; P.C. for Parish Council; B.C. for Borough Council; M.H. for Ministry of Health; M.T. for Ministry of Transport; C.B. for County Borough; B.E. for Board of Education. Direct confirmation should be obtained before commitments, for which we cannot be responsible, are made.

ALDRIDGE.—Mr. Holland W. Hobbs, A.R.I.B.A., of Birmingham, has been appointed to act as assessor in connection with the scheme for the erection of a Memorial Hall.

BRECON.—A Masonic Temple is to be erected at Brecon. The architect is Mr. W. E. Gething-Leyshon, Dorlangoch, Brecon.

BARNET.—Mr. J. W. Fisher, F.R.I.B.A., of Wellingborough, is the architect, and Messrs. R. Ginn & Son, of Hertford, the builders, of a new Girls' Grammar School at Barnet.

BARNESLEY.—Plans are being prepared for new elementary schools and central schools to be erected at Brampton, near Wath, Yorkshire. The architect is Mr. C. F. Moxon, of Regent Chambers, 3 Regent Street South, Barnesley.

BIRMINGHAM.—Birmingham E.C. propose to complete the erection of the Billesley Council School by the building of an infants' department on open-air lines, at a total cost of £12,055. The school has been planned by Mr. H. T. Buckland, of Norwich Union Chambers, Congreve Street. The contract will be placed with Mr. Francis H. Smith, of 418-420 Mosley Road, Birmingham.

BIRMINGHAM.—Extensions are proposed to premises in Alma Street, Birmingham. The architects are Messrs. Riley & Smith, 115 Colmore Row, Birmingham. The building contract has been let to Messrs. Whittalls, Lancaster Street, Birmingham.

BIRMINGHAM.—The committee of the Birmingham Church Extension Fund have decided to erect two halls on the Dads Lane estate and the Witton Lodge estate. The Witton Lodge scheme is now going forward, the contract having been placed with Messrs. Dare & Sons, contractors, of Ward End, Birmingham. The architect is Mr. S. A. Wigham, of Drew's Lane, Washwood Heath, Birmingham.

BLACKPOOL.—The architect for the proposed Memorial Hall and Sunday School for the South Shore Parish Church, Blackpool, is Mr. A. A. C. Moore, of 19 Abingdon Street, Blackpool.

DOWNHAM.—The L.C.C. E.C. have approved plans for a school building at Downham, estimated to cost £35,000.

DURHAM.—Elementary schools are to be erected at Brandon Blackhall Colliery, Fishburn, Nettleworth, Seaham Harbour, New Seaham, Rydon, Unsworth Colliery, West Auckland, and Wellfield, for the E.C., at an estimated cost of £146,163. The architect is Mr. F. Willey, F.R.I.B.A., 34 Old Elvet, Durham.

GLASGOW.—The Scottish National Housing Commission Trust, Ltd., has been instructed by the Government to proceed with the erection of 1,000 steel houses in the middle and western districts of Scotland.

KEARSLEY.—Improvements are to be made at the "Three Crowns"

public-house, Kearsley, near Farnworth. The plans have been prepared by Mr. S. Metcalfe, architect, Ellesmere Street, Hulme, Manchester.

LEEK.—The R.D.C. approved a layout plan for 15 proposed new houses, with self-contained sewerage disposal provision, for Mr. P. Ball, at Longsdon.

LEICESTER.—The scheme for the rebuilding of the Grand Clothing Hall, Cheapside, has been planned by Mr. C. B. Pearson. The general contract has been placed with Messrs. J. Parkinson & Sons, of Parliament Street, Lancaster.

LEYBURN.—Mr. C. Cradock, of Wensley, Leyburn, is carrying out the foundations and brickwork on the erection of a new cinema at Leyburn. Planned by Mr. Albert P. Haigh, A.L.A.A., of 2 St. Mary's Place, Barnesley, the building is of stone and brick construction, to seat 400 people. The steelwork contractors are Messrs. Dixon, Powner & Sons, Rockingham Street, Leeds.

LIVERPOOL.—Messrs. Rees & Holt, architects, of 64 Rodney Street, Liverpool, are preparing plans for a big extension and improvement scheme to the Wallasey Victoria Central Hospital, the cost of which is estimated at about £20,000.

LIVERPOOL.—New schools and a parochial hall are to be erected in Earle Road, Liverpool. The plans are being prepared by Messrs. Foden, Hemm & Williams, architects, of Century Buildings, 199 Deansgate, Manchester.

MANCHESTER.—Mr. A. V. Roberts, architect, 113 Great Cheetham Street, West Broughton, Manchester, is preparing plans for the erection of eight garages and a store and nine garages at Oswald Road and Nicholas Road, Chorlton-cum-Hardy. The first contract has been let to Messrs. H. Davies & Sons, contractors, Great Cheetham Street West, Higher Broughton, Manchester.

MANCHESTER.—Messrs. Williams Deacon's Bank, Ltd., 38 Mosley Street, Manchester, are to erect a branch on a site having frontages to Piccadilly and Gore Street, Manchester. The architect is Mr. F. Fowler. No contracts have yet been placed.

MANCHESTER.—Twelve lock-up garages are to be erected in Waterloo Road, Cheetham. Plans have been prepared by Messrs. Leach & Radcliffe, 7 Cheapside, Manchester. The roof will be covered with Turner's asbestos tiles.

MANCHESTER.—Extensive alterations are to be made to 7 and 9 Upton Street, and Foulkes Court, Manchester. The plans are being prepared by Mr. F. Fenn, architect and surveyor, 1 North Parade, Deansgate. Quantities are now being got out. No contracts have been placed.

MANCHESTER.—The Parochial Church Council of St. Peter's Church, Barlow

Road, Levenshulme, Manchester, are proposing to make extensions to the Sunday School. The plans have been prepared by Mr. F. Fenn, architect and surveyor, 1 North Parade, Manchester.

NEWCASTLE.—A scheme is proposed for the erection of a new parish hall for the Byker Parish Church. The total cost is estimated at £10,000. Mr. C. F. Murphy, Lloyds Bank Chambers, Morpeth, has been appointed as architect.

NEWCASTLE.—Extensive alterations and additions are to be made to the Grainger Hotel, in Westmoreland Road. The architects are Messrs. Marshall & Tweedy, 54 Grey Street, Newcastle-on-Tyne.

NEWPORT.—The plans of Mr. Noel D. Sheffield, F.R.I.B.A., F.S.L., of 18 St. Thomas's Street, London, S.E.1, for extensions to the Newport (Salop) Grammar School, have now been approved. The scheme is estimated to cost about £9,100.

NEWPORT (MON.).—A large institute is to be erected by the directors of John Lysaght, Ltd., at a cost of £20,000. Plans have been prepared by Messrs. Johnson & Richards, Newport, Mon.

PLYMOUTH.—Plans have been approved by the B.C. for a lecture hall at Durnford Street, Stonehouse, Plymouth, for Rt. Rev. Bishop J. Keily, of Plymouth. The architect is Mr. Lionel F. Vanstone, 15 Old Town Street, Plymouth.

RICKMANSWORTH.—The governors of the Royal Masonic Institution for Girls, at Clapham Common, S.W., have purchased the Rickmansworth Park estate, where it is proposed to erect a new senior girls' school, at a cost of about £100,000. Arrangements are in the hands of Mr. A. Burnett Brown, Grand Master of Works, Freemasons' Hall, Great Queen Street, Kingsway, W.C.

SOUTH SHIELDS.—The license in connection with the proposed new hotel and hall at Harton, for Mr. G. G. E. Lamb, of Newcastle, has now been confirmed. The estimated cost is £20,000. The architect is Mr. F. W. Newby, 37 King Street, South Shields.

STRATFORD-ON-AVON.—The Warwickshire E.C. propose to make extensions to the Grammar School, including the erection of six classrooms, estimated to cost £20,000.

THETFORD.—The Corporation have approved plans submitted by Mr. H. Bulkeley Creswell, F.R.I.B.A., 3 Plowden Buildings, Middle Temple, E.C.4, for the layout of the Redcastle building estate, Thetford.

TORQUAY.—The E.C. have asked Mr. Widdows, architect, to prepare plans for improvements and extensions at the Homelands Central School.

WARRINGTON.—The Salvation Army propose to erect a new main hall, in the form of a citadel, in Buttermarket Street. The entire scheme is estimated

Building News in Parliament

The Landlord and Tenant Bill (known as the Leasehold Bill) is having so difficult a passage in the Standing Committee that it is becoming doubtful whether it will reach the Statute Book during the present session. This Government measure, which provides for the payment to tenants of compensation for improvements and goodwill in connection with business premises, is in charge of the Home Secretary. A great number of amendments have been tabled by the Opposition, and, up to the present, very little progress has been made. The Home Secretary felt constrained (in view of the many amendments which have been put on the order paper) to remind the Committee that what they have to consider is whether a landlord has received any benefit for which he should pay. This may lead to "hard cases" among tenants, as, for example, where a man makes an improvement on the premises but cannot get anything from the landlord because the building is to be demolished and the landlord will receive no eventual benefit. A landlord is not required to pay for improvements which have not really put money into his pocket.

A statement of some interest, in regard to the powers which local authorities are entitled to claim to control the designs of buildings within their areas, was made by the Minister of Health, in reply to a question by Viscountess Astor. He stated that the Bath Council obtained such powers in 1925, but they have not yet set up an Advisory Committee, pending the settlement of new by-laws. Oxford has not yet obtained such powers, but they propose to do so in connection with their new town-planning scheme. The Ruislip-Northwood Council, under their town planning scheme, may require alterations in the elevation of local buildings, and, if a dispute takes place, the matter is to be settled by an arbitrator appointed by the President of the Royal Institute of British Architects.

The National Physical Laboratory

(Continued from page 902)

Hart, Son, Peard & Co., Ltd., London (wrought-iron grates); Messrs. Clark & Finn, Ltd., London (plastering); Messrs. M. H. Heywood & Co., Ltd., London (special laboratory); Messrs. Williams & Williams, Chester (steel sashes).

The general contractors for the sub-station were Messrs. Hedden & Co., Brentford. The sub-contractors include the following: Messrs. Daneshill Brick and Tile Works, Ltd., Basingstoke (bricks); Messrs. French Asphalte Co., London (asphalte); Messrs. G. Paulin, Ltd., London (steel); Messrs. Henry Hope & Sons, Ltd., Birmingham (steel sashes); Messrs. Roberts Adlard & Co., London (slates).

The general contractors for the engineering workshops, maintenance workshops, concrete testing house, canteen, etc., were Messrs. Collinson & Co., Teddington. The sub-contractors include (in addition to those already mentioned for other buildings) the following: Messrs. H. W. Cullum & Co., London (patent flooring); Messrs. G. Wragg & Co., London (steel sashes); Messrs. Falkirk Iron Co., Falkirk, N.B. (iron stairs); Messrs. J. Allen, Sons & Co. (manhole covers); Messrs. J. Tann & Co., London (steel doors); Messrs. Doulton & Co., London (sanitary fittings); Messrs. Siegwart Fireproof Floor Co., London (concrete flats and floors); Messrs. Stuarts Granolithic Co., Ltd., London (grano steps); Messrs. Torbay Paint Co., Ltd., "Novoid," London (waterproofing to concrete); Messrs. R. Gay & Co., London (paint); Messrs. A. & J. Main, London (fences); Messrs. Sloane Electrical Co., London (wrought-iron gates and lamp standards); Messrs. Birmingham Guild, Birmingham (wrought-iron entrance gates to park); Messrs. Farmer & Lisney, London (stone-ware, etc.).

Add for each side bead butt	4d.	4d.	5d.
Doors of hardwood such as oak or mahogany, will cost three times as much exclusive of polishing.			
Staircase.			
1 1/2-in. Deal tread, 1-in. riser, fixed complete per foot super			2/6
2-in. Deal strings, per foot super			2/-
Housing steps to strings each			

The Value of the Colour, Tone, and Texture of English Hand-made Facing Bricks and Roofing Tiles

is recognized throughout the world. Efforts are made almost everywhere to reproduce the charming effects of old English Architecture.

To discriminating Architects these materials are indispensable to enable them to construct buildings which will lead to-day and be objects of admiration for generations to come.

A comprehensive range of Bricks and Tiles is to be seen built up in the showrooms of

SOME MINOR COMPLAINTS

The cutting down of trees in the tracks of the new arterial roads, and the crude and gaunt appearance which these highways often present, through lack of hedge or verdure along their borders, are matters of frequent complaint in the press. It is a subject to which the Minister of Transport has lent a sympathetic ear, but the powers of his Department to apply the obvious remedy appear to be limited. The constant grumble is, however, just a little ungracious. We confess to being as rabid as anyone in our hatred of unnecessary tree cutting; but it is inevitable that trees which come in the direct path of a new arterial road must be felled out of the way. We have seen two suggestions put forward for avoiding this painful duty; one advocates the roadway being diverted round any interesting group of trees and the other would preserve the trees in the line of the roadway and pass the traffic on either side of them. Such suggestions do more credit to the hearts than the heads of tree lovers, and show small appreciation of the purpose of the arterial roads and the necessity, if they are to be made, of contriving that they shall be as straight and unimpeded as circumstances will permit. Mr. C. R. Ashbee has been complaining rather forcibly to *The Times* about the wanton and indiscriminate felling of trees and the consequent impoverishment of the attractions of the country side. It is a question upon which many other people feel equally strongly. Time was when the speculative builder's first work, in starting to develop a piece of land, was to cut down every tree and shrub upon it, apparently on the principle that, until the place was as bare as a billiard table, it was impossible for him to see his way clearly to start building operations. In those high and far-off days of industrial prosperity, no one seemed to trouble very much; the destruction of all existing verdure was accepted as part and parcel of a building development scheme. So far as the speculator was concerned, all the vegetation that a self-respecting citizen could possibly need was represented by a privet hedge and two "mop" acacias in the front garden, and by such flora as the citizen, himself, could raise on the stratum of brickbats left at the back. Nowadays we are not so complaisant. The threatened destruction of well-grown timber speedily evokes protests, of which the "developers" are beginning to take heed; the more enlightened of them now even take the trouble to preserve some of the sylvan surroundings, charging the house-owners a little bit more for the amenity in question.

Town-planning authorities would do more, doubtless, if they could, but their powers, as Mr. W. R. Davidge points out, are extremely limited. They can schedule particular trees or clumps of trees for preservation, subject to compensation to the owners. The preservation of anything in the nature of a landscape is, with their present powers, a most difficult matter, only to be settled by agreement and co-operation with the landowners concerned. Mr. Davidge would debar the felling of any tree of more than, say, twenty years growth unless a definite licence had first been obtained from the local authority, but he admits that such a drastic course of action is, at present, impossible. It might also conflict with legitimate forestry operations. Possibly some such scheme as that of the "Men of the Trees," demanding the planting of a sapling for every tree cut down, would be a more feasible proposition.

Another minor matter, connected with roads and development which is said to be causing the postal authorities some concern, is the absence on many new housing schemes and developed estates of either letter boxes or numbers to the houses. Some form of compulsion may become necessary to ensure that the postmen can discharge their duties with reasonable promptitude. At present much time is wasted in the delivery of letters through having to enquire from door to door, in some cases, to ascertain the abode of a particular addressee.

The last minor matter concerns the amenities of a new and important thoroughfare in London. Doubtless, those who frequent Kingsway have noticed during the past few weeks the appearance of advertisements all along the railings of the stairways to the underground tram stations, and also along the railings of the sloping approach road of the trams at the junction of Southampton Row and Theobalds Road. The Westminster City Council have formulated a protest against this "setting up of trade advertising stations as a permanent feature at intervals along the middle of an imposing thoroughfare such as Kingsway," which they aver "lowers the tone of that thoroughfare and is detrimental to the property abutting on it." It is disappointing, when trade firms are beginning to mend their ways in advertising matters, to find the London County Council setting such a bad example; and not even the parlous state of the tramway finances can justify this desperate expedient to increase the tramway revenue by vulgarising a fine street of the County Council's own creation.

Notes and Comments

The Danish Architects' Farewell

The visit of a party of Danish architects to London, arranged by the Architectural Association in connection with the Exhibition of Danish Architecture at Queen's Square, concluded on Friday last, when the Association gave a dinner in their honour at Bedford Square, which was followed by a costume ball in the R.I.B.A. Galleries at Conduit Street. In spite of a pretty strenuous week of sight-seeing, which included visits to Bath, Hatfield House, Hampton Court, Richmond, an extensive tour of London, and a trip through Surrey scenery to see Frensham, as an example of yet unspoiled English country-side, our Danish visitors were more than equal to the final dance, in which these architectural representatives proved as expert as the majority of their countrymen, for dancing is a very popular recreation in Denmark. We were privileged to meet a number of our Danish confrères, and they all expressed themselves as greatly delighted with their visit, having been much interested in all that they had seen. The A.A. dinner brought together many well-known English architects to do honour to the occasion. Among them we noticed Mr. E. Guy Dawber, A.R.A., Sir Giles Gilbert Scott, R.A., Mr. Thomas Tait, Mr. Stanley Hamp, Mr. C. F. W. Denning, Mr. C. H. James, Mr. Gilbert Jenkins, Mr. Louis de Soissons, Mr. Chalton Bradshaw, Mr. P. D. Hepworth, Mr. Edward Maufe, Mr. L. H. Bucknell, Mr. Howard Robertson, and Mr. Charles Marriott, the art critic. Mr. J. Alan Slater, the President of the A.A., in a genial valedictory speech, apologised for our native insularity, which left us ignorant of our visitors' language; and found consolation in the fact that the English architect was on much the same footing as his confrère in Denmark where, so he was informed, architects were paid rather less than bricklayers. A word must be said in praise of the organisation and arrangements made for the entertainment of the visitors by Mr. Yerbury, the A.A.'s indefatigable secretary, to whose efforts the success of their visit was mainly due.

Limitation of Height

At a time when land speculators are continually urging the necessity for higher buildings in London and our other large cities, more, it may be suspected, in their own interests than those of the community, Mr. Thomas Hasting's statement, at the R.I.B.A. on Monday, of what is happening in New York, may well be laid to heart. Fifth Avenue, once the principal residential street, is being torn down for commercial "skyscrapers." "The wastefulness of this destruction of modern and usable buildings has been and continues to be appalling, and, in all probability, would never have happened if we had enacted reasonable laws restricting the height of buildings." "I sincerely hope your city will never be inflicted with that disease of high buildings which has so completely revolutionised the city of New York, with consequent demoralisation to circulation and inter-communication by way of the city streets, underground tunnels, and overhead elevated roads, all of which, at the present time, are taxed far beyond their normal capacity; and it is becoming increasingly evident that unless something is done to limit the height of buildings and ensure the growth of the city horizontally rather than vertically, the traffic conditions will become hopelessly involved." Present traffic conditions in London can hardly be described as ideal, and remembering the "rush hour" conditions on our underground railways, and the fact that the average width of New York streets is that of our widest one, Portland Place, it is a question whether the present limitation

on the height of London buildings does not err on the generous side.

Old Masters

A rather interesting little controversy has arisen in *The Times* over the incursion of the scientist into the ranks of the judges of old paintings. It is apparent, however, as Dr. A. P. Laurie suggests, that when the aforetime experts are in doubt, a dispute over the authenticity of a reputed old master can often be settled authoritatively by enlisting the services of the chemist and the X-ray expert. For the modern faker of old masters is a man of no mean ability; and he is the product of conditions arising out of the more skilful and analytical art criticism that came into existence two or three decades ago. A first-hand acquaintance and prolonged study of authentic works armed the progressive critic of those days with a profound knowledge of the brushwork, the pigments, and the more intimate details of execution of a particular master, and enabled him to speak with authority when a work of disputed attribution was submitted to him. But as such critics put reasons for their views and deductions upon paper, it was inevitable that the forger should avail himself of this accumulated knowledge, and, knowing what the expert looked for, set to work to supply it. The expert now seems to have lost some of his certainty; and one may expect that the American millionaire, seeking old masters, will demand, in future, guarantee certificates from the chemist and the radiographer. It is an indication of the steady march of science, but it will be a sad prospect for those who, like the venerable old gentleman known to a friend of Dr. Laurie's, retorted: "I don't restore old masters; I make 'em."

New Ideals in Air

Sir Frank Dicksee was moved, at the recent dinner of the London District of the Institute of Journalists, to reply to some of the criticisms on the Royal Academy of Arts, over which he presides. It cannot be said that these criticisms are very new—the old members of the community will discern a more or less familiar ring about them—but it is, perhaps, as well that the Academicians do not let them go by default. That the Royal Academy is behind the times, and out of touch with modern movements and ideals in art, has been a constant complaint with the leaders of new movements and with the critics who become protagonists of such movements. "Art," said Sir Frank, "was a flowing stream, not a dead pool, and although some new movements might, in the first instance, be almost shocking, they demanded every consideration as soon as there was reason to suppose them to be backed by sincerity of purpose and sufficient technical skill." We suspect that the Academy is less troubled in detecting the technical skill than in being assured of the sincerity of purpose; and, truth to tell, a closer touch with art circles in our earlier days gave us some ground for believing that to shock the masses was a very fruitful way of getting a lift out of the rut and one's name into the papers. In the nature of things, a body like the Academy must always be a little behind the most advanced movements for the good reason, as the Hon. John Collin advanced, that a movement must be a great deal more than "modern" to be worth exhibiting. Criticism of established institutions, like the Royal Academy, if sometimes annoying, has its uses, for it naturally puts the Academicians on their mettle. Indeed, a too complaisant acquiescence with academical traditions might lead to a stagnation that would prove even more damaging to art than some of the "revolutionary" movements at which the Academicians look askance.

CHURCH INTERIOR FROM A WATER-COLOUR BY JOHANNES BOSSBOOM.

ESSAYS BY THE WAY

II.—Plate Glass Windows

By "SCRUTATOR."

The admissibility of plate glass for windows has been a recurring topic of dispute amongst architects since it became popularised in the ultimate quarter of last century.

Even in those days there were Modernists who said, "This is a modern thing, let us use it in a modern fashion"! only the trouble was they didn't. It therefore became the perquisite of the practical man, the sort of fellow who believed in taking gates after the proverbial fashion of bulls, lest any dalliance with the theory of the opening of gates might perceptibly delay the progress of the world, and, horrible thought—he might, as the result of having used his intelligence, be accused of being an "Intellectual."

The history of the mis-use of plate-glass is writ large on the buildings of the period. It even has the dignity of belonging to tradition, though it be but the tradition of the bad to the worse. It is, in brief, the tale of the ever-increasing mastery of the glass-maker over his material, and his ability to make his sheets larger and larger. The small leaded pieces of Mediæval and Tudor days, set in their metal frames, gave place to the larger squares of the sash windows of Mary and William and Queen Anne, which had their beginnings in the windows of Inigo Jones.

In these windows the panes were relatively small and the bars comparatively thick when contrasted with the larger panes and the slenderness of the bars characteristic of the late 18th century.

As the pane grew larger the encircling woodwork became thinner, which would on the first consideration appear to be unreasonable, until on reflection one perceived that this same encircling woodwork might, as it became thinner, also become harder.

I believe it might also be contended that there was some decrease in the area of the window as it progressed from Carolean to Regency. This also would

seem reasonable, for if the panes be enlarged and the woodwork reduced, then a smaller lighting area is required.

Thus things developed more or less reasonably and logically, and without undue haste, until about the time of the great Exhibition, which, if my memory serves me right, was somewhere in the vicinity of the year 1851. This was a glassy time. All London went mad over the Crystal Palace, and the advent of the Crystal Palace was the advent of the sheet-glass window.

It was also a time of hurry and scurry—an unreflective, unphilosophical time; things had to be done then and at once, without undue procrastination or enquiry into the reason of things.

In effect, the typical twelve-paned window of the late Georgian and the Regency was hurriedly transformed into the four-paned window of the snifty 'fifties—that is, the upper and the lower sash were each translated into an "unresolved duality" by a vertical glazing bar. The sheet glass was, however, comparatively light, so the section of both frame and bar did not greatly differ from their predecessors. There was, however, a slight perceptible increase in weight and depth. About this time, too, there was introduced that "abomination of desolation," which all true lovers of sash windows must reprobate with curses and exorcise with saw and chisel—"Horns." Horns to the lower and horns to the upper sash, nasty little bits of wood that stuck out and help lazy joiners to make easy joins!

Then, the aristocratic sash window—the pampered pet of Stuart kings, the elegant friend of Regency Corinthians—was to undergo one last indignity, when the one remaining glazing bar, the last thin link with happier times, was to give place to that unmitigated horror, the sash window in two halves without any

sub-divisions, glazed with plate glass! For it had arrived at last, this "glory of the glaziers," and was received with the make-shift embrace of the ready-made.

There was, of course, a fashion of plate glass, as previously there had been for sheet, and those who had not discarded their earlier sashes of the small divisions during the sheet-glass period now made haste to rectify their error. Throughout the pleasanter residential parts of London and the suburbs, in country, town and village, delightful old Queen Anne and Georgian houses gaped like toothless Nonagenarians after painful extractions by the Victorians. Many of them, indeed, are to-day being fitted with a false set, which if they are not the "real article," sufficiently improve the appearance.

These plate-glass windows had, perforce, to have their wooden frames increased in order to render them strong enough, and for some reason the horns also grew a bit bigger, and there you had it, a nasty, lop-sided, ill-balanced, disproportionate contortion, difficult to manœuvre and excessively clumsy, the illegitimate offspring of a worn-out aristocrat mated to the most chic of moderns. Small wonder that in the architectural rejuvenation that was to follow the young architects were made to abjure plate-glass and all its works.

Thus there grew up a body of illuminati, divided and sub-divided into groups and sects, diverse as to many of their aims, yet united with this one hate—the hatred of plate glass. It was indeed fallen from grace, eschewed from fashion and ex-communicated by the high priests of building, it became the associate of the lesser commercial gentry, until it was the inseparable companion of the aspiring tradesman small and great. Possibly their mission was to keep the use alive; they became, as it were, the repositories of a great trust. In their small suburban shops, as well as in the larger town establishments, they created a market which gave the manufacturers a certain stability. They did, too, from their experience in these same shop fittings, gradually evolve through a series of adventurous essays into a more correct handling of the precious material.

Their first notable success was gained when they eschewed the circumambient wood framing; for plate glass is a material of so rich a quality and so costly a price that it is something of a luxury, like a valuable gem—or, perhaps, a better comparison would be a valuable picture, which demands a consistent and proper framing. It is also extremely heavy, and the intelligence resents both on practical as well as æsthetic grounds the miss-mating of the wood and glass. Even a use of the harder woods, such as oak and mahogany, does little to improve the conjunction—in fact they do but seem to stress the original error. So let it be definitely assumed for the future that plate glass demands for its proper support and furnishing some form of metal. This metal may frame and clip it, holding and emphasising the edges by the determination of its grip. The one thing such metal may not do under any circumstances is to imitate wood.

When the occasion and subject make it possible, such as, for instance, in certain screens, etc., the glass may be held finely in certain determined positions, such as at the hinges or at the supports, and this is in effect to display the naked edge of the glass, which must then be gently rounded. This is probably the method most fully illustrative of the quality and nature of plate glass, the one that best displays the intrinsic beauty of the material, and if the metal be a very modern product, such as rustless steel, then I find that the combination is ideal. Bronze is good, but not so good; it has rather too long a tradition to associate with so obviously a modern.

Ordinary steel is not bad, but there is a sharpness about it, a suggestion of rust that definitely writes it down as a poor relation; it depends too much on its protective coat of paint.

Wrought iron in conjunction with malleable is quite good when used as a screen in front of plate glass. This has the right note of history, and has in this relation been used both in Paris and in London for the doors to flats (of the type known as palatial!) and in similar situations.

Cast-iron is vile and almost worse than wood, its crystalline friability doesn't lend sufficient stiffness in support of another friable material; there is no ductility, it can bring no strength to the union, but is rather a source of weakness. It would almost be better to use it for ornamental ridging to roofs—and I can imagine nothing much worse than this!

One of the features of the recent Exhibition in Paris of Decorative Art was the use of all kinds of glass, and some of the smaller buildings contained perhaps a hint of how it might be possible to use plate glass in buildings of a domestic character. The problem is one full of charm for the adventurous.

Book Reviews

Worms in Furniture and Structural Timber. By John Girdwood. (Oxford University Press. London: Humphrey Milford). 1927. 12s. 6d. net.

This book has been written from the practical experience of the author in his quest for a reliable means of eradicating furniture pests. Contrary to general opinion, he has found that a mixture of turpentine and paraffin, which is harmless to the polish and colour of the wood, is quite strong enough to destroy "worm" in all stages of development, and that little success has hitherto attended this treatment because these materials were supplied too sparingly. The earlier chapters of the book describe the author's experiments upon different kinds of wood, photographs being given to show the difference between an ordinary treatment and "saturation." After detailing the procedure to be adopted, he then goes on to describe wax preparations for stopping up the worm holes and sealing the surface of the wood, so that the interior may be kept in a more or less toxic condition to make it immune from fresh invasions by the beetles which are primarily responsible for that condition known as "worm."

Classic Architecture. By Charles F. Mitchell and George A. Mitchell, F.R.I.B.A. (Batsford, London). Portfolio and Text, 10s. 6d.; plates, 8s.

A series of ten plates, in portfolio, illustrating typical examples of the Grecian and Roman orders, with full details and a selection of Greek and Roman ornament. Those directly concerned will find this book indispensable.

The foundation of the new Masonic headquarters in Great Queen Street, London, will be laid by the Duke of Connaught, the Grand Master, on July 14. The site has now been practically cleared of the old buildings. The architects for the new building, selected in competition, are Messrs. H. V. Ashley and Winton Newman.

Mr. J. D. Rockefeller, jun., who made a gift to the French Government of 18,000,000 francs (about £145,170) for the repair and upkeep of the Palaces of Versailles and Fontainebleau, and the restoration of Rheims Cathedral, has made a further gift of 40,000,000 francs (about £322,600), to be devoted to the same objects.

New Ways and Means

*The Editor will welcome early information of
New Plant, Materials and Fittings*

New Designs in Pipe Brackets

Three new designs in pipe brackets, made by Messrs. Walter Slingsby & Co., Ltd., of Woodhouse Road, Keighley, are illustrated. The topmost bracket shown is essentially an "expansion pipe" type, having been designed to meet the requirements for a pipe bracket which will allow hot water pipes to adjust their position when intermittently in service, and consequently expanding and contracting. These brackets can be built into the wall to give a secure fixing. The two lower brackets shown are designed for fixing at floor level, as ordinary pipe carriers. It will be noticed that the loop which carries the pipe is hinged to facilitate the fitting of the pipework after the brackets have been fixed in position. The bolt holes on the bracket itself are also arranged to give a steadier fixing than is usually provided, one bolt being secured to the wall and one to the floor.

The "Wask" Pipe Brackets.
(Walter Slingsby & Co., Ltd.)

New "Reversible" Casement Fastener.
(Young & Marten, Ltd.)

A Refinement in Casement Fasteners

The casement fastener of the "cockspur" type, shown in one of our illustrations, is of a new "reversible" pattern which has just been placed on the market by Messrs. Young & Marten, Ltd., of Caledonian Works, Stratford, E.14. This fastener can be easily and quickly altered from right to left hand, to suit the casement to which it is being fitted. The handle works on a hardened steel rivet, which is inserted from the back of the bracket without the use of any tools. The rivet head itself is countersunk, so that it fits flush with the woodwork of the casement, and when fixed in position it is thus secured against working loose or becoming detached.

Two New Novocrete Products

Some new flooring tiles and partition panels are included amongst recent additions to the range of products made by Messrs. Novocrete and

Cement Products Co., Ltd., of 246 Regent Street, London, W.1. The tiles in question are obtainable in a variety of soft tones, including white, with three distinct finishes: (a) natural state, with a non-slip surface, suitable for kitchens and passages; (b) natural state, but with the edges squared up for laying with a fine hair joint; and (c) with the surface scoured smooth and wax polished, to show up the aggregate. Several standard sizes, e.g., 6 in. x 6 in. x $\frac{3}{8}$ in. and 9 in. x 3 in. x $\frac{3}{8}$ in., are made, but since they are composed of 66 per cent. of wood, like other Novocrete products, they can be cut with an ordinary saw when necessary. Ordinarily they are laid on a concrete foundation, the surface of which has been grouted with Portland cement and bedded, to a thickness of $\frac{1}{4}$ to $\frac{3}{8}$ in., with a mixture of 2½ parts of clean sand to 1 part of cement. Special precautions should be taken to prevent any of the cement setting upon the surface of the tiles, and it is also advisable to retard the drying out of the surface by keeping wet sacking on the work for three or four days. The partition panels are supplied in a standard size measuring 8 ft. 6 in. x 3 ft. x 1½ in., with a finished surface on both sides. A similar slab with a finished surface on one side only can be supplied for use as a wall lining for timber or half brick walls, or to meet cases where

New Adjustable Chain Cramp.
(Thos. R. Ellin (Footprint Works), Ltd.)

walls are not found to be sufficiently soundproof.

A New Cramping Device for Builders

An adjustable cramping device, designed to fit irregular objects, in addition to carrying out ordinary straightforward cramping duties, has just been placed on the market by Messrs. Thos. R. Ellin (Footprint Works), Ltd., of 31-47 Hollis Croft, Sheffield. This cramp, which is illustrated in the act of supporting pipe-work to an overhead beam, consists of a length of chain and a screwed head provided with a spindle to give the necessary tightening effect. One end of the chain is permanently attached to the tightening gear, but the effective length of the chain can be adjusted by slipping the nearest link over the hook which is to be seen in our sketch. The end of the screwed spindle bears upon the object which

New Mortice Lock.
(Samuel Parkes & Co., Ltd.)

is being cramped, and when tightened up is claimed to give a perfect cramping action, in that a double pull, equal at both sides, is provided by the chain so that all strain is evenly distributed. At present these cramps are being made in three sizes, with 5, 7 and 12 feet of chain respectively.

An Improvement in Locks

A mortice lock of tubular shape, which can be fitted by merely drilling a 1-in. circular hole from the edge of the door into the stile, has been introduced by Messrs. Samuel Parkes & Co., Ltd., of Pretoria Works, Willenhall, whose London office is at 329 High Holborn, W.C.1. This lock is also provided with a double-handed action, which automatically adjusts itself for both right or left hand doors without having to remove the fore end of the lock casing. The mechanism of this lock is also of an improved and simplified pattern, but one of its outstanding features seems to be the ease with which it can be adapted to doors with narrow styles.

THE FIRST GRAND STAND AT EPSOM.

THE EPSOM GRAND STAND

Few buildings of modern times have been erected under circumstances of such haste and with such expedition as the Epsom Grand Stand. The structure was ready for use at the appointed date, which was May 31, but only just ready. Right up to the last moment plasterers, painters and carpenters were still busily engaged in completing the vast fabric, which proved capable of accommodating 20,000 spectators of the Derby. Five hundred men have been employed on the construction of the stand day and night. Many difficulties have dogged the work after it was begun, owing to the industrial troubles of last year, but co-operation and goodwill enabled it to be completed in time. The architects, Messrs. Reeve & Reeve, of Margate, in association with Messrs. Elcock & Sutcliffe, of Avenue House, Northumberland Avenue, W.C., are to be congratulated upon accomplishing a task of such difficulty.

What of the design of the structure? Seen from the Downs the stand presents a bright appearance. The white concrete tiers, the blue girders, and the dull red roof and brickwork provide a pleasant combination of colours, while the general effect of the somewhat hard lines of the composition is softened by distance. A closer view, such as is obtained from Tattersall's, shows an absence of decoration, and the great girders become more prominent. The truth of the matter is that the architects have accomplished wonders under the circumstances imposed upon them, which circumstances appear to have included in the first place the necessity of the severest economy. This is, of course, a natural condition which afflicts nearly all building schemes at the present moment, yet it is noticeable that a certain number of building areas manage to escape from it, and are even able to display a certain architectural ostentation and opulence. It must, however, be admitted that a race-course stand, destined to be occupied for a rather limited number of days during the year, cannot be and ought not to be as lavishly decorated as a picture theatre; yet it may be supposed that the erection of

a stand capable of holding 20,000 people, a fair proportion of whom are paying high prices for their seats, is not altogether an unprofitable undertaking. The promoters of the scheme were, of course, aware that, provided the stand was stable, it would be filled, whatever its architectural merits or demerits might be, so popular is the Derby as a national institution. Yet it may be suggested that they were under a certain obligation to the public to erect a structure which should not represent the bare and absolute minimum of cost, a utilitarian framework so entirely without adornment, and without such variety of form as may be attained by the subtleties of architectural composition.

It is often said that good proportion and other principal qualities of fine building cost nothing, and to a certain extent this is true. Very often thoroughly bad designs are just as expensive to execute as very beautiful ones. And yet this dogma of the possible association of extreme cheapness with good design is generally fallacious. While it is true, of course, that a composition expressing refinement is no more costly than another equally elaborate which is misconceived, it is almost impossible that a structure representing the very acme of cheapness, and designed to achieve nothing but economy combined with utilitarian efficiency, can have the highest qualities of architecture. *Something* extra must be paid if the architectural ideal is to be achieved. One is not making an extravagant demand in stating this, for the vast majority of building owners willingly concede as much. If the proprietors of the Epsom Grand Stand have been loath to supply this extra, their architects have at least provided them with a structure extremely well planned and serviceable from every point of view. Gone for ever are the days when a stand could be just a stand, and nothing more. In modern times every building, even if its function appears to be of the simplest, has numerous small apartments which tend to destroy the unity and simplicity of the architectural "programme," and make it ever more

difficult to combine the various parts of the structure into an organic whole, harmoniously conceived. Thus it was at Epsom. Besides the long tiers of seats, which may be arranged in a broad and stately pattern, there had to be provided restaurants, drinking bars, special rooms for members, stewards and jockeys, extensive lavatory accommodation, and last, but not least, a suite of royal apartments. In these circumstances, therefore, it is not surprising that the back of the building represents a somewhat disorderly array of windows of different sizes. A certain measure of symmetry has indeed been achieved in the central portion; but the two wings are not homogeneous either with each other or with the part between them. Three very prominent long slits of staircase windows out of scale with the rest of the fenestration are in evidence, the centre one of which cuts the composition in two. Just for the sake of comparison, and without wishing to push the analogy between a modern and an ancient building too far, let us turn our thoughts for a moment to the Coliseum. Here we have a building far larger, of course, than the Epsom Grand Stand, but it so happens that it has a certain resemblance to the latter in that the subsidiary requirements of the building were very complex. The space underneath the tiers of seats was occupied by a vast number of chambers to accommodate slaves and gladiators and the lions and other animals used in the great display. We may be sure, also, that places for food and drink were also provided within the structure. Yet if we look at the outside, at the back elevations, what do we find? A composition of a noble simplicity and grandeur which even in its ruin is still the admiration of the world. But, we may depend upon it, this simplicity and grandeur cost money. It is a legitimate complaint against the back of the Epsom Grand Stand that, although prominently exposed to public view, it has no dignity. The windows are all at sixes and sevens, and the façade has no punctuating members, it seems to be cut off at random at both its lateral extremities, it has no recognisable base and no crowning feature capable of dominating the whole. And this indeterminate quality is also present in the front elevation, of which the long horizontal lines appear to end abruptly without consciousness of the fact that they are coming to a conclusion at any particular point. Of course, if we are to assume that the wings are meant to be extended in the future, their present unfinished appearance would be justifiable. The central portion, however, which is taller than the rest, is not so constructed that it could be enlarged and encroach upon the wings, and yet it also ends abruptly and has nothing to give formal emphasis to its lateral extremities. It may be of interest to conjecture in what manner such formal emphasis might have been attained. The cheapest way of accomplishing this end would be, of course, to concentrate attention upon the roof, and to make this a self-contained entity by tilting up the eave lines at their extremities. Such a treatment, although it is traditionally associated with the architecture of wood, perfected by the Chinese and Japanese, is not in itself inappropriate to ferro-concrete, a material which shares the qualities of wood inasmuch as it is capable of bearing a high transverse and tensional strain. And there can be little doubt that in modern architecture there is a tendency to make experiments in this direction. Accepting, however, the architects' decision to keep the roof quite horizontal, the only other method of enclosing in the composition would be to give a little additional solidity to the façade at its corners. In the case of the left-hand side this has been done by making the interval between the

uprights smaller at this point, but on the right of the central portion this expressive differentiation is absent, and the series of equal intervals suddenly stops without preparing us for this cessation.

It is obviously a stand, so constructed that a large number of people are enabled under cover to observe a spectacle in front of them, and as such it has the merit of being a direct and straightforward composition. Moreover, the increased height of the central portion provides an imposing dominant to the building, so that it has unity of an elementary kind. The contrast of the vertical supports at the base of the centre stand, and the long horizontal lines above, is a striking one. Whether these latter could have been articulated in some way so as to take cognisance of the prominent vertical lines of the substructure is an interesting problem of design. One important formal merit this central part possesses, namely, the topmost interval between the roof and parapet immediately below it is taller than the similar intervals between the other stages, and this has the pleasant effect of closing the series and of helping to form a terminal emphasis at the upper extremity of the composition. It must be confessed, however, that the top of the west stand roof is lacking in substantiality, and the thin flat roof seems of insufficient importance to form the crowning feature of the structure. Turning from the general composition to the actual parts of the building, its constructional members, we find that these are exposed in their nakedness, no attempt being made to disguise their surface quality or to give them the attributes of architecture. Here, again, it may be presumed that considerations of economy prevented any elaboration of treatment being attempted. It must, however, be borne in mind that in addition to the need for money, speed was also a dominating factor. About 20,000 people will be accommodated instead of the 6,600 which was the maximum the old stand would hold. The structure is about 700 ft. long and high, comprising a west stand of 150 ft. in lengths and 60 ft. high, a centre stand of 330 ft. and 70 ft. high, and the east stand of 210 ft. and 40 ft. high. There are also 215 private boxes provided, and it is noteworthy that for each stand separate bar, luncheon room and lavatory accommodation is provided. The whole of the original stand fronting the racecourse has been pulled down. Of the old stand, only the more recently erected dining-rooms at the back remain, and the new stands, extending both east and west, are built over the space once occupied by Lengland's No. 1 and Barnard's No. 1 stands. The new stand is partly parallel with the course, but at its west end—that nearer the Paddock—is set at an angle to it, thus giving everyone a good view of the straight and winning post. Special attention has been paid throughout to the ensuring an unobstructed angle of vision for everyone, and the elimination of the usual large number of supporting stanchions. The main girders spanning the front are 60 ft. in length.

It is of interest to compare this great structure with a little prototype of the 18th century here illustrated, in which the tiers of seats are placed on the roof of a building of the traditional kind, which, however, is provided with open balconies. The contrast between these two buildings does much to indicate how far we of the twentieth century have travelled since those days.

The consulting engineer was Mr. Harold Cave, 9 Victoria Street, S.W.1. The contractors were Messrs. Howard & Co., Broad Court, Bow Street, Covent Garden, W.C.2. The steelwork contractors were Messrs. Heenan & Froude, Ltd., Blackfriars House, New Bridge Street, E.C.4.

BRITISH ARCHITECTS' CONFERENCE

London, June 20-25, 1927

June 20.—A reception will take place at the R.I.B.A. Galleries from 9 p.m.—11 p.m. Members will be welcomed by the President and Mrs. Dawber. (Morning or evening dress optional; smoking; light refreshments.)

June 21.—10.15 for 10.30: The Conference will assemble for the Inaugural Meeting. 1 p.m.: Luncheon interval. 2 p.m.—6 p.m.: Alternative visits: Visit A—A char-à-banc drive to The Stationers' Hall, The College of Herald's, The Mercers' Hall, The Brewers' Hall, and The Mansion House (inclusive cost, 4s. 6d. each). Visit B—A char-à-banc drive to The Fishmongers' Hall, The Customs House, The Goldsmiths' Hall, The Mansion House (inclusive cost, 4s. 6d. each). Visit C—A char-à-banc drive to Trinity House, The Tower of London, and The Port of London (inclusive cost, 6s. each). Visit D—The British Museum and The Foundling Hospital. A char-à-banc drive to The British Museum and The Foundling Hospital (passing through the garden of Russell Square). Tea at Holborn Restaurant (inclusive cost, 5s. 6d. each). Visit E—A visit to the Inns of Court. A walk through the following buildings: The Inner Temple, The Middle Temple, The Temple Church, The Law Courts, Lincoln's Inn, Gray's Inn. Tea at the Holborn Restaurant (inclusive cost, 5s. 6d. each). 6 p.m.—8.30: Dinner interval. 8.30—11 p.m.: Alternative receptions. F—Reception by the Architectural Association (34 Bedford Square, W.C.1) with entertainment and inspection of the work of the A.A. school. G—Reception by the University of London School of Architecture in the Bartlett School Buildings (Gower Street, W.C.1), with entertainment and an inspection of the work of the school.

June 22.—10.30 a.m.—1 p.m.: Alternative visits. H—New London Buildings, a char-à-banc drive to Devonshire House, Bush House, and Adelaide House (cost of drive, 4s. 6d. each). I—New London Stores, a char-à-banc drive to Selfridge's, Liberty's, and Peter Robinson's (cost of drive, 4s. 6d. each). K—A drive round Central London; motor char-à-banc drive to Waterloo Bridge, Somerset House, City Churches, Whitehall, Pall Mall, St. James's Street, Piccadilly, Regent Street, Regent's Park, Aldwych, and Kingsway (cost of drive, 4s. 6d. each). L—Visit to Kensington; motor char-à-banc drive with visits to Kensington Palace, the Museums and Government Buildings in South Kensington, the Albert Hall and Memorial (cost of drive, 4s. 6d. each). 1 p.m.—2 p.m.: Luncheon interval. 2 p.m.—7 p.m.: M—Garden party at Hampton Court. There will be no limit to the numbers, and all members are especially urged to be present, as the Conference photograph will be taken on this occasion. The party will travel to Hampton Court by motor char-à-banc from the West End, via Richmond Park and Kingston, and will return via Ham Common (inclusive cost, 10s. each). 7 p.m.—8.30 p.m.: Dinner interval. N—Exhibition, 8.30—10.30 p.m. There will be an exhibition in the Main Library and the Galleries of the principal treasures of the R.I.B.A. Library, including drawings, rare books, sketch books, etc. Smoking and light refreshments.

June 23.—10 a.m. to 6 p.m.: Alternative excursions. O—Knole Park, Penhurst, and Hever Castle. A char-à-banc drive to Wrotham, Ightham, Sevenoaks (lunch), Knole Park, Penshurst, Hever Castle, Edenbridge, Westerham (tea); (inclusive cost, 16s. each). P—Hatfield, Welwyn, and St. Albans. A char-à-banc drive to St. Albans Cathedral, St. Albans (lunch), Hatfield and Welwyn Garden City

(tea); (inclusive cost, 16s. each). Q—Greenwich and Blackheath, etc. A tour by steamer to Greenwich (lunch), visit to Greenwich Hospital and Observatory, motor char-à-banc drive to Blackheath, Morden College, Dulwich Village (tea), and back by road (inclusive cost, 16s. each). R—Windsor and Eton, etc.: A tour by motor char-à-banc to Eton, Windsor (lunch), Windsor Castle, and return via Bedford Park (inclusive cost, 16s. each). S—9 p.m. to 2 a.m.: Ball in the R.I.B.A. Galleries. A scheme of decoration will be arranged by the Architectural Association (charge for single tickets, 7s. 6d.; double tickets, 12s.).

June 24.—10 a.m. to 6 p.m.: Alternative excursions. T—A visit to Oxford; by train from Paddington to Oxford, drive round University and College buildings, lunch at the Mitre Hotel, and return by train (inclusive cost, 22s. each). U—A tour of the North Downs; by train to Guildford, and drive by Farnham, Odiham, Hindhead (lunch), Haslemere, Chiddingfold, Leith Hill, Dorking (tea), Shalford, and back by train from Guildford (inclusive cost, 18s. each). V—7.30 p.m.: Conference Banquet. The Conference Banquet will take place in the Grand Hall, Hotel Cecil, Strand, W.C. The Royal Gold Medal for Architecture will be presented to Sir Herbert Baker, A.R.A. (tickets 15s. each, exclusive of wines and cigars).

June 25.—10 a.m. to 7 p.m.: Alternative excursions. W—A visit to Cambridge; by train from Liverpool Street, drive round University and College buildings, lunch and tea at the Bull Hotel, and return by train to Liverpool Street (inclusive cost, 25s. each). X—A visit to Canterbury; by train from Charing Cross to Canterbury, visit to the Cathedral, lunch and tea at the Falstaff Inn, and return by train to Charing Cross (inclusive cost, 15s. each). 10 a.m. to 1 p.m.: Alternative visits. Y—The London Museum. Z—The Tate Gallery.

In view of the great success of the last five Conferences in the provinces it is expected that there will be a record gathering this year, and it is important that notification should be made to the secretary of the R.I.B.A. as soon as possible by those intending to be present.

Coming Events

Town Planning Institute.—On June 10, at 5.30 p.m., in the Caxton Hall, Caxton Street, Westminster. The Thirteenth Annual Meeting.

The Institution of Municipal and County Engineers.—On June 15, 16, 17, 18 at Torquay. General Meeting and Conference.

The Chelsea Society.—June 9-18.—In the Council Chamber of Chelsea Town Hall. An Exhibition of Pictures of Chelsea Past and Present.

Royal Institute of British Architects.—On June 20. Election of Council and Standing Committee. Election of Members.

Royal Institute of British Architects.—June 20—25. British Architects' Conference, London.

Cement Marketing Company, Limited.—On Tuesday, June 28. Visit of members of Institution of County Engineers to the Kent Cement Works, Greenhithe.

DEVONSHIRE HOUSE, PICCADILLY, LONDON.
CARRERE & HASTINGS, in association with PROF. C. H. REILLY, Architects.

DEVONSHIRE HOUSE, LONDON

A paper, written by Mr. Thomas Hastings, of Messrs. Carrere and Hastings, New York, who, in collaboration with Professor C. H. Reilly, were the architects of the new Devonshire House, Piccadilly, was read on his behalf at a meeting of the R.I.B.A. on Monday. We give the following extracts from it.

There has been a most interesting development of the apartment building in New York City, beginning with the lowly tenement house, which was intended primarily as the home of the poorer citizens of the community.

As the multiple storey residence became more popular, improvements continued in the arrangement and equipment of the buildings, and this condition was hastened by the adoption of a very rigid and specific law in 1901, the provisions of which still apply to all buildings occupied as the home of three or more families living independently of each other and doing their cooking upon the premises.

In the evolution of buildings of this general type we have the tenement house and the apartment house, differing in degree only as to location and quality; also the apartment hotel, a combination of the hotel and apartment house functions, with the limitation against independent cooking in the apartments of the several tenants.

In general, in the apartment hotels the cooking in the apartments is avoided by a central kitchen, operated by the hotel management, with service to the several apartments by means of lifts.

In many of these buildings each apartment is provided with a small serving pantry, through which the lift from the central kitchen passes, while in other cases the service from the central kitchen connects with a serving pantry on each floor, from which the individual apartments are served by the hotel employees.

From its humble beginning as a simple tenement house, sometimes housing only six or eight families, the apartment building and the apartment hotel have grown into structures covering an entire block front, and involving many millions of dollars of investment in land and building.

The large amount of money required to carry forward such a project to completion, and to the point of producing revenue, makes it important that the construction work should proceed with the utmost speed, and that every effort should be made to eliminate avoidable delays.

From the inception of the project these rules apply both to architect and builder, and in each case it has been necessary to develop methods of securing results which have gone hand in hand with the evolution of the building of large area and great height.

The schedules of progress, subdividing the work into its constituent parts, are prepared with great care, and prove most helpful in co-ordinating the preparation of materials for the several branches of the work and in determining in advance the rate at which the work must proceed to insure completion by a specified date.

Expeditors in the field and shop carefully check the progress of the preparation of the materials for the structure, and see to it that shipments are made so that the materials may reach the work as required and in proper sequence.

Successful results cannot be obtained if the architect does not supply the contractor with all needed

information in time to meet the scheduled requirements, and the architect must see to it that all contractors employed on the work are co-operating and maintaining the scheduled progress.

These conditions have led to the adoption of methods of construction which ensure rapidity of completion and the development of skilled engineers who are trained in the scheduling of operations and the following through and co-ordinating of the work in the shop and at the site. All of this is of the utmost importance to the investor who wishes to determine the extent of his investment and the period during which he must carry the burden of expense before returns may be expected.

When the good old Kent House, so long the property of the Dukes of Devonshire, was sold to the distinguished firm of Messrs. Holland & Hannen & Cubitts, it was realised that, due to the changing character of its environment, the old house must give way to the encroaching commercial demands. Having determined to build a high-class apartment house on the principal portion of the site, they determined to consult architectural authority with a view to obtaining advice as to how to secure plans for a building which might in some measure be worthy of such a beautiful site, and at the same time solve their problem in the way of a practical investment.

Messrs. Holland & Hannen & Cubitts selected Professor Reilly as their adviser, and it was because of the fact that Professor Reilly was unusually familiar with American architectural practice and the development of the apartment house problem in America, that he first advised the selection of an American architect, and my delight was unbounded when I received a cable from Messrs. Holland & Hannen & Cubitts asking if I would be interested. The thought of building something in the country of my early forefathers appealed to my imagination and stimulated my enthusiasm.

Professor Reilly, together with Mr. Stevenson, the director of the company, and Mr. Hannen, a junior member of the firm, arrived in my office not two weeks later, and we immediately began work with the understanding that Professor Reilly would collaborate with me to the fullest extent and on an equal footing in designing and assisting in the execution of the work.

To have client and builder in one was a somewhat new sensation, and a most happy one. The intelligent and helpful interest they took in our part of the work will never be forgotten. Their willingness to spend money where no direct interest returns were visible, for the sake of art and with a just pride in the traditions of the well-known site, was most remarkable, and we never could have accomplished whatever there is of interest in the building excepting through such friendly understanding and collaboration.

The programme is, in a sense, a new one for London, and therefore the outcome or results must of necessity be somewhat foreign, and this fact made us all the more anxious to produce harmony with our neighbours. We all agreed that we would build as much as possible in a style which would seem to be modern and, at the same time, related to the traditions of our immediate ancestors. We naturally drifted into what, perhaps, might be called the period of the English revival of Italian classicism in the early nineteenth century. As a matter of composition, which, of course, if properly undertaken, will of necessity make its impress upon the style and character of the design, we agreed that we should first of all make the façades express what they clothed.

There is no dominating principal feature in such a building to express itself in façade and add colour to the results. We must obtain colour and interest with all the openings the same size and storeys the

same height, excepting the ground floor, which was to be reserved for housing banks or other institutions.

The first thing we did was to make certain well-defined restrictions for ourselves, so as to come within reason and at the same time adhere to the practical point of view. We fixed the floor lines equal in height, and the window sills and lintels at equal distances from the floors of each storey.

This, we felt, was a vital part of our programme and any colour obtained with the distribution of our openings would of necessity be obtained within these limitations. In accordance with the natural law, if this were adhered to our design would of necessity express the purpose for which it was made.

We furthermore avoided the superfluous use of pilasters or pediments and other architectural motives which would destroy the uniformity and simplicity we believe should express the problem to be solved. In a general way, we soon determined upon a recessed central front, so as to give extra corner rooms for light and air in the apartments. The widening of Berkeley Street was very wisely determined upon by our clients, and we all agreed that the main entrance to the apartments should be placed on a new street—we were to determine upon connecting Berkeley with Stratton Street; this would give the maximum frontage for rental on the three remaining streets.

I cannot close without a word of appreciation of the site—the great depth of circulation necessary on the first floor because of the necessity of placing the elevators so as to arrive advantageously for the best apartments on the Piccadilly front.

I cannot close without a word in appreciation of our gratitude to Mr. Jackson for the admirable and conscientious way he interpreted our drawings in the hallways, somewhat Pompeian in design, and the dining-room, which we designed in the Adams character. I deeply appreciate the opportunity afforded me by Messrs. Holland & Hannen & Cubitts to participate in this most interesting work, and cherish with increased pleasure the gold medal so generously bestowed upon me by the Royal Institute of British Architects, which proved to be the open sesame for me with Professor Reilly, my most efficient collaborator in our architectural contribution to the new Devonshire House.

Correspondence

To the Editor of THE ARCHITECT & BUILDING NEWS.

SIR,—As Solicitor to the Incorporated Association of Architects and Surveyors, my attention has been called to the report appearing in your issue of the 27th inst. (page 906, column 1, paragraph 6) of the evidence given before the Select Committee of the House of Commons on the Architects (Registration) Bill.

Major Barnes, F.R.I.B.A., is reported to have stated that the *Incorporated Association of Architects* was an off-shoot of the *Faculty of Architects*, and while I appreciate that you were not responsible for the statements made, which I presume are reported correctly, I must ask you to be good enough to give publicity to the following facts.

The Incorporated Association of Architects and Surveyors was incorporated on September 12, 1925. The Faculty of Architects was registered as a company on May 21, 1926, eight months later, and, finally, I have to point out that there has never been any connection between the two organisations referred to.

Yours faithfully,

D. H. BRAMALL.

THE AMERICAN BUSINESS MAN'S HOTEL—I

(This is the first of a series of three articles, by Mr. HOWARD ROBERTSON, dealing with modern American practice in the design of that type of hotel which is very largely patronised by the travelling business community. Many of the photographs and plans are reproduced by courtesy of Mr. E. M. Statler, who has been responsible for the creation of the Pennsylvania Hotel in New York and a chain of highly efficient and important hotels in other large American cities).

The successful design of a modern hotel, in whatever country it is built, can never be the work of the architect unaided. The situation is well summed up by Mr. E. M. Statler, who has probably carried hotel organisation for efficiency further than any single individual either in America or Europe, and who has described as follows the collaborations of talent necessary in hotel building: "The services required in establishing the proper preliminary analysis, as well as in developing the finished structure, include not only the skill and art of the architect, but the detailed technical advice of engineers and, above all, the supervision of a practical hotel man equipped with a thorough knowledge of the many important and incidental problems which develop in each department. The architects can help the hotel man—the hotel man

can help the architect—but alone they both tread on dangerous ground."

It is necessary to realise this fact in judging hotel design in the United States and in comparing it with European practice. The architect can do his best to solve a particular problem which is placed before him, but he does not create the conditions of the problem. He has got to bear in mind that there are many categories of hotels, each catering for its own special clientèle, and he must not imagine that, because one type of hotel is successful in serving some particular section of the public in some particular location, it will be equally suitable for a totally different class of business.

The conditions of life in America have their own particular characteristics, and the vastness of the

continent and of its opportunities is reflected in the tremendous scale of the hotels which are put up in all large cities to cater for the travelling public, and especially the business man. The smaller residential hotel in America has many points of similarity with European models, but hitherto there has not been on this side of the Atlantic any hotel development comparable to that which is producing vast caravanserais of 2,000 to 3,000 rooms, representing veritable cities in miniature.

Wages are high in America, and domestic labour is expensive. In consequence, the communal service which a hotel provides becomes an attractive solution to the domestic problem, and the apartment hotel has become extremely popular.

At the same time there is a vast travelling population which congregates in big centres which are separated by many hours' journey. The chief pursuit of this travelling public is business, and the business man who travels far demands the best of service in the way of hotel accommodation, and is able and prepared to pay for it. Conditions of working life in the States are arduous, but pay is good. Comfort therefore becomes a requisite, and the chief agency for its provision—money—is available, even amongst the class which, in this country, would be called the class of moderate means. There is nothing to prevent, in Europe, a standard of hotel accommodation equal to that in the United States except the question of the demand and the ability of the travelling public to pay the cost. Hotel design on a large scale repeats the problem of the perfect dwelling, replete with hardwood floors and every convenience of equipment; in the one, as in the other, there would be no difficulty in supplying all requirements, provided it were an economic proposition.

The nearest parallel in England to hotels of the type which the Statler organisation has produced in America are the large commercial hotels in our big industrial centres. In America practically every important town, with the exception of Washington, is an industrial town to a greater or less degree, and the

conditions to be met in creating a hotel service are fairly uniform. In every case the majority of guests are business men, the permanent or seasonal residents are few in number, and in that respect conditions are much the same there as here. But whereas in this country there is often provided in a large transients' hotel a certain amount of space for commercial purposes, such as sample rooms, etc., in America this feature of hotel service has been enormously developed, and hotel planning has been greatly influenced in consequence.

A growing feature of American commercial life is the numerous trade conventions and club or "fraternity" gatherings which at certain times of the year will take place in the various big centres, and which will suddenly tax hotel accommodation in many ways besides that of merely providing rooms in which to sleep. Sales conferences "get-together" meetings, banquets, and gatherings of men in some particular industry from all parts of the States will descend upon some town and require vast rooms, for banquets in which as many as 5,000 meals are served, and an immense amount of lobby and lounge space in which these "peak" numbers can be distributed without entirely dislocating the ordinary life of the hotel.

The economic factor of catering for these conventions is a very important one, for in some of the hotels the margin between profit and loss is largely dependent on the letting of space for "convention weeks." In one large Chicago hotel as much as £2,000 has been earned in the few days of a big convention, and these profits are on a much more attractive scale than anything to be derived from the hotel bedrooms. It is only fair to say, however, that experience is not the same in every city, and that in the case of one very large New York hotel it is stated that business from conventions shows very little profit, one reason being that these big meetings result in a great deal of damage to furniture and decorations.

The Statler system of hotels is represented in St. Louis, Buffalo, Boston, Cleveland and Detroit, but the largest building is that of the Hotel Pennsylvania in

Fig. 4.—PENNSYLVANIA HOTEL, NEW YORK: A FOYER ON THE BALLROOM FLOOR.
MESSRS. McKIM, MEAD & WHITE, Architects.

New York. Although not the most recent in design, it still remains the most interesting from the planning standpoint, for it contains practically every item of equipment and every facility for hotel service which has been incorporated in modern hotel design.

The Pennsylvania Hotel was completed in 1919, the architects being McKim, Mead & White. Up till recently it was the largest hotel in the United States, or, indeed, in the world; but it is now being surpassed in size by the Palmer House in Chicago, which has 3,000 rooms, whereas the Pennsylvania has 2,200, each of which has a bathroom containing either a full-size tub, or, in the case of the cheaper rooms, a shower bath.

Ever since its opening the hotel has accommodated an average of 2,600 guests, and its six restaurants serve an average of over 10,000 meals per day—a colossal figure. The problem of planning and organising for such numbers can be imagined.

The fact that a hotel of this type in America is used as a meeting-place by a vast number of people who are not actually occupying rooms accounts for the enormous development of its public space, for, contrary to general European practice, the hotel lobby is a rendezvous to which any respectable person is admitted without question, whether visitor or not; and as a consequence at most times of the day the ground-floor rooms are far more public and frequented than is the practice here, and hotel guests who wish for a certain privacy are accustomed to use the library and writing-rooms, which are very often found in the first floor or mezzanine.

The site occupied is about 390 ft. by 210 ft., and there are 18 guests floors, with an additional partial three floors which house various services. Below the street there are three full basements.

A glance at the ground floor plan (Fig. 2) will show the very simple main division of a block on the central axis, with two equal blocks on either side. In order, however, to understand the system on which the plan is framed, it is necessary to turn to the

second guest-floor plan (Fig. 3), where it will be seen that the service block at the rear is terraced over, while the rest of the plan is carried up on the principle of three re-entrant courts separating wings which are connected to a continuous "back-bone." It is the system of the tooth-comb, which is a favourite solution in America for deep sites, as it avoids internal areas, an analogy in London being the recently completed Park Lane Hotel, planned on a similar principle.

Apart from the extent of the public rooms, which occupy the bulk of the ground-floor space, the most noticeable feature is the provision of shops which are readily accessible from the hotel. Nearly every American hotel of this type makes provision for shops as well as the usual news stand, confectionery and cigar counters, etc. The aim of the hotel management is to arrange, as far as is consistent with good economics, that there should exist, in the premises, every sort of service which the traveller may need. In the Pennsylvania Hotel there is a bank, a broker's office, a travel bureau, a theatre bureau, in addition to such conveniences as Turkish baths, barber's shop, stenographic bureau, a haberdashery and chemist's shop, a women's "beauty parlour," and offices for telegrams, cables, stenographic work, etc. It is possible, in fact, without leaving the hotel, to enjoy in miniature, on the premises, the facilities which might be called upon in a day's business in the West End of London. This provision is a great convenience to the traveller, which must be experienced to be appreciated.

As regards the question of revenue to the hotel, some of these facilities are hotel services, such as, for example, the steamship bureau in the Pennsylvania, while others are let off to concessionaires. Each of these separate departments or services is revenue producing, and each department belonging to the hotel has a manager, and a budget which is checked from time to time by an auditor who, in addition to having charge of all hotel bills, finances the departments. The question of bad debts, etc., is looked after by a

separate credit department, and as great losses are possible, every possible check is instituted. An instance of this is the careful watch kept over traffic in and out of the hotel. Every traveller who goes up to or down from the bedroom floors with a bag or suit-case is scrutinised, and if the luggage of a hotel guest is unduly light, or there is any ground for suspicion, a report is at once made to the credit department, which takes any precautionary measures necessary.

The reception office, which is to the right of the main lobby, is an affair of many windows at which guests "check in" and out, where mail is called for, and accounts settled. Adjoining is the credit department, where letters of credit, travellers' cheques, etc., can be dealt with. All particulars of the guest are taken down in typescript by the "checker-in" when the guest arrives, and a copy goes to the bureau on each floor which takes charge of keys, letters, telephone messages, etc.; there is also an excellent system of book-keeping, by which every account is kept up to date, including all items such as telephone calls, laundry bills and so forth, all of which are signalled through at once by the department concerned to the main office. The American business man expects to be able to go to the hotel office and ask for his bill a few minutes before catching his train and find it ready for him. In the Statler hotels he is not disappointed, for the book-keeping is a very highly developed service.

Adjoining the office is a telephone room, where are found some twenty telephones on which calls can be made direct by enquirers to guests of the hotel. Provided that the room number is known, anyone can call direct up to any room, and this saves delay and the staff which would be necessary to put through all these calls. These telephones are in constant use throughout the day.

At the entrance to the lobby stands the porter's bureau, where the guest makes known his requirements regarding luggage, transportation, etc., while close to the checking-in office is stationed a small army of "bell-hops," under the command of "captain," who details boys to run messages, take guests' hand luggage up to rooms, etc. By this arrangement there is no delay on arrival at the hotel; the checking-in is quickly done, and the traveller is relieved of his luggage and taken up to his room in the elevator in very rapid time. This service is impersonal, but it is efficient.

(The next article will treat in detail of hotel services.)

Building News in Parliament

WESTMINSTER, Wednesday, June 1.

CIVIL SERVANTS AND ARCHITECTURAL COMMISSIONS.

A question with reference to the position of architects in Government departments in relation to private commissions excited considerable comment in the House of Commons. Mr. Morrison asked the First Commissioner of Works whether any of the chief architects in that department accepted commissions in their professional capacity from individual persons or private firms, and if so, whether he would take steps to prevent them doing so in future.

The reply given by Captain Hocking, speaking for the department, was that the chief architects in the Office of Works do accept such commissions in their private capacity, and that the First Commissioner is not prepared to prohibit them, as the interests of the department are sufficiently safeguarded by the conditions that (1) the work must not be undertaken during official hours; (2) name-plates must not be fixed on outside offices or private residences; (3) the use of official premises in connection with private

business is not allowed on any conditions, even after official hours; and there must be a clear understanding that the private work must not interfere with departmental duties.

The subject was then taken up by Sir Austen Hopkinson, who wished to know whether an architect carrying out a contract of £1,000,000 or £2,000,000 can devote his proper attention to his duties as a Civil Servant, and whether "the Chemical Trust" is to have the use of any Civil Servant it wants? To those questions Captain Hocking replied that, if the First Commissioner believed that the gentleman in question could not perform his duties to the Government, he would not be allowed to accept such commissions. "We really have no right," he added, "to interfere with the private time of an individual."

Competitions Open

Closing Date, June 15.

Layout and architectural treatment of approaches to the Palais de Justice, Brussels. Particulars, M. Le Conservateur du Palais de Justice, Brussels.

Closing Date, June 15.

Shakespeare Memorial Theatre Preliminary Competition. Full review of the competition published in our issue of January 28, 1927. Assessors, Messrs. Robert Atkinson, F.R.I.B.A., E. Guy Dawber, F.R.I.B.A., and Cass Gilbert. Particulars, Secretary, Shakespeare Memorial Theatre, Stratford-upon-Avon. Deposit £1 ls.

Closing Date, June 30.

Grammar School, Bradford, for 1,000 boys. Premiums, £300, £200 and £100. Assessor, Mr. Arnold Mitchell, F.R.I.B.A. Particulars, Mr. W. Brear, Secretary, Grammar School, Bradford, Yorks. Deposit £1 ls.

Closing Date, July 1.

Edwin Austin Abbey Memorial Scholarships. Particulars, Secretary, Edwin Austin Abbey Memorial Scholarships, Chelsea Lodge, 42 Tite Street, S.W.3.

Closing Date, July 1.

Cemetery Chapel, Reading. Limited to architects residing or practising in Berks, Bucks or Oxon. Premiums, 50 and 25 guineas. Assessor, Mr. Charles J. Blomfield, F.R.I.B.A. Particulars, Borough Surveyor, Town Hall, Reading. Deposit £2 2s.

Closing Date, August 23.

University Buildings, Western Australia. To cost £150,000. Premiums, £400, £300 and £200. Assessors, Prof. Leslie Wilkinson, F.R.I.B.A., Mr. A. R. L. Wright, L.R.I.B.A., President Royal Institute of Architects of Western Australia. Particulars, Agent-General for Western Australia, 115-116, Strand, W.C.2.

The Corporation of the City of London have in active preparation a scheme for rebuilding some of the official departments at the Guildhall, at a cost of about £50,000.

Sun Babies' Day Nursery, Hoxton

SIR CHARLES T. RUTHEN & Co., Architects.

This nursery, on a site at the corner of Felton and Norris Streets, Hoxton, overlooking the Regent's Canal, has been erected as a memorial to Muriel Viscountess Helmsley, and was opened by Princess Mary, Viscountess Lascelles, on May 4. It provides a refuge, in a densely crowded district of North London, for the many infants of mothers who go out to work daily in this industrial area. The building, which is of brickwork rendered on the outside, was designed to catch every glimpse of sunshine, and has two nurseries, each 50 ft. by 14 ft., open on one side

with glazed canopy over, one being for infants a few weeks old, the other for babies up to five years who are taught on nursery, school and Montessori lines. Accommodation is provided for 100 children and sleeping quarters for seven probationer nurses. A room for artificial sunlight treatment, a model wash-house and separate lavatory accommodation for the children, are included. Heating and cooking is by gas, and the finishings are on hospital lines, with simple mouldings, rounded corners, cover skirting

Sun Babies' Day Nursery, Hoxton

and cornices. There is a paved playground at the south end, and a fine lawn between the two nurseries.

The general contractor was Mr. William Simms, of 591 Commercial Road, E.1. Messrs John R. Venning & Co., Westminster (hot water installation and sanitary fittings); Messrs. The Novocrete Co., Ltd.,

London (Novocrete paving); Messrs. Ellis Partridge & Co., Leicester (slating); Messrs. The Brentford Concrete Construction Co., Ltd., Brentford (patent flooring); Messrs. The Eastern Armature Winding Co., London (electric light installation); Messrs. The London Gardens, Ltd., London (garden lay-out).

ARCHITECTS' REGISTRATION BILL

Proceedings of the Select Committee

WESTMINSTER, Thursday, May 26.

The Select Committee of the House of Commons who are considering the Architects' Registration Bill held a further sitting on Thursday of last week, when they heard the evidence of Mr. W. Forbes Campbell, President of the Association of Architects and Surveyors. Sir Clement Kinloch-Cooke, M.P., Chairman of the Committee, presided.

Before submitting his evidence, Mr. Campbell asked the permission of the Committee to refer to certain statements which had been made to the Committee at a previous sitting by Major Barnes, the witness for the Royal Institute of British Architects, the promoters of the Bill. Unless those statements were controverted, the case of his Association might be prejudiced in the eyes of the Committee. Major Barnes had been good enough to say a few kind words in regard to him (Mr. Campbell) and the officials of the Association; he said they were all persons whom it was a pleasure to meet. Speaking personally, witness required no praise from Major Barnes. He would place the most charitable interpretation on Major Barnes's evidence relating to the Association, and suggest that he was speaking without knowledge of the true facts.

Continuing, witness said he appeared for the second largest architectural association in this country. Major Barnes, in his evidence, admitted that the Association was as devoted to the cause of registration as the Institute and its allied societies, and witness entirely agreed with that expression of opinion. In fact, he trusted that, when his evidence was completed, the Committee would agree that the Association was even more devoted to the cause of registration than the august body represented by Major Barnes. In answer to the Chairman's questions inquiring whether there had been any real attempt on the Institute's part to co-operate with the Association or to allow them to co-operate with the Institute regarding the promotion of the Bill, Major Barnes had replied, "Yes, there had been very real negotiations carried on." To that reply witness would have something more to say later in his evidence. He might say at once that these negotiations were somewhat belated. The onus, as he would prove, lay with the Institute and not with the body he represented. The Bill was published on February 11. The negotiations between the Institute and the Association began on the 29th of that month and ended on April 6, so it would be appreciated that the Institute had fully made up its mind on the terms of the measure before entering into negotiations with the Association. Major Barnes stated that, as far as the administration of the Bill was concerned, he understood that the Association were satisfied with their inclusion on the Admission Committee and on the Board of Architectural Education. They were not satisfied, and they had all along insisted upon an independent statutory Board or Council. He would deny Major Barnes's statement that there was only one architectural body in this country which had tradition behind it or which had an appreciable number of the architectural profession behind it. In another part of his evidence Major Barnes stated that the Association was an off-split from another body. This was not in keeping with the facts; nor were they connected with any body known as the Faculty of Architects.

In another part of his evidence, Major Barnes had said his Institute were quite willing to give the Association every possible opportunity of safeguarding the rights of their members. The very reason that brought them before the Committee that day was to endeavour to obtain guarantees that the rights of the Association and its members would be safeguarded.

The Chairman: We are not here to give guarantees.

Witness said they wanted to endeavour to obtain them. In reply to the Chairman, Major Barnes had said in regard to the status of the Association that "in a certain sort of way"—whatever that might mean—the Association occupied a kind of intermediate position between the Royal Institute and the Surveyors' Institution. He followed by saying that the Association were a kind of composite body which took in both architects and surveyors, and that again, in itself, was another reason why the Association should not be regarded as a member of a general architectural body. To these statements he (Mr. Campbell) would reply that his

Association was made up of architects pure and simple, surveyors pure and simple, and quantity surveyors pure and simple. The percentage of membership was as follows: Architects, 70 per cent.; surveyors—*i.e.*, persons who practised as surveyors only and not as architects—25 per cent. and quantity surveyors, about 5 per cent. Of course, some of their architect members practised as surveyors also, but the same applied to the R.I.B.A., for many of their members practised as architects and surveyors. It would be further appreciated, from the figures given, that the Association was mainly, if not purely, an architectural body and in this respect it did not differ from the R.I.B.A. except that, by the rules of the Association, quantity surveyors were not allowed to practise as architects, whereas the R.I.B.A. allowed their members to act as quantity surveyors. This, he might say, was a bone of contention in the profession that only the Association had endeavoured to solve. To show the belated manner in which the Institute had carried on their negotiations, he would draw the attention of the Committee to a part of Major Barnes's evidence in which he admitted that it was only last week the situation with regard to Northern Ireland was decided upon and a conclusion reached.

The Chairman: In order to save your time, I may say we have officially received from the North of Ireland people an intimation that they desire to be within the Bill.

Witness then referred to the matter of examinations. He said he was not altogether pleased with the trend of the questions and answers relating thereto. These questions and answers, to his mind, would convey the idea that only the Institute's examinations were to be accepted in the future as a preliminary to registration.

Referring to the amendments to the Bill suggested by the Association, witness said there had been little time for their Executive officers to prepare a *precis* of evidence and a schedule of amendments, having regard to the fact that the witness for the promoters had but a few days previously proposed many amendments. The Bill, as a result of these would be materially changed from the Bill which was before them at the time of the Second Reading. He was pleased to say, however, that they had been able to simplify somewhat their schedule of amendments without materially affecting the issues.

The first amendment had reference to the constitution of the Council or supreme authority. Under the Bill as it had reached the Select Committee, this was to be vested solely in the Royal Institute. Witness submitted that such a proposal was contrary to the tendency of modern legislation which, as a rule, constituted independent statutory Boards such as the Dental Board. The present Bill did not contain any provision for the constitution and procedure of such a Board. They had, therefore, drawn up a third schedule to the Bill containing suggestions in regard to the composition of the Board. It would be observed that representation had been given to all professional societies whose members might be affected by the measure. A large representation had been given to the Royal Institute, including its allied societies and, as the second architectural body, the Association submitted that they should have the second largest representation, and certainly a larger representation than other societies whose interests were not so directly concerned. In this respect, the Association, although its membership was numerically less than that of the Royal Institute, was rapidly growing. Its membership was already a substantial one, and, as such, was entitled to adequate representation on any permanent Council that might be set up. Another argument in favour of such a proposal was that, by a slight alteration to Clause 10, a person who was refused admission to the register could be empowered to appeal to the Council, who should hear him. Such a plan would provide an intermediate court, which might render an appeal to the High Court unnecessary, except in exceptional cases. As at present proposed, the financial cost of an appeal might prove an unjust deterrent to an aggrieved appellant. As an example of an independent Board he would like to cite an example in South Africa. In the Union of South Africa an Architects' Registration authority had been set up and was composed of representatives from each of the architectural societies in the Union. Further

more, when the Bill for the registration of architects in South Africa was drafted, each architectural society was invited to co-operate in its drafting. Major Barnes had not made out a good case for his contention that the Royal Institute should be the supreme authority or governing body.

The Institute recognised other professional bodies in Schedule 2 of the Bill, and included in these were several old and highly respected institutions whose status was equal to that of the R.I.B.A. There was, for instance, the Institution of Civil Engineers, the Surveyors' Institution, the Society of Engineers, the Institution of Municipal and County Engineers, and the Institution of Structural Engineers, all with very large memberships. All these bodies possessed members who claimed the right to use the title "architect," and many of them, no doubt, were justified in doing so. The promoters of the Bill were apparently anxious to obtain their assistance on the Admissions Committee, and why should not these bodies have representation on the supreme Council? Then there was his Association. The promoters agreed that they were entitled, not only to representation on the Admissions Committee, but that they were worthy of inclusion among the learned societies sitting on the Board of Architectural Education. He submitted, therefore, that they were worthy to be included on the Council to be set up under the Bill. If they were not worthy, they ought not to function on any Committee.

They had special objection to the R.I.B.A. being the supreme body. He had in mind the attitude of splendid isolation displayed by the Institute in their correspondence with the Association relative to the Bill. Six months before the Bill was presented to Parliament, the Association made an offer to the Institute to co-operate with and assist them in the preparation of a Bill. The Institute did not accept the offer, and gave the Association no opportunity to express their views before them. It was not until nearly four months after their first application that the Association received a copy of the proposed Bill. The Bill was a flagrant example of an attempt on behalf of the Institute to exercise a monopolistic and dictatorial control over the profession. When the first draft Bill was circulated, strong objections to its terms were raised, not only by his Society, but by other Societies, and a second draft Bill appeared. Pressure must have been brought to bear on the promoters, for a third Bill was prepared, and this was the Bill presented to Parliament. Up to the time of the issue of the second draft Bill, his Association had been ignored, and it was not until his Council intimated that they would resolutely oppose the measure as it stood that the promoters met them in conference. But it was then too late to effect any material change in the Bill. The Association's request that the Council should be an independent statutory body was a fair request, and it should be granted in the interests not only of the professional bodies concerned, but of the general public.

Witness then came to the second amendment suggested by the Association, as to persons entitled to be registered without examination (Clause 5). He said his Association considered that present members of the Institute, including, of course, its allied societies and architect members of his Association, should be included in this clause. If the Bill became law, the duties of the Registrar would undoubtedly be very heavy, at any rate during the first year of office. At one of the conferences held between the Royal Institute and the Association he (witness) suggested to Major Barnes that a tremendous amount of the Registrar's work could be saved if their respective bodies forwarded lists of members who were qualified for registration to be registered *en bloc*. Major Barnes agreed that this suggestion was a sound one, and witness now submitted that provision should be made in the Bill to carry this into effect. After all, it only affected practitioners who had already satisfied their respective societies that they were *bona fide* architects. If the Registrar objected to an individual, he had power under the Act to refer the matter to the Admissions Committee. To avoid the necessity of a practitioner having to pass an examination for entrance to the Association and then having to pass another for registration, or *vice versa*, it was submitted that the passing of the Association's examination (or the Institute's or that of any other approved body), provided such examination was approved by the Board of Architectural Education, should qualify a person for registration.

With regard to the Admissions Committee (Clause 3), as at present provided, this Committee was given a limited

life. The Association considered it should be a permanent committee, especially as it would undoubtedly function as an inexpensive appeal tribunal for persons who had been refused registration by the Registrar. Another of their amendments provided for extra representation of the Association and the Association of Architects, Surveyors and Technical Assistants. His Association was, and always had been, in favour of the payment of a nominal fee for registration by the person registered. Later in his evidence he would state that the Association desired registration to be compulsory and not optional. If the suggestion for an independent Council were adopted, the annual fee for registration could be decided by agreement between the various bodies represented. He thought it safe to reckon that, with so many professional bodies represented, the fee would be kept as low as possible. So far as the Association was concerned, they were prepared to pay the fees for registration of their members, and he thought their example would be followed by other societies. Persons practising other professions had to pay annually for a licence. The auctioneer paid £10, an appraiser and house agent £2, and even a pedlar had to take out a licence. If these considerations were borne in mind, he saw no reason why an architect should object to the payment of a nominal annual fee for registration.

The Association naturally felt that they ought to be represented on the Discipline Committee, in view of the fact that some of their members might be affected. If the R.I.B.A. Council became the Council under the Bill, there was little doubt that the members of the Discipline Committee appointed by the Council would be Institute members. It was the desire of the Association that Clause 11 of the Bill should stand. They were prepared, however, to delete the words "architecture" or "architectural." If Clauses 11 and 12 of the Bill were amended as suggested by the promoters of the Bill, the Bill would become practically worthless. The effect of the amendment, if adopted, would be to permit any person, however incompetent, to call himself and practice as an architect without let or hindrance. But a class of "registered architects" would be created who, on the contrary, would be subject to the jurisdiction of the Registration authority and who would have to pay for its upkeep. It seemed obvious that, while "registered architects" would not be able to practice with the same freedom as their unregistered confreres, the only incentive offered to them was the lure of the word "registered." No one troubled nowadays whether a plumber called in to do a job was a "registered plumber" or just a plumber. Was it likely, therefore, that the building owner would concern himself as to which category of architect his proposed consultant belonged? If "registered architect" was to be soon recognised as being superior to "architect," did it not follow that engineers and officials of various bodies, many of them highly competent men, would not content themselves with the inferior designation of plain "architect," but would take the necessary steps to become "registered architects." The proposed amendment could therefore be of no use to competent men, but would allow the unqualified to mislead the public by representing himself to be and using the designation of "architect."

In conclusion, witness referred to the question of education. The Association, he said, had spent considerable time and thought in evolving a scheme of progressive education, and they had kept in mind the necessity of leaving open an avenue whereby working-class boys and girls might attain to the practice of the profession of architecture. He trusted the Bill would be so amended as to afford his Association and their societies the opportunity of carrying into effect a system of examinations which would enable such boys and girls to practise the profession.

The Chairman: I am sure we are very grateful to you for putting your case before us so lucidly.

Colonel Moore: Do I understand you to say that you had no actual conference with the Institute until just before the second reading of the Bill?

Witness: We had one conference prior to the second reading.

Colonel Moore: Did the negotiations emanate from you or from the Institute?

Witness: We had a draft Bill sent to us.

Colonel Moore: I gather you met overt obstruction from the Royal Institute on the matter of amending the Bill?

Witness: Undoubtedly there was an attempt. My point is that, from last August right up to this year, we were absolutely ignored. We have correspondence to show that

we tried to get into touch with the Institute since last August without result.

Colonel Moore: There was no explanation from the Institute as to their objection to meeting you?

Witness: There was a conference, but nothing beyond that.

Replying to a series of questions by Mr. Gardner, witness said he contended that the Admissions Committee and the Discipline Committee and the Board of Architectural Studies were sub-committees of the Supreme Council, who were naturally governing the whole of the administration in the future of the profession. The Association asked that the Admissions Committee should function permanently. Major Barnes had had in mind the difficulty of men who were architects 30 or 40 years ago and who wanted to go back to their first love. The association contended that, by a slight amendment of the Bill, any man who had a claim could apply to the Registrar, who could refer him to the Admissions Committee. So long as such claimants were likely to come forward, the Admissions Committee should be kept in being.

Mr. Gardner: What are the qualifications by which your Association call men architects?

Mr. Campbell: Applicants must prepare full details in a form, including particulars of early training. In addition to that, we insist upon some of his recent work being shown. There was no examination.

Mr. Tasker: I understand from you that the Council of the Royal Institute are thinking of controlling the whole of the architects in this country?

Witness: Very shortly, that is the case.

Replying to Captain Wallace, witness said he would oppose the Bill if it did not entail compulsory registration.

Captain Wallace: The regulations under the Bill have to be approved by the Privy Council. Is not that a safeguard?

Witness: That is not the point. The thing is that we do not want anybody to have absolute control.

The Chairman: You must answer the question put to you.

Captain Wallace: Would you not regard the necessity of submitting the regulations to the Privy Council as a safeguard?

Witness: We do not say there would be any abuse.

Sir A. Hopkinson: How long has your Association been in existence?

Witness: Eighteen months.

How many members were there to start with?

I think there were few to start with.

How were you incorporated?

It would involve my giving you a very lengthy statement.

Perhaps you can tell us what members you have who are known in the architectural world?

I would like an opportunity of submitting a statement.

Witness's secretary interposed to say that the Association did not start with such members as Sir Edwin Lutyens or Sir Reginald Blomfield, but they had Mr. Frank Brangwyn among their members.

The Committee then adjourned until Tuesday.

WESTMINSTER, Tuesday, May 31.

When the Select Committee sat to-day Mr. Forbes Campbell continued his evidence, and he submitted a memorandum on qualifications for membership of the Incorporated Association of Architects and Surveyors. It stated that the Association was founded and incorporated in September, 1925; the work of organisation of administrative services, etc., occupied several months; and the work rendered necessary by the Architects' Registration Bill has considerably hampered the Association's activities in other directions, more especially in regard to educational matters and examination schemes. However, time has been found to form a Committee to advise the Council of the Association on the latter matters, and schemes formulated by this Committee are nearing completion. Pending the completion of this work, it was deemed necessary to establish a system whereby membership should be confined to persons whose experience, backed by credentials, provided irrefutable proof of their qualifications to practice in the professions of an architect and/or surveyor. In furtherance of this decision, an Applications Board was set up, and the procedure is hereinafter indicated.

There are two degrees of membership, *i.e.*, Fellows and Associates, which are sub-divided so as to cover each of the

three main sections of the professions, *viz.*: (a) Architects, (b) Surveyors (Land and Building), and (c) Quantity Surveyors. In addition there is another grade of membership for "Registered Students."

QUALIFICATIONS FOR MEMBERSHIP ARE.—*Fellows*: Applicants must be over the age of thirty and have been in practice or held an official position for a period of at least seven years, and must be otherwise able to satisfy the Council of their qualifications and experience.

Associates: Applicants must be over the age of twenty-one and have been in practice or held a responsible position with a qualified practitioner for a period of at least four years, and must be able to satisfy the Council of their qualifications and experience.

Registered Students: Applicants must be over the age of sixteen, have obtained a standard general education equivalent to the Oxford and Cambridge Local Examinations or other approved Examinations, and (a) be attending a recognised technical institute or school of architecture or surveying; (b) be an articulated pupil or assistant with a bona-fide practitioner and at the same time be taking a course of instruction in professional subjects.

An application for election to membership is normally sent to the General Secretary. On receipt of an application a form is despatched to the applicant for completion and return. Such a form properly completed contains the following information:—(1) The grade of membership sought, *i.e.*, Fellow, Associate or Registered Student; (2) the branch of membership sought, *i.e.* (a) Architect, or (b) Surveyor, or (c) Quantity Surveyor; (3) the applicant's full name; (4) residential address; (5) address of business; (6) date of birth; (7) particulars of education; (8) articles and training; (9) technical education; (10) technical examinations passed; (11) actual experience; (12) profession practised by applicant; (13) if in practice on own account and how long; (14) nature of any other business, or profession (if any); (15) if employee—name and address of employer; (16) if a member of any other organisation giving full particulars, including degrees held and examinations passed. In addition the applicant must forward plans and specifications, vouched for as being his own work, and must produce two references from architects or surveyors (as the case may be) in regard to his qualifications to practice and general character.

Preliminary investigations are then made by the General Secretary; references are taken up and a local correspondent (a member of the Association), if available, is asked to submit a report in regard to the applicant.

The application of the candidate is then brought before the Applications Board, who carefully consider same and the candidate's practical work is examined. The Board when satisfied with the qualifications and bona-fides of the applicant, proceeds to elect him under the appropriate heading, and he is designated accordingly. Where doubt exists the applicant is asked for further particulars; if he resides in or near London, he is invited to present himself at the next sitting of the Board, or if he lives at a distance a senior member of the Association in the locality is requested to interview the applicant and to report. Arrangements have also been made whereby an applicant who has been rejected can, on appeal, submit his case to the Executive Committee, and, if necessary, to the Council, for a final decision.

Reference has been made (the memorandum continued) herein to the Board which decides applicants' eligibility or otherwise, for membership. The Board is drawn from a panel of fully qualified men, and at each meeting one or more, usually two, representatives of each of the branches of the allied professions, *i.e.*, an architect, a surveyor and a quantity surveyor (in addition to the Chairman), are in attendance. Let it be said that many members of the older bodies, principally the R.I.B.A., have shown the greatest courtesy in sending testimonials and answering inquiries in regard to applicants in their employ or otherwise known to them, and permitting plans and drawings, executed by applicants, to be sent out of their offices for the Board's inspection.

The result of the system adopted has proved highly satisfactory in practice. The careful investigation into an applicant's bona-fides has been favourably commented upon by independent and impartial persons. In this respect an extract from a letter received from a distinguished architect, a Fellow of the Royal Institute of British Architects holding a very important Government appointment abroad

CHEERFULNESS AND UTILITY

Tiles which tone with the weather, and add a note of cheerfulness to otherwise dull surroundings are welcomed by most Architects. Marseilles Tiles help to make your houses bright and cheerful and they also tone down delightfully.

They are reliable, easy to lay and inexpensive—their first cost is extremely low. In order to obtain genuine Marseilles Tiles you should specify "Marseilles Roofing Tiles to be obtained from LANGLEY LONDON LTD., of 161 Borough High St., London, S.E.1."

MARSEILLES

ROOFING TILES

may be cited. He says: "May I be permitted to express satisfaction that you are making careful enquiry. Some years ago I protested against the ease with which local applicants could enter all sorts of societies and not necessarily architectural ones. There did not appear to me to be the same amount of investigation as would be made in the case of English applicants."

Sir A. Hopkinson asked witness for the Association's Memorandum of Association. He desired to know if it contained the names of the subscribers. Witness said he did not expect to be asked for that.

The memorandum was produced and handed to the Committee.

Sir A. Hopkinson: Has your Association made any provision for architectural education?—Certainly.

Where?—We are not at the stage yet of stating that.

I want to know where the classes are being held?—We have no regular classes.

And no lectures?—No.

As far as you know as President, you have no classes and no lectures?—We have no specific classes, but we are making thorough investigation into the state of matters.

I want to know how much you knew about architectural education. At present you are doing nothing?—I would not say that. I say that we have been investigating it.

Sir M. McDonald: Of course, the Association has only been in existence eighteen months, and that is why they have not, perhaps, got on their feet.

Sir A. Hopkinson: I am only asking for information.

The Chairman (to Sir M. McDonald): You must allow Sir Alfred to ask his questions in his own way. We cannot have members of the Committee suggesting excuses or anything else.

Witness: I feel sure that Sir Alfred is so interested in the education of architects that I should like to give him every opportunity of asking questions.

Sir A. Hopkinson: What are your qualifications for membership?—Witness: At the present moment there is an admission fee, and there is varied investigation into every particular applicant.

Do you know what the schools are in which architectural instruction is given at the present time in Scotland and England?—In Glasgow there is, for instance, the Royal Technical School. I do not know a great deal about the leading schools in England.

Sir A. Hopkinson: What do you know of the London schools and colleges?—Witness did not reply.

The Chairman: Will you answer the question? Say if you know or if you don't know.

Sir A. Hopkinson: If you don't know it is very simple to say so. Many of us are ignorant about many things. I will not press it. Will you tell us what an architect is?

Mr. Hirst: I want to find out why this Association was necessary. I am not satisfied yet that reasonable evidence has been given on that point.

Mr. Tasker: Could not you accept the definition of an architect as being a skilled professor in the art of building whose business it is to prepare plans which simplify the erection of the building?—That is quite a fair definition.

Would not that be a fair definition to apply to the engineer?—It is a matter that should be carefully investigated.

Col. Moore: Are the members of your Council selected because they are known to practice their professions at the moment?—Yes.

There are no further tests?—No.

The Chairman asked witness to supply a printed list of his Association's membership. They had asked the same from the R.I.B.A. The Committee would also like to have copies of balance-sheets, copies of any journals published, and any other publications they might have, as well as statistics as to the architect membership.

Mr. Tasker: I am afraid we shall be overwhelmed with papers.

Witness said his Association was quite willing to give all possible information to the Committee, but they did not want it broadcast.

In reply to other questions, witness said the Committee were asking for a great deal of information which even the Royal Institute had not given.

Mr. Bignall, Chairman of the Association's Board of Architectural Studies, was then examined.

Sir A. Hopkinson: Have you any relationship with any of the schools of architecture?—Witness: Not at the

moment, because we are still drawing up our scheme of examinations.

Can you tell us any well-known architects who have joined in framing the scheme?—The City Architect at Crewe.

Have you the name of any architect who is known in the architectural world or in the artistic world?—Witness did not reply to the question.

Sir A. Hopkinson: You would rather not answer that question?—We have in the composition of the Board men connected with education.

I only want to know whether on this Board you have any architect of distinction.—Only the members of this Society.

Does that mean that, if they are members of your Association, they cannot be distinguished architects?—Not at all. We have tried to meet the case by asking representatives from each section.

The next witness was Mr. Harry John Hatley, of the Incorporated Society of Auctioneers and Landed Property Agents. Witness said he agreed with the principle and the necessity of registration in the case of architects, and he examined various clauses of the Bill in the light of the Society's views on the Bill.

Taking Clause 2, witness said this clause interpreted the Council as being the Royal Institute of British Architects. If this stood, all the functions of the Council which affected the public and many other architectural societies would be vested in one society. That would not be either just or fair. His Society agreed with the amendments provided by the Incorporated Society of Architects and Surveyors; that the Council should be constituted in the manner prescribed in the Third Schedule as set out by them. In the case of Clause 5, his Society considered it should be ensured that no qualified architect, practising bona fide as an architect, should be debarred from registration by reason of his being associated with other businesses or professions alien thereto.

Unless Sub-clause 2 was not widened, an architect practising in a small town as a general practitioner might be ruled by the Admission Committee as unfit for registration. They suggested the following new clause: "Nothing in this Act contained shall authorise the Admission Committee to refuse registration on the ground that an applicant, although practising as a bona fide architect, is also associated with other businesses or professions allied thereto, and, further, before the Admission Committee decide that a person is not entitled to registration, they shall give such person an opportunity of appearing before them and stating his case." His Society felt that the fact of any architect member having prior to, not after, the passing of the Act, satisfied his Society as to his qualifications for joining his Society, and that he was a bona fide practising architect, should be in itself sufficient to admit him for registration without questions being raised under Sub-clause 2. His Society considered that the Admission Committee should not solely consist of representatives of one architectural body, but should be strengthened, and he agreed with the amendment proposed by the Incorporated Society of Architects and Surveyors. In regard to Clause 10, his Society favoured a less costly means of appeal, and power to appear before the Council and then proceed to the High Court.

As to the use of titles, witness said that an applicant for registration might have an appeal pending against the decision of the Admission Committee, and, as the clause stood, he might be prevented from practising for a year. This was not reasonable. As to the proviso in favour of local authorities in relation to persons performing acts or operations in connection with the construction of buildings, this seemed to the Society to nullify the objects of the Act, because it allowed local authorities to leave to unqualified men the important work of passing plans for houses and other buildings and improvements, and also to leave unregistered and perhaps unqualified persons to continue to act as architects.

The Committee then adjourned till after the Whitsuntide recess.

The Southern Railway have commenced a new widening scheme for their main line at Beckenham, which is estimated will take twelve months to complete and cost about £100,000.

The Development of an Ideal in Craftsmanship

XV Century Carrock or Galleon; 150 tons; 3 masts: fore, main and mizen. Tiller, rudder and fore-and-sterncastles part of ship construction.

If it were possible to actually achieve an ideal in Craftsmanship—all future progress would automatically stop. Each age has striven towards the ideal and aimed at the highest possible expression of its art; yet another generation has further developed the ideal upon the guiding principles already laid down. As a case in point we illustrate how the XV Century ship here illustrated—is yet a further development in its period of the XIII Century ship illustrated last week.

* * *

Industrial developments move yet faster to-day—whether in Ships or Electrical Switches. Electricity is essentially a modern industry, and its ever-increasing development calls for ever-increasing enterprise for those who cater for its requirements. Sound principles based upon the experience of the past—alert enterprise to adapt those principles to the accessories of to-day—continual research and experiment towards anticipating the needs of to-morrow—veritable essentials of progressive Craftsmanship as understood by—

“Craftsmen in Electrical Switches”

A SUGGESTION

MAY we suggest that before purchasing Fireplace Suites or Sanitary Appliances you and your Clients should visit our recently re-arranged Showrooms at 17 & 18 Upper Thames Street, London, E.C.4.

The range of Fireplace Suites offered for inspection is a very wide one. A special feature is the number of beautiful Period Designs, many of which we owe to our own craftsmen of a century ago.

The Register Grate illustrated is in Armour Bright finish and fitted with the Hot Hearth Fire. It is particularly suitable for office or country house use.

London Building Notes

BASINGHALL STREET.—The Court of Common Council have under consideration the rebuilding of office premises at the rear of the Guildhall, in Church Alley, the cost of which is estimated at £53,500. The new building will be of four storeys and basement, and has been designed by Mr. Sydney Perks, F.R.I.B.A., City Architect, Guildhall, E.C.2.

CHURCH STREET.—A block of self-contained flats, five floors in height, with four shops on the ground floor, are to be erected in Church Street, Kensington, W., to the design of Messrs. Wills & Kaula, F.F.R.I.B.A., 3 Southampton Street, W.C.1. The building work will be carried out by Messrs. Leslie & Co., Ltd., Kensington Square, W.8. The elevations will be in red brick with stone dressings.

CITY OF LONDON.—The City Lands Committee have now prepared a scheme for rebuilding the Public Health Department committee room and the offices of the city engineer at the Guildhall, the cost being estimated at £53,000.

COLINDALE.—The E.C. have decided to proceed at once with the erection of the proposed new elementary school on the Watling estate, the cost being estimated at £40,000. Plans have been prepared by Messrs. Welch & Hollis, A.A.R.I.B.A., 7 New Square, Lincoln's Inn, W.C.2.

GREENCOAT PLACE.—A building, five storeys in height, is to be erected upon a site in Greencoat Place and Willow Street, S.W.1, to provide 41 suites of flats for the accommodation of working-class people. Work is about to be put in hand under the direction of the architects, Messrs. H. V. Ashley & Winton Newman, F.F.R.I.B.A., 14 Gray's Inn Square, W.C.1.

HAMMERSMITH.—The governors of the West London Hospital, in Hammersmith Road, W.6, announce their intention of proceeding at the earliest possible moment with the building of a new casualty department, whilst an extension of the nurses' home would also be probably carried out this year. An open-air balcony to the children's ward has just been begun. The architect to the Hospital is Mr. A. Alban H. Scott, F.R.I.B.A., Old Square, Lincoln's Inn, W.C.

HORNSEY.—The Midland Bank, Ltd., Lombard Street, E.C.3, has acquired premises at No. 139 Stroud Green Road, Hornsey, N., which it is proposed to open as a branch office as soon as the necessary alterations have been completed. The work will be shortly put in hand under the direction of the bank's architects, Messrs. Whinney, Son & Austen Hall, 8 Old Jewry, E.C.2.

ILFORD.—Negotiations are proceeding for the disposal and development of extensive building land at Ilford, at the corner of Brook Street and five other streets and shop plots at the corner of Eastern Avenue. The surveyors are Messrs. Alfred Savill & Son, Lincoln's Inn Fields, W.C.

KENSINGTON.—Extensive alterations, redecorations, etc., are to be made to

Nos. 159-163 Lexham Gardens, Cromwell Road, S.W., in connection with the conversion of the premises into a private hotel. The builders are Messrs. Austin, West & Co., 13 Victoria Street, Westminster, S.W.1, the steelwork being supplied by Messrs. Young & Co., 6 Queen Anne's Gate, S.W. The plans have been prepared by Messrs. Williams & Cox, F.F.R.I.B.A., 34 Henrietta Street, Strand, W.C.

KENSINGTON.—The large property known as No. 21 Queen's Gate Place, Kensington, W., is to be converted into 3-4 suites of flats, involving extensive structural alterations, redecorations and equipment. Plans have been completed by Messrs. Mason & Mason, 2a Kensington High Street, W.8.

KINGSWAY.—The foundation stone for the new Masonic Temple in Great Queen Street, W.C.2, will be laid by the Duke of Connaught, Grand Master, on July 14, after which date arrangements will be made for an actual commencement of building work. The new building, which will cost £1,000,000, has been designed by Messrs. H. V. Ashley and Winton Newman, F.F.R.I.B.A., Gray's Inn Square, W.C.

LEWISHAM.—The L.C.C. Education Committee have decided to proceed with the foundation work of the fourth elementary school at Downham, and the work is to be entrusted to Messrs. Holland, Hannen, & Cubitts, Ltd., at an estimated cost of £3,800.

MAYFORD.—The L.C.C. are to improve the heating and lighting at the Mayford special school at a cost of £3,800.

NORTH FINCHLEY.—The London Telephone Service have acquired a site at Church End, North Finchley, N., where it is proposed to build a new branch post office and telephone exchange. The building work is to be put in hand at once under the supervision of H.M. Office of Works, Storey's Gate, Westminster, S.W.1, whose chief architect is Mr. R. J. Allison, F.R.I.B.A.

OATLANDS PARK.—Extensive residential property is being erected upon the Oatlands Park estate, whilst arrangements for the development of further portions of the area are now being made. The arrangements are in the hands of Messrs. Crickmay & Sons, architects, 13 Victoria Street, Westminster, S.W.1.

PADDINGTON.—The old public-house at the corner of Praed Street and London Street, W.2, adjacent to Paddington Railway Station, owned by Messrs. Watney, Combe, Reid, & Co., Ltd., brewers, and known as the "Load of Hay," is to be pulled down. Upon the site is to be built a large licensed hotel, containing public rooms, 50 bedrooms, etc., costing £110,000. Plans are now being prepared by Mr. G. G. Macfarlane, surveyor to the Stag Brewery, Westminster, S.W.

PECKHAM.—New shop premises are to be erected upon the site of Nos. 138-144 Peckham High Street, S.E., for occupation by Messrs. John Quality, Ltd., grocers. Plans have been prepared by the Works Depart-

ment of Messrs. Selfridge & Co., Ltd. Oxford Street, W.1, whilst the building is being undertaken by Messrs. Rice & Son, 15 Stockwell Road, Brighton, S.W.

SILVER STREET.—The committee controlling the North Middlesex Hospital in Silver Street, N.18, are considering the question of erecting a new operating theatre, whilst further improvements are also projected. Plans have been prepared by Mr. J. C. Mummery, A.R.I.B.A., 34 Bloomsbury Square, W.C.2.

SOUTH KENSINGTON.—Nos. 2 and Queen's Gate Gardens, S.W., consisting of large family residences of good type, have changed hands, and are to be converted into suites of residential flats. Plans are under the direction of Messrs. Charles Saunders & Son, 40 Gloucester Road, Kensington, S.W.7.

SOUTH KENSINGTON.—The "Hoc and Toy" public-house, near South Kensington Station, is now being pulled down, and will be rebuilt by Messrs. Huggins & Co., Ltd. The general contractors are Messrs. Kirby & Kirk, Ltd., and the new building has been designed by Mr. Alfred Burrows, F.R.I.B.A., architect, of 85 Gower Street, W.C.1.

TOOTING BROADWAY.—Messrs. Lloyds Bank, Ltd., are to open a new branch at premises in Tooting Broadway, S.W., and the necessary alterations, etc., have now been commenced. The contractors are Messrs. E. Saunders & Co., 234 London Road, Croydon. Plans for the new bank have been prepared by Messrs. Home Knight, A.A.R.I.B.A., 37 Russell Square, W.C.1.

TOTTENHAM COURT ROAD.—It is hoped to make a start upon the erection of the new club and central headquarters in Tottenham Court Road, W.1, projected by the Young Women's Christian Association. The site has been secured, and a large proportion of the cost of the building—£250,000—is now in hand. Plans are in course of preparation, the architect being Sir Edwin Lutyens, R.A., 1 Queen Anne's Gate, Westminster, S.W.1.

WESTMINSTER.—Foundations have now been completed for the large block of flats—78 in number—which are to be built upon a large site in Esher Street, S.W.1, for the City Council. The new tenement block has been designed by Messrs. H. V. Ashley and Winton Newman, F.F.R.I.B.A., 14 Gray's Inn Square, W.C.1. The builders are Messrs. George Walker & Slater, Ltd., Uttoxeter Old Road, Derby.

Correction

The alterations and improvement including new shop fronts, to be made at No. 155 Oxford Street, W.1, under the supervision of Messrs. Waite & Waite, surveyors, Great Castle Street, W.1, will be carried out by Messrs. George Parnall & Co., Ltd., whose address is at Evelyn House, 62 Oxford Street, W.1, and not as incorrectly given in our previous issue.

SOME TRADITIONS OF
THE PLASTERER'S CRAFT

*Drawn by D. M. Cafferata.
Historical data by George Bankart.*

THE life size relief figures in stucco on the now demolished Nonesuch Palace at Cheam, were done by Toto-del-Nunziata (Antony Toto) of Florence. King Henry VIII made Toto his "Sergeant Painter" in 1539—one year after the Palace was begun.

Stucco mortar formerly required laborious preparation and years of maturing. Portland cement is quickly prepared, worked with great ease and makes a permanent, weather-proof stucco when mixed with

The Week's Building News

The following abbreviations are used: U.D.C. for Urban District Council; T.C. for Town Council; R.D.C. for Rural District Council; E.C. for Education Committee; B.G. for Board of Guardians; P.C. for Parish Council; B.C. for Borough Council; M.H. for Ministry of Health; M.T. for Ministry of Transport; C.B. for County Borough; B.E. for Board of Education. Direct confirmation should be obtained before commitments, for which we cannot be responsible, are made.

ACCRINGTON.—Messrs. Burtons, Ltd., of Leeds, have acquired a site at Piccadilly for the erection of new premises. The contract has been placed with Messrs. G. Cunliffe & Sons, Ltd., builders and quarry owners, Sydney Street, Accrington. The contract for the steelwork has been let to Messrs. Redpath, Brown & Co., Ltd.

ARNOLD.—The U.D.C. have instructed the surveyor to prepare plans for 20 houses, to be erected on the Grove Estate.

BARROW-ON-SOAR.—The R.D.C. are to erect 20 houses at Anstey, and a loan of £8,050 has been sanctioned. Lay-out plans were approved for 14 houses at Mountsorrel and 20 at Sileby. The architects are Messrs. Symington & Prince, A. & L.R.I.B.A., Market Street, Leicester, and Messrs. Robinson & Phipps, Midland Chambers, 39 London Road, Leicester.

BINGLEY.—Mr. F. Atkinson, L.R.I.B.A., Old Bank Chambers, Bingley, has been appointed architect for rebuilding dance hall and café for the Goit Stock Café and Pleasure Ground Company, Harden Valley, Cullingforth, Bingley.

BIRKENHEAD.—The Corporation have obtained sanction to borrow £36,517 for carrying out the scheme of conversion and reconditioning of Queen's buildings, and the borough surveyor has been authorised to proceed with the scheme and to obtain, where possible, tenders for carrying out portions of the work.

BOLTON.—The directors of the Dove Spinning Company, Limited, cotton spinners, Deane, near Bolton, are proposing to make extensive additions to their mill premises. The plans have been prepared by Messrs. Stott & Son, architects and surveyors, 5 Cross Street, Manchester. The contract has been placed with Messrs. W. Gornall & Son, Ltd., builders and contractors, Ellesmere Street, Bolton. Steelwork by Messrs. Robinson & Kershaw, Ltd., constructional engineers, Temple Iron Works, Manchester.

BOLTON-ON-DEARNE.—The tenders of Mr. R. D. Donaldson and Mr. O. Weaver have been accepted for the erection of a Post Office, 2 shops and dwelling-houses, and 20 houses at Goldthorpe. The plans and quantities have been prepared by Mr. W. H. Adams, A.R.I.B.A., architect and surveyor to the Council.

BRIGHTON.—The borough surveyor has submitted lay-out and house plans for the erection of a further 184 parlour-type houses on the remainder of the North Moulsecomb Estate, at an estimated cost of £101,200. The Housing Committee are to invite tenders.

CADISHEAD.—Mr. R. Martin, architect, of 90 Deansgate, Manchester, has prepared the plans of the new church. Messrs. Brew Bros. are the contractors.

CARDIFF.—The City Council have decided to ask the B.E. to sanction the erection of another school on the Ely

Housing site. The engineer, Mr. G. Whitaker, estimates the cost at £27,000. Accommodation will be provided for 1,888 scholars.

CHELMSFORD.—The E.C. have instructed the borough engineer to prepare plans for the erection of a new public elementary school on the site recently purchased by the Council in Lady Lane, on similar lines to the school now being erected in Kings Road.

CONGLETON.—Plans have been prepared by Messrs. Mellor, Speakman & Hall, Cooper Street, Manchester, for the enlargement of the Congleton War Memorial Hospital by the erection of a new wing.

DAGENHAM.—Essex E.C. have approved sketch plans for the erection of an eighth school, for 1,350 children, on the Vallance section of the Dagenham Housing Estate. A site is being obtained for a ninth school. The architect is Jno. Stuart, Esq., F.R.I.B.A., county architect, Old Court, Springfield, Chelmsford.

ELLESMERE PORT.—Sir McAlpine & Co., Ltd., builders and contractors, of London and Manchester, have secured the contract for the new Transit Sheds at Ellesmere Port, for the Manchester Ship Canal Co., Ltd. Plans prepared by the M.S.C. engineers, at 49 Spring Gardens, Manchester.

FINCHLEY.—New schools have been designed by Mr. T. H. B. Scott, architect, 11 Finsbury Square, London, E.C., for the parishes of St. Mary, St. Philip, St. Alban, Finchley and St. Mary's, Whetstone.

HANLEY.—Stoke-on-Trent Corporation Markets Committee have considered the question of the improvement and bringing up to date of the Hanley abattoirs. The Committee approved the general sketch plan submitted by the city surveyor, and also decided that the city surveyor prepare complete plans, together with estimates for the necessary work. The city surveyor is to include in the plans provision for a refrigerator or cold store.

HEDNESFORD.—A new Catholic Church is to be erected on a site in Uxbridge Street, Hednesford, at an estimated cost of £30,000. The plans have been prepared by Messrs. Harrison & Cox, F.R.I.B.A., 109 Colmore Row, Birmingham. The building will be constructed of reinforced concrete blocks.

HIGHGATE.—Mr. A. E. Munby, F.R.I.B.A., 9 Old Square, Lincoln's Inn, has prepared plans for extensions at Highgate School, Southwood Lane.

INVERNESS.—The directors of the Northern Infirmary, Inverness, have decided to begin the reconstruction and extension of the institution, which is estimated to cost £100,000. The architect is Sir John James Burnet, R.A., LL.D.

LEICESTER.—The Corporation now propose to proceed with the establishment of the new cemetery on Saffron Hill, for which the Corporation

recently accepted the design of Messrs. Thomas H. Mawson & Sons, Lancaster and London, which won the first prize of £100, and was considered by Mr. H. V. Lanchester, F.R.I.B.A., London, the assessor, as the best design submitted. The Committee recommended that the cemetery should be laid out upon the "Lawn" principle, and that no raised graves be allowed. The Committee are to approach the Minister of Health for his consent to a loan of £50,536 4s. being obtained, and tender secured for the laying-out of the cemetery.

LIVERPOOL.—A further portion of St. Mary's College, Gt. Crosby, is to be erected. The plans have been prepared by Mr. Anthony Ellis, architect, the Temple Dale Street. The contract has been let to Messrs. William Tomkinson & Sons, 21 Dansie Street.

LIVERPOOL.—Messrs. Foden, Hemmings & Williams, the architects, of 11 Deansgate, Manchester, have a scheme in hand for the Rev. Father Timmor, rector of St. Patrick's, Liverpool, consisting of a memorial institute and schools, to be erected in Park Place, Liverpool, the site being opposite to St. Patrick's Church. The scheme is estimated to cost about £20,000.

MABLETHORPE.—The Mablethorpe Hotels, Ltd., Mablethorpe, Lincs., have acquired a central site at Trusthorpe, Mablethorpe, where they propose to erect a new hotel, estimated to cost £7,500. The plans have been prepared by Mr. George Richardson, High Street, Mablethorpe. The contract has been placed with Messrs. Busfield, builders, Radford Road, Nottingham.

MANCHESTER.—Messrs. Bradshaw Gass & Hope, F.R.I.B.A., 18 Silverwell Street, Bolton, have prepared plans for 6 lock-up shops and a workshop, to be erected at Lancaster Avenue and Todd Street, Manchester, for the City Properties (Manchester), Ltd.

MANCHESTER.—The London Guarantee and Accident Company, Ltd., of Spring Gardens, Manchester, are proposing to make alterations to the buildings to accommodate the Phoenix Assurance Company, with which company they are associated. The plans have been prepared by Messrs. Francis Jones and H. A. Dalrymple, F.R.I.B.A., architects, 178 Oxford Road, Manchester. The contract has been let to Messrs. Peace & Norquay, Ltd., builders and contractors, New Islington Works, Ancoats, Manchester.

MANSFIELD.—Notts E.C. have obtained sanction for a loan of £22,000 for the erection of a technical institute at Mansfield. The architect is Mr. Maggs, Shire Hall, Nottingham.

MILFORD HAVEN.—Pembrokeshire E.C. have purchased a site at Milford Haven for the erection of a central school. The architect is Oswain Thomas, Esq., L.R.I.B.A., County Education Offices, Haverfordwest, Pembrokeshire.

REINFORCED CONCRETE ENGINEERS

The Kahn System

THE ROSSCOR VIADUCT, IRELAND, IN REINFORCED CONCRETE ON THE KAHN SYSTEM.

County Surveyor: J. P. BURKITT, A.M.Inst.C.E.

Contractor: S. R. BOYD.

Resident Engineer: R. WESTROP GEORGE.

REINFORCED CONCRETE IS THE MOST ECONOMICAL METHOD OF CONSTRUCTION—IT IS PERMANENT, AND ELIMINATES MAINTENANCE CHARGES.

THERE IS A DISTINCT ADVANTAGE IN ENGAGING A FIRM OF REINFORCED CONCRETE ENGINEERS HAVING A LARGE STAFF OF EXPERT DESIGNERS AND WITH MANY THOUSANDS OF SUCCESSFUL CONSTRUCTIONS TO ITS CREDIT.

WE ARE AT THE PRESENT MOMENT AT WORK ON CONTRACTS TO THE VALUE OF OVER ONE MILLION POUNDS FOR CLIENTS WHO HAVE ENGAGED US BEFORE AS THEIR REINFORCED CONCRETE ENGINEERS.

THE TRUSSED CONCRETE STEEL CO. LTD.
22 Cranley Gardens, South Kensington, S.W.7

Tenders Accepted

ACTON.—The tender of Messrs. Leslie & Co., Ltd., £50,263, has been accepted for the erection of a technical institute at Acton for the Middlesex C.C., from plans prepared by Mr. H. G. Crothall, F.R.I.B.A., County Architect.

BIRMINGHAM.—The Corporation have accepted the following tenders: Mr. J. Goodman, for the erection of stables and sheds, Belcher's Lane, Hobmoor Lane; Messrs. R. Fenwick, Ltd., for the erection of an infant welfare centre at Charlotte Road, Stirchley; Messrs. W. Edwards, contractors (Birmingham), Ltd., for the erection of 86 non-parlour houses at Spring Road, Tyseley; Messrs. H. Boot & Sons (London), Ltd., for the erection of 164 small non-parlour houses at Gospel Lane, Acock's Green. The E.C. have accepted the tender of Messrs. J. E. Harper & Son, Ltd., for the erection of a pavilion, etc., at Henbury's Playing Field, and also their tender for alterations and additions at the College Road Council School. The Corporation Gas Committee have accepted the tender of Mr. T. Johnson for the erection of stores and offices at Windsor Street Gasworks.

BLACK HEATH.—For the erection of 80 houses on the Stile House Farm estate, for the Rowley Regis U.D.C. Messrs. J. Harper & Sons, Black Heath, £31,073 (accepted).

CHELMSFORD.—For the erection of 12 cottages at Writtle for the R.D.C. Mr. A. Holmes, Chelmsford, £4,603.

CHESTERFIELD.—The tender of Messrs. James Laver & Sons, Ltd., of Sheffield, for the erection of 50 houses for the Chesterfield Corporation at £18,930, has been accepted.

COVENTRY.—For a new Sunday School in connection with Radford Congregational Church the tender of Messrs. Jarvis Bros., Stoke Park, Coventry, amounting to £3,198 14s., has been accepted.

FOLESHILL.—For the erection of a chapel at St. Paul's Cemetery, Foleshill, the tender of Messrs. E. Harris & Son, amounting to £2,499 18s. 11d., has been accepted.

FLEETWOOD.—New buildings are to be erected for the British Legion Club, Fleetwood. The architect is Mr. Alan Lomax, A.R.I.B.A., of Fleetwood, and Platt Bridge, Wigan. The contract has been placed with Mr. James Salhouse, contractor, Milton Street, Fleetwood.

HALESOWEN.—For the erection of a new Council school at Hill and Cakemore, for the Worcestershire E.C. Mr. William Jackson, Langley Green, near Birmingham, £16,935.

WOMBWELL.—For the erection of 66 type A houses on a site situated near King's Road. Architect, Mr. D. H. Roberts, L.R.I.B.A., Park Street, Wombwell, near Barnsley, Yorks. The contract has been placed with Messrs. Oakland Bros., Ltd., of Barnsley, at £375 per house.

Trade Notes

The illustrations of the National Physical Laboratory, Teddington, published in our last issue, did not include the Photometry Building. Our attention has been called to the unusual construction of this building, where the walls are entirely composed of Kinnear Patent Steel Rolling Shutter manufactured by Messrs. Arthur I. Gibson & Co., Ltd., Radnor Works, Twickenham. This firm also supplies to the High Voltage Laboratory for an opening 35 ft. high by 35 ft. wide two Kinnear Shutters with an intermediate double guide, enabling an opening half the width, on either side, to be used, or to its full extent without obstructions or projections.

The exodus of the big manufacturing firms from the centre of London continues. Messrs. Doulton & Co. Ltd., the famous pottery firm, have transferred their London stoneware pipe department from Lambeth to Erith. The firm has, of course, other works in the provinces, but this transfer marks another stage in the gradual but inevitable disappearance of the Lambeth colony of potteries, of which Doulton's factories alone remain. The new works at Erith, which will use the stoneware clays from the firm's clayfields at Poole, have a riverside jetty, railway sidings, and are equipped with the latest and most improved labour-saving plant.

The fire protection services for the coming Bath and West and Southern Counties Agricultural Show will be in the hands of Messrs. Merryweather & Sons, Ltd., Fire Engineers, Greenwich Road, London, S.E.10, who are providing a fire station at Stand No. 3 which will be fitted with the most modern fire-fighting appliances.

Personal Note

Mr. E. A. Verger, L.R.I.B.A., has been appointed County Architect for the East Sussex County Council at a salary of £800-£1,000 per annum. His appointment dates from October next.

Is it Economy

to save on the outer covering of your buildings?

English Hand-made Facing Bricks and Roofing Tiles are the only materials which will give full service and improve with age.

Save upkeep costs and avoid rapid depreciation by selecting your building materials in the showrooms of

50 TONS OF WATER

Roof of Mr. J. LEALE'S
factory at Guernsey, hold-
ing 50 tons of water,
waterproofed with
VULCANITE.

on a VULCANITE ROOF!

No need to fear rain dripping through a roof covered with a material that will stand that strain !

Vulcanite Roofing is absolutely water-tight and weatherproof. It is Fire Resisting, too, when covered with sand and gravel or $\frac{1}{2}$ inch of tar macadam. Low in first cost, its long life makes it not only the best but the most economical roofing on the market.

Roofs covered with Vulcanite are safe for years. This is why Vulcanite has been used during the past 30 years by Architects who want the best and who study their clients' expenditure as well as their own reputation.

VULCANITE FLAT ROOFING

Complies with the London Building Act and Building Bye-Laws of all Borough and Urban District Councils requiring an incombustible exterior roof covering, and is accepted by all the leading Fire Insurance Companies as a full Tariff Roof.

WIN THE FIGHT AGAINST DAMP BY USING VULCANITE DAMPCOURSES

Easily Laid—will not squeeze out, fracture or rot.
We make a variety of Dampcourses for all types
of Building.

May we send you our Catalogue? Detailed drawings and estimates willingly submitted.

VULCANITE FLAT ROOFING
is supplied and fixed only by

Vulcanite

IRONS, Etc.

"M.K."
Switchplugs

INTERLOCKING and FOOLPROOF. THE IDEAL CON-
TROL FOR ELECTRICAL DOMESTIC APPLIANCES

Manufactured by

"M.K." ELECTRIC, LTD., Wakefield Street, Edmonton, N.18
Telephone - - - - - Tottenham 3056 (3 lines).

Predominating Features:—

FULL 5 AMP. CAPACITY
INTERLOCKING & FOOLPROOF
UNTARNISHABLE FINISH
HORIZONTAL MOUNTING

THIS latest "M.K." innovation is an entire departure from all previous designs. The small projection, combined with the pleasing and artistic appearance of the cover and base, make an instant appeal to the most discriminating tastes. Both the electrical and mechanical features of the inter-locking and fool-proof switch action are fundamentally sound, and have been subject to the most stringent tests.

We shall be pleased to have your request for further particulars, or a sample to inspect and test as you wish.

CURRENT MEASURED RATES.

[COPYRIGHT.]

These Prices apply to a New Building, costing from £1,000 upwards, in the London Area
They hold 10 per cent. in excess of the actual prime cost, without Establishment Charges.

and glass are as one, and the bravest window dressing takes on a sad and discouraged look, which advertises nothing except a failure to realise that a bright and cheerful setting is half the battle in display.

Anyone who sets out to try and classify the various types of London shop-front design will soon become aware that there are almost as many categories as there are trades. He will realise with sorrow, if he is an architect, that not all firms which have to deal with building are housed with the taste and seamliness which so well becomes those who have the inestimable joy of commerce with the architectural profession, but he will also be consoled by some notable exceptions. He will note with pleasure that tradition has not been killed by the requirements of modern shop fitting, and that the small panes and bow fronts of our ancestors have their prototype to-day, opposing a note of refinement and gentility to the opulent display of unrelieved plate-glass.

For those who take pleasure in the old-fashioned shop, what could be more satisfying than a glimpse of Fribourg & Treyer in the Haymarket (Fig. 1), with its flush panelled doors surmounted by fanlights whose detail is thick with paint, whose ancient iron handrail to the steps from the pavement is as nearly perished as may be? This shop has all sorts of charms, from a most ingenious goods entrance, contrived under the right-hand bow, to curved brown shutters which on Sundays circle the bays and give the

whole establishment an air of gentlemanly retirement. It is a delightful design, offering every opportunity for the tempting display of small-scale wares.

This is the starting-point, the old work which is so difficult to surpass. But somewhat in the same vein is the well-mannered front of Hatchard's in Piccadilly (Fig. 2), with polygonal bays, a front of brown stained oak, and pleasant gilded lettering on a tilt fascia. The doorways are well managed; there is a centre one for the shop, with a goods hoist in a recess to the left—closed in the daytime by a little grill gate—and to the right is an entrance to offices above. In the side of each of these lateral recesses is a sheltered topped niche, with opposite to it a return of the display window. Altogether a satisfactory and appropriate design, but the columns, with their entasis and Ionic caps, are perhaps a shade less distinguished than the rest.

In Berners Street the Carron Company (Fig. 3) does justice to the excellence of their wares in a design of restraint and good proportion, and take advantage of wide areas to afford a glimpse into basement showrooms—a skilful arrangement. The design is appropriate to the display of big articles, in the same way as the windows of Osler & Faraday's *Lanthorn House* in Newman Street (Fig. 4) are in a suitable scale to show their electrical fittings. The windows with their deep glazing bars are nicely handled, but they spring rather suddenly from their stone openings. The narrow

in vermillion enamelled bronze below each window gives a welcome note of colour.

At opposite poles from these examples, in every way, is the smart and very French design of Paris-Trades in Berkeley Street (Fig. 5). Of white marble, with steps, skirting and soffit of blue glass mosaic, this little shop lends a gallant note of gaiety to its neighbourhood. It is, of course, a little harsh; but with its etched glass panels and tiny windows showing delicate and fanciful feminine knick-knacks, it is a cheering sight and sends one off in a good humour. From the practical standpoint, the recessed front is an indispensable accompaniment to the small show windows which demand a close inspection.

A rival in gaiety to Paris-Trades is Atkinsons in Bond Street (Fig. 6), with its heraldic colouring and green windows, behind the glass of which hang draperies of fawn. This shop front, in spite of its English inspiration, is Parisian in effect; probably it is because its design is both courageous and competent. The Bond Street side is the most effective, for in Burlington Gardens the façade is a shade mechanical in repetition.

Interesting in quite another way is Crittall's shop front in High Holborn (Fig. 7), of white relieved with touches of bronze and orange, blue, and gold. The pattern of the glazing is well considered, and there are several little touches in design which must be seen to be appreciated. The effect is discreet, but yet it is pleasantly gay. If the surround could have been in some richer material than that employed, the scheme would have gained in an appearance of dignity and permanence.

Norway House in Cockspur Street (Fig. 8) has always been a design of character and strength, although, if memory serves, it once rejoiced in gilded metalwork which set off the sombre tones of its granite base. At present the vigorous modelling of the masonry and the great lamps which overhang the pavement are the chief points of dramatic interest in a scheme which has throughout a pleasantly theatrical quality. The planes of the masonry are cleverly handled, and though the effect is a little grim, the

whole design is worthy of the St. Olaf who now fills the niche which in our photograph is vacant.

The former Cunard offices, also in Cockspur Street (Fig. 9), with their green marble pilasters, were a first-rate example of what may be achieved by simple means and the art of good proportions, a less ambitious scheme with similar basic qualities being the design for the shop front to the offices of *Public Opinion* (Fig. 10), a very excellent example of taste and skill.

To conclude this group of shop fronts, we have selected an example (Fig. 11), which, strictly speaking, is not in this category at all, but it partakes so strongly of shop-front attributes that our apologies for illustrating it are only half-hearted; in addition to which it is a clean and competent design, holding its own in a street which has the nicest shops of all London.

Royal Richmond

Most people, we imagine, have regarded Richmond as a Thames-side town that was reasonably immune from the destructive influences of motor transport. Walled round by its Great Park, Deer Park, Green and the river, it is a jealously guarded beauty spot, whose narrow approaches discourage through traffic. With its magnificent Terrace view, one imagined that Richmond was a spot where the visitor would wish to linger, and would find sufficient recompense for his stay in the superb natural surroundings. The beauty of Richmond, however, is likely to prove its undoing. It has so long been a Mecca for a day or half a day that an ever-increasing stream of 'buses, char-a-bancs, and private cars now wend their way towards it, and the resulting congestion of the narrow streets is doubtless responsible for proposals that would destroy the very amenities that attract people to the place. It is, no doubt, an effective way to cure traffic congestion by destroying or removing the root cause, even if you raze every beauty spot in the country in so doing. But, with due deference to the traffic authorities, we think they are all wrong. The fact that people are attracted to a beauty spot is no sufficient reason for cutting speed roads through it.

NEW NEEDS AND MODERN NOTIONS—VII

By EDWIN GUNN, A.R.I.B.A.

This article commences a further series of contributions by Mr. Edwin Gunn, in continuation of those which appeared in our issues of January 7 to February 11.

Anyone able to cast back their memories twenty-five years or so, and to pass in review common practice then and now in the minor details and fittings of the ordinary small house, must be at the same time greatly encouraged and somewhat disappointed at the changes which have taken place. Many items,

such as the replacement of the old-style kitchen range by less voracious fuel-eaters, have been reviewed in previous articles of this series, and it is now proposed to survey some of the lesser components of the house and estimate the sources and nature of their change and the trend of further metamorphosis.

WHITEWASHED EXTERIORS.—The everyday house of twenty-five years ago had a "front" of red bricks which incontinently turned the corner and died—becoming the common brick of the district—yellow stock, grey stock, or local wirecut often much pleasanter in effect than the supposedly better facing. Now, all over the south-east and in many places further afield, the fletton brick or one of a like nature reigns supreme. The fletton has qualities which render its adoption inevitable—cost and regularity not the least important—but few will claim that it is beautiful. Hence the spread of roughcast, pebble dash, rough-rendering, and whitewash. Of roughcast there is little to be said except that over-roughness spoils scale, and that roughcast chimneys are rarely a success. They scale, and are a source of mess and roof damage if re-whitening is ever undertaken. Of pebble-dash I would like to say things which could never be printed. The gravel-beach effect applied to house walls is the dingiest finish ever devised. Rough-rendering can be made quite pleasant if the plasterer can be induced to be natural and not believe that he is expected to get either a smooth finish without the appropriate tools or, on the other hand, to exaggerate the roughness by clawing and scraping the surface. But it is in the application of whitewash to the greasy fletton that the blindness and optimism of the race is most apparent. Whitewash undoubtedly covers a multitude of sins, and I, for one, would like power to tour the country with a gang of authorised whitewashers with intent to place a healing wash over any gruesome colour-affront which might be benefited thereby. But the naked fletton does not either retain the whitewash for long or show to advantage even while it does so, owing to its harsh regularity. Modern materials, however, furnish resources which allow of success. If external fletton brickwork be built in weak cement mortar—say 5 to 1—with joints filled flush but unpointed, and in cleaning-down be given a brush coat with a slush mixture of super-cement, this will be found to adhere well—to waterproof the face, to soften the harshness, and to provide a base upon which whitewash or distemper will remain.

AIR BRICKS.—From one reason or another, many more bedrooms are now built without a fireplace and its attendant chimney than was formerly the case, and for this reason come within the scope of the by-law requiring other means of ventilation to be pro-

vided. The resulting air brick is often difficult to introduce without unsightliness, and, moreover, it frequently results in a raging draught and so gets pasted over with paper inside or otherwise blocked, and if the situation is exposed, rain is also blown through. I have made it a practice

for some time past to contrive these ventilating openings as shown in Fig. 12, fitting a boxing between the feet of a pair of rafters and getting air through a perforated zinc grid in the eaves soffit. This is practically unnoticeable outside gives less draught, and no risk of rain-penetration is not liable to harbour birds, and generally works well. Where tile-hanging is used it is the only device fitting the case. The modern small house is apt to occupy a more open and exposed position than its Victorian forerunner, which was prone to huddle in rows. For this reason it is also worth while to specify a type of air brick which excludes driven rain—not only when it can be seen, but in those cases of under-floor ventilation when it can only be guessed at. A patent type of clay air brick known as Carter's obtainable for 1s. 6d. in 9-in. x 3-in. size, or 2s. 10d. in 9-in. x 6-in., is provided with a rain baffle in the form of an effective drip to the upper edge of each aperture, with a steeply weathered bottom to the entire perforation.

From air bricks to ventilation generally is an easy step. Domestic air supply has been more or less a matter of chance until quite recent times. The chimney as an outlet, and badly fitting windows, doors and floor joints did, in fact, suffice to maintain a fairly brisk circulation without special means. Now, however, that "fires" may be electric or gas, and standard metal casements may fit so closely as to admit little accidental air, while grooved and tongued flooring excludes chance supplies from that source, a controlled supply is becoming essential. The two expedients with which metal casement makers have familiarised us—the two-point cockspur and the transome light ventilator—satisfy the need, and similar contrivances can be fitted in connection with wood casements, but more consideration should usually be given to bedroom windows facing south (as good bedroom windows do), so that they may be left open without rain blowing in. A three-light casement in which the outer lights are handed and the middle are hung to push out, the whole covered by a close eaves of at least 12-in. projection, as in Fig. 13, will permit one or other of the lights to remain open to a reasonable extent to suit whatever wind happens to be blowing without admitting more direct current or driving wet than with other forms of window.

Dover Promenade Pier, from which the ever-memorable Zeebrugge expedition was embarked, is to be demolished, the structure having been condemned as dangerous. The Dover Harbour Board are asking for tenders for the purchase and removal of the pier, pavilion and buildings attached, the purchasers being required to leave the bed of the foreshore entirely clear.

NEW MOTOR SHOWROOMS, GREAT PORTLAND STREET.

THE ST. ALDATE'S SITE, OXFORD

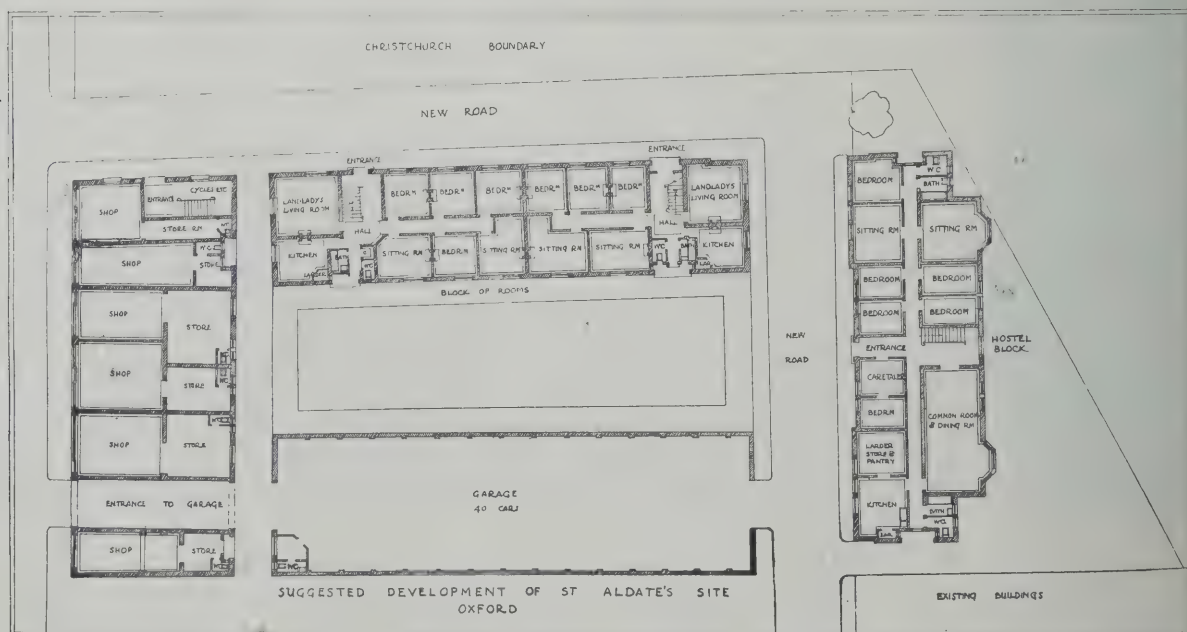

It is now over a year since the future of the vacant site on St. Aldates, adjoining Christ Church, Oxford, became a matter of controversy in the Town Council and in the daily press. Those who followed the matter at that time will remember that the demolition of some stables and outbuildings belonging to the College, in connection with the scheme for widening St. Aldates, disclosed to the public view the southern part of Christ Church, which is a very fine example of Tudor architecture. That revelation gave rise to a hope that the open space left by the removal of these buildings would be preserved. Between the Christ Church boundary and Folly Bridge there is a large area of slum property, adjacent to St. Aldates, which it is also proposed to clear; but up to the present only the piece mentioned, in area about 4 acres, is vacant, and it is about this site that the City Council is still debating and disputing.

Chiefly, Oxford is suffering from want of a decided policy in regard to the lines upon which its future growth is to be governed. In recent years there has been a tendency towards industrial development in and around the city, and if this continues and is encouraged, the results upon what has hitherto been, almost exclusively, an educational and residential centre, are bound to be far-reaching. Necessarily, if Oxford is to continue wholly or largely as a University city, the question of its amenities and quietude must be given priority and preference over considerations that would attain considerable wealth in dealing with

a manufacturing area. One has the impression that the civic circle is divided upon the alternatives of a commercial or an educational city, and is trying vainly to reconcile the conflicting claims of both.

The difficulty arises largely from the character of Oxford itself. In other, and newer, university cities the same problem would, probably, never arise. But Oxford is an old city which has developed slowly and in the old-world manner. The accumulated architectural wealth, from which its distinction and importance are mainly derived, demands the utmost care and reverential treatment. The tacking on to this ancient nucleus of new schemes of widened streets and commercial buildings presents all the danger attendant on patching old garments or pouring new wine into old bottles.

Some wise philosopher once emphasised the outstanding importance of "attitude of mind" in dealing with human affairs. And it is the attitude of mind of the Civic Council towards their city which seems in need of determination. If they regard it as a priceless heritage, the beauty and amenities of which must be preserved at all costs, then one may guarantee that these will be preserved. If their attitude of mind is less fixed or determination wavers under the lure of increased rateable values, the results may be very different and, probably, very regrettable. Too many local governing bodies, alas, now rue the day when in seeking to exploit the natural or architectural advantage of their charge, they really started to

SUGGESTED DEVELOPMENT FOR ST. ALDATE'S SITE, OXFORD.
THOMAS RAYSON AND A. TRYSTAN EDWARDS, A.A.R.I.B.A., Architects.

SUGGESTED DEVELOPMENT FOR ST. ALDATE'S, OXFORD: ELEVATION TOWARDS CHRISTCHURCH.
THOMAS RAYSON AND A. TRYSTAN EDWARDS, A.A.R.I.B.A., Architects.

demolish the basis of its attraction and prosperity.

At present, the St. Aldates site is valued in the civic account books at £20,000, and the City Council has agreed that no building shall be erected upon it within 20 feet of the Christ Church boundary. The College authorities, on their part, have agreed not to build upon the area adjoining the site unless it is considered necessary to put a screen between the College and any buildings which the Municipal authorities permit to be erected on the vacant site. This is not an unreasonable precautionary proviso; and, in point of fact, the College is setting an example in thus foregoing the considerable pecuniary advantage that would accrue from developing their valuable street frontage on St. Aldates.

If the whole site between Christ Church Meadows and St. Aldates were cleared and left as an open space, a magnificent approach to Oxford would be provided from the south. Such a scheme has been very warmly supported in many quarters; but the Council does not appear to be in the least likely to consent to the loss of revenue which such a project would entail. By others, the present widening of St. Aldates to a breadth of 50 feet is deemed insufficient, and the City Council is urged "to sweep away all buildings on the east side of this thoroughfare, leaving, in emulation of Princes Street, Edinburgh, nothing but a splendid vision of park and meadow and great trees by the river." This is a grandiose scheme; in itself not unattractive if the attendant economic difficulties could be overcome. We are by no means certain, however, that Oxford would be improved, or its character unimpaired, by development

on lines which have proved particularly suitable in the "Athens of the North." One must take account of the traffic problem; but beauty spots are places to be visited, not traversed, and already in some of them traffic facilities have been increased to a point which has "improved" their particular attractions off the face of the earth.

Both these schemes, involving the clearing of a considerable area beyond that now available, remain more or less in the air. A more recent proposal would devote some part of the vacant site to garage accommodation or parking ground, which is much needed in Oxford, the remainder being laid out as an open space in a manner that, as far as possible, might mask the utilitarian use of the other portion. Another scheme would bar the site from commercial "exploitation," and limit its use to the erection of buildings of a public or semi-public character. This projected form of development is believed to have stimulated an application to use the site for the erection of a synagogue. It is questionable, however, whether a synagogue, a block of municipal offices, an expensively designed theatre, concert hall or cinema would form a more agreeable architectural neighbour to Christ Church than a group of "commercial" buildings if of the right character.

And as even an educational and residential centre demands the provision of a shopping centre, which St. Aldates might reasonably provide, the question of a suitable commercial "exploitation" is not, it seems to us, one to be ignored or ruled out. It would, for instance, meet the views of those members of the City Council who consider that their duty to the rate-

SUGGESTED DEVELOPMENT FOR ST. ALDATE'S SITE, OXFORD: ELEVATION TO ST. ALDATE'S.
THOMAS RAYSON AND A. TRYSTAN EDWARDS, A.A.R.I.B.A. Architects.

payers demands some solution that will bring in an adequate return on the capital that has already been sunk; and it by no means rules out an architectural treatment that would be in consonance and sympathy with the venerable buildings in its immediate vicinity. The most practical policy, then, would appear to be the retention of the type of shop existing on the St. Aldates frontage, an increase in the actual number of shopping premises, while, at the same time, improving the façades and adding an appropriate number of office rooms or residential flats above the ground floor.

An interesting design for the utilisation of the site on these lines has been prepared by Mr. Thomas Rayson and Mr. A. Trystan Edwards, of which we give some illustrations. Concerning their scheme, the architects have furnished the following particulars:

"The frontage on St. Aldates is occupied by a row of small shops with a hostel for undergraduates above, while room is found on the site for two more blocks containing undergraduate quarters, and also a large public garage. Care has been taken to avoid giving any of the buildings a pronounced symmetry or an institutional character such as would cause them to compete with Christ Church. The façade towards St. Aldates, though urban in style, is yet informal, and that towards the College is intended to be as unobtrusive as possible. It is suggested that eventually the same style of shop front should be continued as far as Folly Bridge, while the area behind the shops could be devoted to houses, or flats with common gardens.

"As there is now a great shortage of undergraduates' rooms, it was thought desirable that the area at present cleared should be devoted mainly to supplying additional accommodation of this nature. The plans, however, are so prepared that, if necessary, with the minimum of structural alteration the hostels or lodging-houses could be turned into flats. So far the City Council has arrived at no decision with regard to the disposal of the site, but it is understood that any proposals for its development, from whatever quarter they come, are welcome."

Oxford is a city of world renown, and the problem of the St. Aldates' site is of far more than local interest. It is, therefore, a matter of real public interest and concern that the solution should not be lightly or hastily arrived at, and that the merits of various schemes for utilising the site should be carefully considered and weighed before any of them is finally adopted.

Edwin Austin Abbey Memorial Scholarships. Particulars, Secretary, Edwin Austin Abbey Memorial Scholarships, Chelsea Lodge, 42 Tite Street, S.W.3.

Closing Date, July 1.

Cemetery Chapel, Reading. Limited to architects residing or practising in Berks, Bucks or Oxon. Premiums, 50 and 25 guineas. Assessor, Mr. Charles J. Blomfield, F.R.I.B.A. Particulars, Borough Surveyor, Town Hall, Reading. Deposit £2 2s.

Building News in Parliament

WESTMINSTER, Wednesday, June 8.

Immediately before Parliament rose for a short Whitsuntide recess, Lord Eustace Percy, President of the Board of Education, made an announcement as to the Board's policy with regard to the planning and construction of school buildings. A Committee has been appointed with the following terms of reference: "To inquire and report as to the construction of school buildings, with special reference to (1) the use of new materials and method of construction, and (2) the reduction of cost." The following are the members of the Committee: Sir Frank Baines, Director of Works, Office of Works; Mr. G. Topham Forrest, architect to the London County Council; Mr. G. F. N. Clay, architect to the Board of Education; with Mr. A. F. Birch-Jones as secretary.

In reply to questions which were put to him by Mr. Henry Cowan, Lord Percy said seventy schools have been closed or replaced, and in 126 others defects have been removed. In addition, plans have already been approved for the replacement or reconstruction of 321 other schools. He pointed out that the rate at which schools can be replaced depends upon the local circumstances in the different areas. In many cases the problem is affected by movements of population consequent upon housing developments, and it is important that replacement should be undertaken generally with a considered scheme of reorganisation. Generally speaking, the programmes of local authorities show that the bulk of the provided schools will be dealt with by 1930.

The Minister of Health has been questioned again from the Labour Benches with regard to the proceedings of the Committee on the Prices of Building Materials. He stated that the last meetings of the main Committee were held on March 3 and June 2. Mr. Thurtle immediately inquired whether the Committee, if it is to exercise effective control over prices of building material, should not meet much more frequently. Mr. Chamberlain replied that it did not follow, from the infrequency of its meetings, that the Committee had been idle. A great amount of negotiation and discussion, he said, have been going on apart from meetings.

Another question which was raised on the eve of the adjournment concerned the appointment of Sir Herbert Baker, A.R.A., as the architect for the new India House in London. Mr. Stamford asked whether the selection of the architect had followed an open competition, and whether the Government of India had considered preliminary plans or suggestions from any other architects. Earl Winterton, the Under Secretary for India, who replied, stated that there had been no competition in connection with this appointment. He gave no further information beyond the statement that the architect was appointed by the High Commissioner of India, with the approval of the Government of India.

Arrangements have been made by the Select Committee who are considering the Architects' Registration Bill to resume their sittings shortly after the House of Commons reassembles on Monday, the 13th instant.

New Ways and Means

The Editor will welcome early information of
New Plant, Materials and Fittings

The "Bull Dog" Floor Clip: Showing Clip as supplied and in position in the Concrete Slab.
(The Adamite Co., Ltd.).

A Device for laying Wood Floors over Concrete

A patent metal clip for use in fixing wood floors upon a concrete foundation has just been introduced from America by Messrs. The Adamite Co., Ltd., of Regent House, Regent Street, London, W.1. As shown by the accompanying illustrations, this clip is so designed that it can be pushed into the concrete whilst the latter is still in a plastic condition, and that it then serves as a means for anchoring the strips or battens to which the flooring is subsequently nailed. In practice, the work of placing the clips can proceed within 30 minutes after pouring and levelling off the concrete slab, a guide board being used to give accurate spacing and alignment to the clips, which are embedded so that their flat tops become flush with the surface of the concrete, where they offer no obstruction to the use of the floor after the concrete slab has hardened. When the job is ready for the wood floors to be laid, the tabs of each clip are raised by the aid of a chisel or the claw of a hammer, so that they stand perpendicular to the surface of the concrete ready to receive the

The "Bull Dog" Floor Clip: Nailing Strips in position ready for laying the Floor.
(The Adamite Co., Ltd.).

nailing strips. The latter are now placed along each row of clips, levelled up with wedges where necessary, and securely nailed to the tabs of each clip. Any hollow spots beneath the strips can then be "slushed in" with thin cement mortar to give a solid bearing along the entire length of each strip, and without further delay the flooring can be laid down and nailed in position. These "Bull Dog" Floor Clips can be supplied in three sizes—2 in., 3 in. and 4 in.—and are made in one piece from heavy-gauge sheet metal which is galvanised to resist corrosion from the damp concrete. The ends of each clip are pointed to make it an easy matter to push them into the concrete, whilst side-lugs are provided to reinforce the anchorage. Using the 2-in. clip, which will be found suitable for all general requirements, a spacing at 16 in. on centres in both directions should be specified, the nailing strips being dressed to 1 1/8 in. x 1 1/8 in. from 2 in. x 2 in. material.

The "Bull Dog" Floor Clip: Showing Method of Placing Clips and Raising Tabs.
(The Adamite Co., Ltd.).

An Improved Electric Light Fitting

A cord grip lampholder possessing several new features has recently been added to the "Magnet" series of electric lighting accessories manufactured by Messrs. The General Electric Co., Ltd. This lampholder, which is made in moulded "bakelite," embodies a cord grip which is distinctly novel, in that the usual wooden split ferrule is replaced by a ball-and-socket arrangement which relieves all possible strain, and at the same time permits the use of a variety of types and sizes of flex. The terminals are also of an improved pattern, which are easily wired, whilst the shade-carrier ring is provided with two small lugs to facilitate the fixing and removal of shades with narrow necks. As "bakelite" is a non-corrodible material, it is interesting to note that the screw threads on this ring cannot "bind" under the influence of those conditions which prevail in bathrooms, kitchens and sculleries.

The "Woodlock" Casement Stay.
(Matchett & Martineau, Ltd.).

A Casement Stay which eliminates Rattling.

A combined casement stay and fastener, designed to eliminate "rattling" whilst automatically securing itself at any angle to which the casement is pushed open, has just been placed on the market by Messrs. Matchett & Martineau, Ltd., of 260 Bradford Street, Birmingham. In its action this "Woodlock" Stay relies upon the friction created between a pair of discs, or washers, made of lignum vitæ, which are housed in the elbow at which the two arms of the stay are pivoted. These washers are claimed to give 50 to 60 years' service before becoming ineffective under the wear and tear involved in opening and closing the window, and whilst resisting ordinary wind pressure, they are said to yield under the impact of a gale, so that the casement will close gently when it has been left unattended. In addition to this, the arms of the stay provide for a simple but positive locking device, giving protection to the casement when it is closed, as indicated in one of our illustrations. This fitting is equally suitable for right or left-hand openings, and is applicable to French windows and garage doors, as well as to wood or metal casements. At present it can be supplied in three sizes, for light, medium or heavy duty, a variety of finishes, such as porcelain enamel, oxidised copper, nickel and brass, being available.

The "Woodlock" Casement Stay.

MESSRS. McKIM, MEAD & WHITE, Architects.

THE AMERICAN BUSINESS MAN'S HOTEL—II

By HOWARD ROBERTSON, F.R.I.B.A., S.A.D.G.

The passenger elevators, of which there are twelve, are grouped in one block, for ease of control and supervision. There is a "starter" who is in charge of the elevator service, and who indicates which are express elevators and which are not. Some of the elevators are express to the tenth floor and stop at any floor beyond, while one elevator is occasionally express to the roof restaurant. In addition to these elevators, there is a further block of two which serve for communication with the Pennsylvania Railroad, which is connected directly with the hotel by subway, and there are also two elevators which serve the banquet and ballroom group, which is on a third mezzanine above the ground floor.

There are five floors, or mezzanines, tucked in between the ground floor and the first guest floor plan, a portion of which is given over to the men's and women's Turkish baths (Fig. 2).

These baths are grouped round a central plunger, pleasantly lit by a glass ceiling (Fig. 3). The architectural effect is very good with a white enamel finish, terrazzo laid upon the floors and lining the pool, and tiled arcing in blue and white ceramic. The water to the pool is cleansed by a double sand filter, and the installation of the baths includes every item of modern equipment, including sun-ray electric cabinets.

From the point of view of examining the detailed planning of the hotel, the simplest method is to consider the four main heads into which hotel requirements seem naturally to divide themselves, these being as follows: The public floors, comprising lobbies,

dining-rooms, etc.; public rooms for functions, comprising ballrooms and banqueting rooms; service portions, comprising kitchens, laundries, and mechanical departments of all kinds, including accommodation for employees; typical guest-room floors, comprising bed and sitting-room accommodation.

To these four main headings may be added a fifth, that of the sample-room accommodation which is provided in some American hotels, such as the Statler at St. Louis. The sample-room provides bed-sitting accommodation, by means of disappearing fold-back beds, extra wide door-openings to provide for ingress of large trunks and sample cases, and special lighting for the effective display of goods.

With the typical lobby and vestibule accommodation of the large hotel we have already partially dealt, that of the Pennsylvania being fairly typical. An excellent example of ingenious and effective planning is that of the Statler Hotel in Detroit, one of the most successful of the Statler chain. Here full advantage has been taken of the site in the main plan grouping.

The lobby, as a rule, is two storeys in height, surrounded by a mezzanine some 12 ft. or 13 ft. above the main floor; this has the advantage of allowing reasonable height for shops and ground-floor public rooms generally.

Apart from the usual ground-floor lounge-room there are, of course, the restaurants, the area of which depends on local requirements, as also the nature of the service given. In the Pennsylvania Hotel there

Fig. 2.—THE PENNSYLVANIA HOTEL, NEW YORK: DETAIL OF THE TURKISH BATHS FOR MEN AND WOMEN ON THE FIRST GUEST FLOOR.

MESSRS. McKIM, MEAD & WHITE, Architects.

re six restaurants of different type and price, ranging from a tea-room to the roof garden situated on the topmost guest floor, a beautiful room, which, of course, commands a magnificent view, and the decorative scheme for which is typical of hotel work of this class (Fig. 1).

In many hotels a cafeteria, or popular-priced lunch-room, is provided, and, apart from these facilities, every hotel has the banquet room, which accommodates any number upwards of 200 or 300 guests. It has been calculated that an hotel of 500 rooms would require space for 700 to 800 diners, which, allowing 2 ft. to 13 ft. per person, gives an area of some 10,000 super feet (exclusive, of course, of banqueting rooms).

Public lounge-rooms in American hotels are generally designed in period styles, and the work is often carried out by decorating firms. Italian or Spanish tradition is found in nine cases out of ten as the keynote for the lounge and halls, some phase of English mediæval architecture denotes the library or writing-room, and French or Adams is drawn upon for dining and ball-rooms. Occasionally there is found some decoration of the modern school, but it is mostly a recent depart-

ture, as, for example, the painted rooms which Jacques Carlu, a French Prix de Rome in architecture, is carrying out in the new Ritz-Carlton Hotel in Boston.

As regards the detail planning of ballroom and banqueting suites, there are no special requirements to note beyond independence of access and working and convenience in service. It is worth while mentioning, however, the importance of providing driveway or lift access for delivery trucks to the ballroom, for there is a growing tendency to use the ballroom for exhibition space, and it is essential that exhibits may be readily handled.

In many ways it is the service section of hotel planning which provides the most interesting study, the question of adequate provision for services becoming much more complicated as the size of the hotel increases.

Service access is, of course, nearly always provided on the less important frontage, and as far as possible from the public entrance. In some cases, as in the Pennsylvania Hotel, there is a through driveway flanked by ample unloading and storage space, so that all congestion of pavements is avoided; in any case, it is arranged that luggage (which in America is often

Fig. 3.—PENNSYLVANIA HOTEL, NEW YORK: THE PLUNGE IN THE MEN'S TURKISH BATH.
MESSRS. MCKIM, MEAD & WHITE, Architects.

“checked” from place to place, and arrives by van), stores, ashes, etc., shall be handled at some one point where control of employees may be concentrated.

A point of hotel policy is the question of sleeping-in accommodation. There is a tendency, governed, of course, by local conditions, to reduce the number of employees sleeping-in, and some hotels even decline to feed employees. As a rule, accommodation is provided for female help, as in the Drake Hotel in Chicago, which accommodates 135 maids and pantry girls in so-called “Pullman” bedrooms, and at the Pennsylvania, where 150 maids and housekeepers are provided for on two floors.

The service bedrooms are usually situated on a combined service and dormitory floor acting as a buffer floor between the guest-room floors and the downstairs public rooms. In the space of this floor are run the trunk lines of the ventilation ducts, the plumbing, vacuum cleaning, wiring, etc.; all the services which if run under the ceiling of the public rooms would be an eyesore. Situated, however, below the ceiling of this service floor, there is every facility for repair and upkeep, and the provision of a sort of duct or service mezzanine floor has become practice even in office buildings, *e.g.*, the new Barclay-Vesey Telephone Building in New York.

The next most burning question is that of kitchen location, and on this point practice varies. If the main kitchen is on the same floor as the principal dining-room, generally the ground floor, valuable rental space is sacrificed, but service to the restaurant is splendid in operation. It is a point for the management to consider whether rental outweighs the advantages of efficient service, and in most of the Statler hotels (*vide* Fig. 6) the principle of planning on the same level is insisted upon.

As a general rule, it is the aim of the designer to plan in such a way that all food is prepared in bulk in the main kitchens, and only warmed and served in the secondary kitchens, while a series of floor pantries are arranged to give room service to the bedrooms. In the Pennsylvania Hotel there is a main room-

service pantry to every three floors, from which trolley dumb waiters are loaded and wheeled to bed and sitting-rooms for breakfasts and other meals.

The ratio of kitchen area to dining-rooms is a variable factor, but it is always large, and it is figured that as much as $1\frac{1}{2}$ square feet of kitchen for 1 square foot of dining area is not an unreasonable proportion.

The planning of the kitchens is a study by itself. In the Hotel Drake is a kitchen (Fig. 4) planned below the dining-rooms (Fig. 5), but, on the other hand, the layout is considered to be a model of its kind on a particularly generous scale. The combined area of dining-rooms and kitchens in the Drake Hotel give a figure of 100 square feet per room (the Drake has 763 rooms), but in smaller hotels it has been calculated that this proportion goes as low as 25 ft.

The type of range used varies in different establishments, gas and coal, or both, being often employed while oil is also a favourite in certain sections of the country where crude oil is cheap. Electric ranges are also frequent, but, of course, much depends on power facilities available. In the secondary kitchens gas ovens are usual, as, for instance, in the Pennsylvania Roof Garden Restaurant, which is largely served from the main kitchens in the basement by an express elevator.

It is interesting to note that in the Pennsylvania kitchens red quarries are used for flooring, but while they are satisfactory in wear, they also prove to be slippery. Sawdust has been employed as a palliative and it is also proposed to use a special wire net.

Daylight is considered desirable in the kitchens but there is little or no advantage in window ventilation, as forced ventilation is always installed, and open windows merely tend to short-circuit the ventilating system.

One of the difficult problems of kitchen planning is the disposal of garbage. Where sub-basement space is available a garbage chute leads to a pit adjacent to a garbage freezer, an arrangement which permits of retrieving lost silver, one of the trials of hotel management being the amount of good table

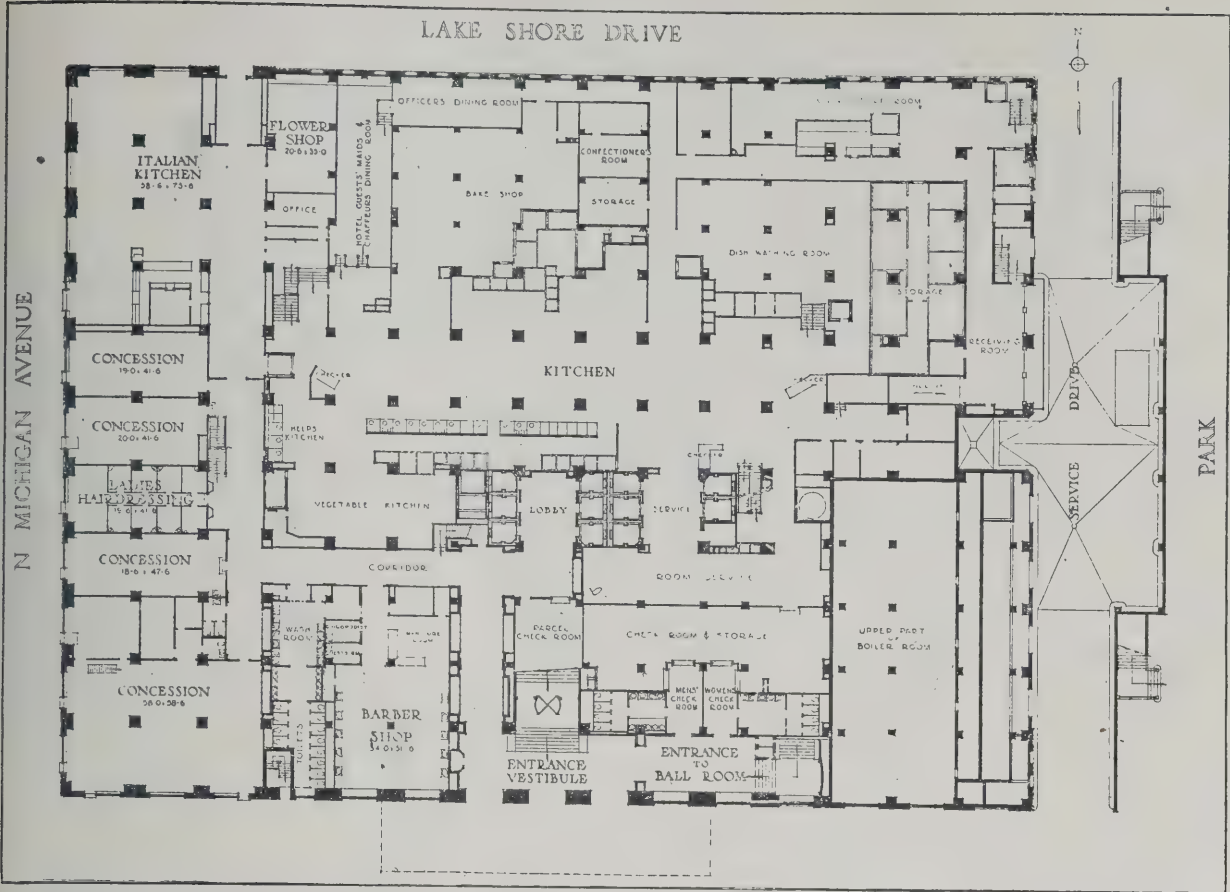

Fig. 4.—THE DRAKE HOTEL, CHICAGO: LOWER GROUND FLOOR, SHOWING KITCHEN AND SERVICE LAYOUT.

MESSRS. GEORGE B. POST & SONS, Architects.

ware which finds a mysterious way into the garbage pail. (Very often a small fee is regularly paid to employees for silver discovered, though the question of preventing collusion must present difficulties). The most common system of dealing with garbage is by gas incinerators or brick oven encased in firebrick, for the heat from burning grease, etc., is considerable.

Ice-making machines supplying 36 tons per day, an enormous laundry, and a vast mechanical plant for heating and ventilation are all services which occupy a large part of the basement of the Pennsylvania Hotel, but distributed through the various floors of a large hotel are various other indispensable services. In the Pennsylvania, for instance, there is a carpenter's shop on the twentieth floor, which takes care of all repairs to joinery, furniture, glazing, etc., and requires a staff of 50 men. All repairs to lift motors, etc., are also undertaken, while another activity is the making on the premises of all the keys used in the hotel, of which there are 50,000! There is also made a master key which opens every lock in the building.

The valet service in an American hotel is a very important item. It is at work with day and night shifts, for the American traveller expects to have his laundry and valeting carried out at a moment's notice.

It can be readily understood that a building which supplies its own service to the extent that is the case in these big hotels demands an enormous personnel. In the case of the Pennsylvania Hotel the number of

guests averages some 2,600, with a "peak" number of about 3,100, and the total hotel staff is about 2,300. In the Hotel Drake in Chicago, which is more of a "de luxe" establishment, there is a proportion of employees to guests of about one-and-a-quarter to one-and-a-half to one.

(The next and concluding article will deal with the planning of guest rooms and their equipment).

Coming Events

Institution of Heating and Ventilating Engineers.—On June 20-22 the summer meetings of the Institution will be held at Bournemouth. Headquarters will be the Hotel Burlington, Boscombe, Bournemouth.

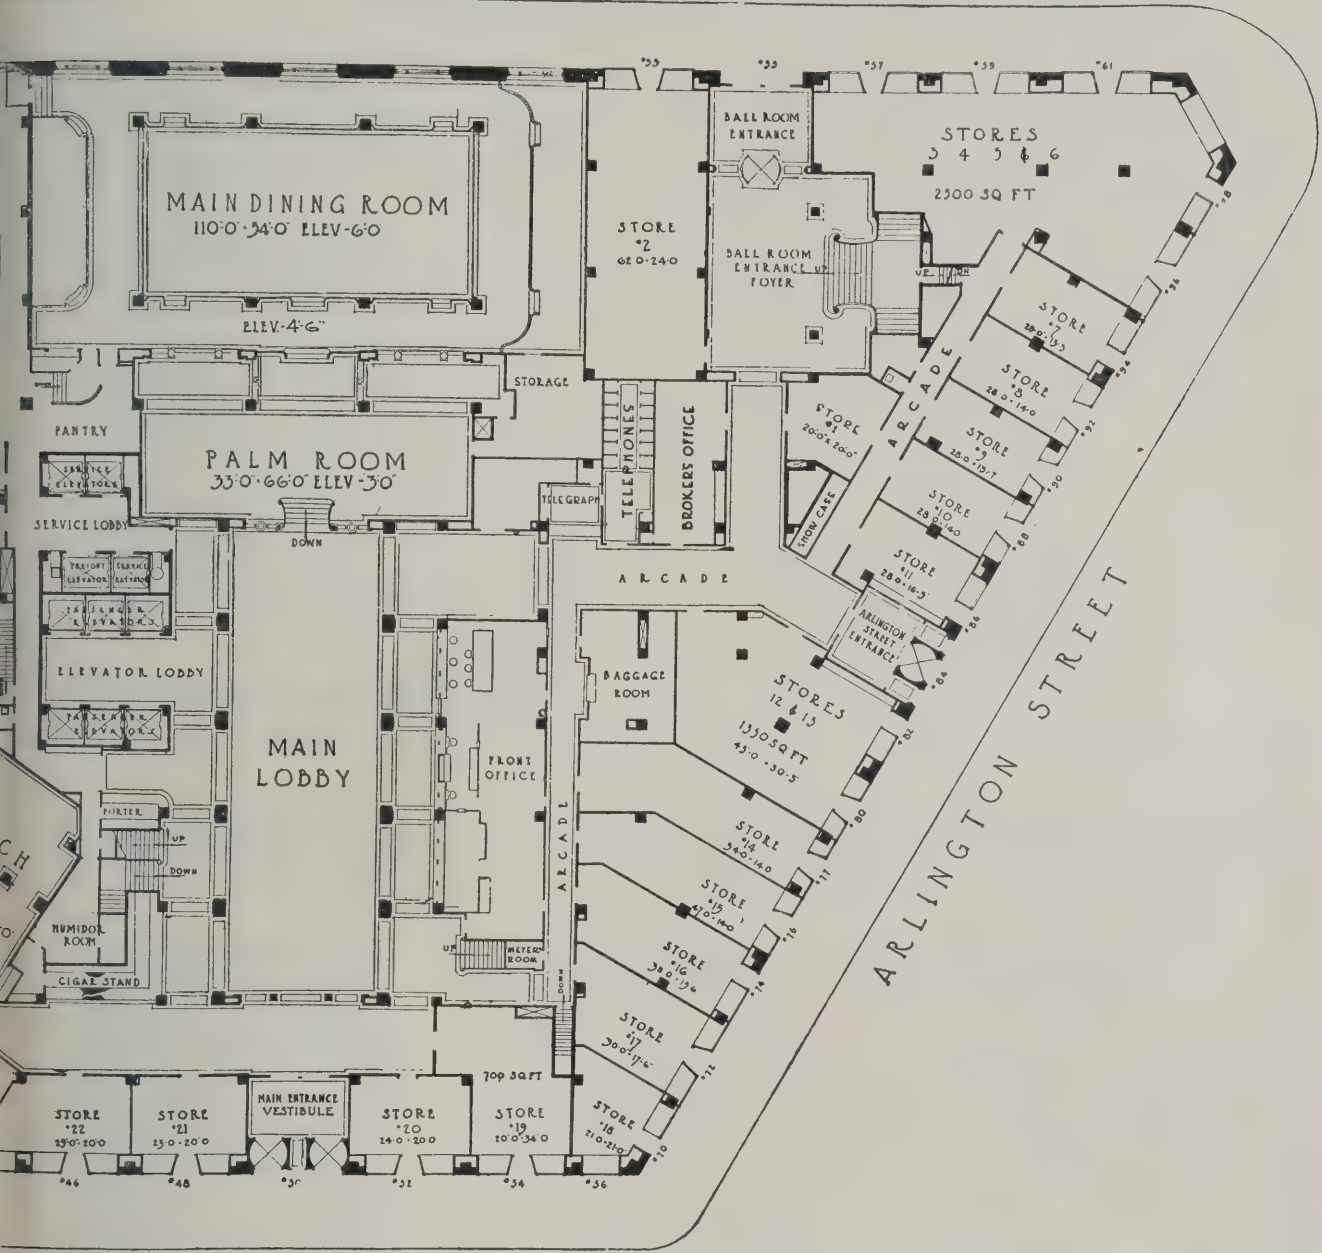

Institution of Municipal and County Engineers.—On July 2 a meeting of the Institution will be held in the N.W. District at Lytham St. Annes.

Institution of Municipal and County Engineers (West Midland District).—July 22.—Meeting at Warwick.

The Prefect of Angora, the Turkish capital, after a tour of municipal and town-planning study in Europe, has announced the appointment of a Committee of German, French and Austrian architects and town-planning experts to prepare a scheme for re-planning the town.

The Development of an Ideal — in Craftsmanship

Elizabethan Man-o'-War.

AMONG the periods in the history of the world, when creative effort reached the peaks of expression, must certainly be reckoned the Elizabethan age. This glorious epoch in the nation's history represents in creative ability a tremendous stride forward towards the higher Craftsmanship we know to-day.

* * *

The application of electricity to everyday requirements has taken only as many years in its stride as other industries have taken centuries.

For this reason all electrical research and experiment has been, and must continue to be, intensified in progressive effort to meet the needs of to-day and thus those of to-morrow.

"Craftsmen in Electrical Switches"

Perfection in Radiator design IDEAL CLASSIC

The combination of practical and artistic qualities in the Ideal Classic design renders it pre-eminently the radiator for every situation.

High Efficiency.
Rapid Heating.
One-third floor space saved.
No leaky joints.
Reliability and Neat Appearance.

Offices, Showrooms & Works : HULL, Yorks.

London Showrooms : 439 & 441 Oxford Street, W.1

London Building Notes

BARKING.—Extensive new shop and showroom premises are being erected upon a corner site in the High Street, for Messrs. Gosling & Co., by Mr. J. Clements, builder, Barking. The steelwork is being supplied by Messrs. Sanders & Forster, Thames Works, Barking. The plans have been prepared by Messrs. C. J. Dawson, Son & Allardyce, Clock House Chambers, Barking.

BATTERSEA.—Plans have been sanctioned for the reconstruction of the Picture House, at Wandsworth Road, S.W., owned by Messrs. Super-Shows, Ltd., showing a considerable enlargement of seating accommodation. The architects are Messrs. Petch & Fernand, 12 Buckingham Palace Road, Westminster, S.W.1.

CITY OF LONDON.—The Corporation have passed plans, submitted by Mr. A. Alban H. Scott on behalf of the "News of the World," Ltd., for the erection of a building upon the site of 23-30 Bouverie Street.

EAST HAM.—A large department store, three storeys in height, is to be erected upon a site in High Street North for the directors of the London Co-operative Society, Ltd., Maryland Road, N. The building work is in the hands of the Co-operative Wholesale Society, Ltd., Building Department, 99 Leman Street, E.1. The architect is Mr. L. G. Elkins, F.R.I.B.A., 99 Leman Street, E.1. Steelwork is being supplied by Messrs. Walter Scott, Ltd., Leeds.

FENCHURCH STREET.—A complete reconstruction of the large office premises at No. 16 Fenchurch Street is proposed. Plans for the new building have been approved, the architects being Messrs. Joseph, Pauls Bakehouse Court, Godliman Street, E.C.4.

FLEET STREET.—A large office building is to be erected upon the site of No. 54 Fleet Street, E.C.4, plans having been approved by the London County Council. The new building, which will include shops on the street level, has been designed by Messrs. Trehearne & Norman, Windsor House, Kingsway, W.C., and will be of five storeys.

FOREST GATE.—The Suburban Super Cinemas, Ltd., of Wardour Street, W.1, as owners of the Queen's Picture Theatre in Forest Gate, E.7, have in contemplation extensive alterations and additions—including a new balcony—to the building. The architect to the syndicate is Mr. Clifford Aish, 22 Bedford Street, W.C.

FORE STREET.—Large premises in Fore Street, E.C.2, have been acquired by the "Chilprufe" Company, Leicester, for their new London showrooms. Alterations and re-decorations will be effected by Messrs. Walter Lawrence & Co., Ltd., 19 Finsbury Square, E.C.2.

FULHAM.—Plans have been approved for Mr. G. R. Farrow, Amberley House, Norfolk Street, Strand, for the erection of garages on the site of Nos. 923-31 Fulham Road, next to Landridge Road.

GRACECHURCH STREET.—The old premises of the Colonial Bank, Ltd., are to be rebuilt upon the site of Nos. 28, 29, 30 and 31 Gracechurch Street,

E.C.3. The contractors are Messrs. B. Goodman, Ltd., 88 Haggerston Road, E.8.

HACKNEY.—The B.C. Housing Committee have prepared a scheme embracing the erection of five blocks of tenement dwellings, five storeys in height, on the plot of land on the south side of Southwold Road, giving accommodation for 100 families, at an estimated cost of £69,840, exclusive of the cost of land. The plans have been prepared by the Borough Engineer, Town Hall, Mare Street, Hackney.

HAMPSTEAD.—A large building, to be used as a junior school, is to be erected on a site in Holly Hill, Hampstead, N.W.10, for the Governors of the Frognal Collegiate School. The premises have been designed by Sir John Simpson, K.B.E., P.P.R.I.B.A., Verulam Buildings, Gray's Inn, W.C., and will be built by Messrs. Hall, Beddall & Co., Ltd., Waterloo Bridge, S.E.1.

HOUNDSBITCH.—Steelwork is being erected by Messrs. Powers & Deane-Ransome, Ltd., Cubitt Town Steel Works, E., for the new warehouses in Houndsditch for Messrs. Bevis, Marks & Co., Ltd., merchants. The new building—of 5 floors—is being erected by Messrs. F. & H. F. Higgs, Ltd., Station Works, Hinton Road, Herne Hill, S.E., to the designs of Messrs. Lewis, Solomon & Son, architects, Moorgate, E.C.2.

HOXTON.—The L.C.C. are to erect three additional blocks of tenements on the Ware Street area, Hoxton, at a cost of £29,560. It is proposed that the scheme shall be undertaken by Messrs. Rowley Bros., Ltd., who are now erecting other tenements on the estate for the Council.

KENSINGTON.—The L.C.C., the Kensington B.C., and Messrs. John Barker & Co., Ltd., are co-operating in a scheme for widening Kensington High Street, S.W., involving the rebuilding of the latter firm's large premises on a new frontage line, 30 ft. back. The scheme will take several years to carry out, the street widening alone costing £451,550. Plans for the new stores are being prepared by Mr. H. L. Cabuche, O.B.E., F.R.I.B.A., architect to Messrs. John Barker & Co., Ltd.

LONDON.—Sir Herbert Baker is now preparing plans for India House, which is to be erected in London at an estimated cost of £300,000.

LONDON.—The L.C.C. have accepted the tender of Messrs. Kinnear, Moodie & Co., 104 Victoria Street (£86,888) for work in connection with the new approaches to Lambeth Bridge.

LOTHBURY.—Extensive alterations are being carried out to the offices known as Nos. 3-4 Lothbury, E.C.2. The builders are Messrs. Trollope & Colls, Ltd., 5 Coleman Street, E.C.2.

LOWER MORTLAKE ROAD.—Extensive corner premises in Lower Mortlake Road, Barnes, S.W., have been acquired by the directors of the National Provincial Bank, Ltd., for conversion into new branch premises. Plans for the suggested alterations are in the

hands of Mr. F. C. R. Palmer, F.R.I.B.A., bank architect.

MARYLEBONE.—The governing body of the Regent Street Polytechnic, Marylebone, are to erect a building in Little Titchfield Street. Plans for the extension provide for a 9-storey building, including two basement floors, in which provision is made for the following departments: Carriage-building, tailoring, hairdressing, architecture and engineering (preliminary department), women's subjects, matriculation, commerce, school of music, and evening classes (general). Provision is also made for social activities, including a gymnasium, lecture hall and refreshment room. The new building is estimated to cost £170,500. The architect is Mr. F. J. Wills, F.R.I.B.A., 62 Oxford Street, W.1.

MINCING LANE.—A large site at the corner of Mincing Lane and Fenchurch Street, E.C.3, has been cleared prior to the erection of an office building, with shops on the ground floor. The contract, which provides for a Portland stone fronted building, is in the hands of Messrs. Trollope & Colls, Ltd., 5 Coleman Street, E.C.2. The plans have been prepared by Messrs. J. Campbell Jones, Son & Smithers, 9 Dowgate Hill, Cannon Street, E.C.4.

MORTLAKE.—Alterations and improvements are in progress to premises in Lower Richmond Road, S.W., prior to being taken over by the Midland Bank, Ltd., as branch premises. The builders are Messrs. Kirk & Kirk, 287 Upper Richmond Road, Putney, S.W.15. The architects to the bank are Messrs. Whinney, Son & Austen Hall, 8 Old Jewry, E.C.2.

ST. JOHN'S WOOD.—A large site in Wellington Road, N.W., adjacent to the St. John's Wood "Tube" Station, has been acquired by Messrs. H. F. Edwards & Co., automobile agents, 175 Great Portland Street, W.1, who propose to build extensive garage premises there. Their plans include accommodation for 150 cars and a petrol service station, wash-ups, etc.

ST. JOHN'S WOOD.—Messrs. H. W. Wills and W. Kaula, 22 Southampton Street, W.C., are to erect a block of flats in Park Road, St. John's Wood.

STRAWBERRY HILL.—Work is to be pushed forward in connection with the proposal of the Carpenters' Company to develop their large Strawberry Hill Estates. The area covers several acres, and plans include the erection of 130 houses and 40 tennis courts. The architect to the company is Sir Banister Fletcher, F.R.I.B.A., 1 King's Bench Walk, Temple, E.C.4.

WESTMINSTER.—Foundations are being placed for an extensive block of offices in Millbank, Horseferry Road, and Smith Square, S.W.1, which are to constitute the head offices of the new Imperial Chemical Industries, Ltd. The new building will contain 10 storeys, the site having an area of over 56,000 square feet. The contractors are Messrs. John Mowlem & Co., Ltd., Ebury Bridge Works, Westminster, S.W.1. Plans have been prepared by Sir Frank Baines, F.R.I.B.A., 34 Henrietta Street, Strand, W.C.2.

THE TILE WITH AN INTERNATIONAL REPUTATION

The Marseilles Tile is the outcome of many years' experience in Roofing Tile manufacture; it has made itself known in all the five continents by reason of its distinctive qualities—its low first cost, its appearance and its characteristic interlocking design. It is known

all over the world because of the economy it offers—economy combined with distinction. The Sole Importers and Distributors for the United Kingdom are LANGLEY LONDON LIMITED, of 161 BOROUGH HIGH STREET, LONDON, S.E.1.

MARSEILLES

ROOFING TILES

The Week's Building News

The following abbreviations are used: U.D.C. for Urban District Council; T.C. for Town Council; R.D.C. for Rural District Council; E.C. for Education Committee; B.G. for Board of Guardians; P.C. for Parish Council; B.C. for Borough Council; M.H. for Ministry of Health; M.T. for Ministry of Transport; C.B. for County Borough; B.E. for Board of Education. Direct confirmation should be obtained before commitments, for which we cannot be responsible, are made.

ADDESTONE.—The Chertsey U.D.C. is to proceed with the scheme for the erection of 50 houses at Green Lane and Prairie Road, Addlestone. Mr. Parker has been appointed as the architect.

BARROWFORD.—The "Sparrow Hawk Inn," Wheatley Lane Road, is to be reconstructed. The plans are by Mr. J. P. Earnshaw, architect and surveyor, of Nelson.

BINGLEY.—Plans for the erection of a new Parish Hall at Bingley have been prepared by Mr. Hugh Dale, architect.

BIRKENHEAD.—The Borough Engineer has prepared plans for the extension of the electricity offices in Craven Street at an estimated cost of £4,600, and tenders are to be invited for the work.

BIRMINGHAM.—St. Augustine's R.C. schools, which stand on a large site having frontages to Avenue Road and Uplands Road, Handsworth, Birmingham, are to be extended. Two new classrooms are to be added, and the cloak-room and lavatory accommodation will be enlarged. Mr. Victor Peel, of 17 Temple Street, Birmingham, is the architect.

BOLTON.—The Board of Education have approved plans of the E.C. for the erection of Lostock open-air school, and sanction the expenditure of £27,115 1s. 2d. for this purpose.

BROWNHILLS (STAFFS.).—Work is about to commence on the erection of the new Girls' High School, and on June 13 Lord Eustace Percy, President of the B.E., will lay the foundation stone. The cost of building the new school, a one-storey building, will be about £35,000. With the cost of the site and the reconstruction of Brownhills Hall, the total is about £43,000. The plans were prepared by the late Mr. S. B. Ashworth, F.R.I.B.A., who was architect to the Stoke-on-Trent E.C. The actual work is being supervised by the acting architect, Mr. W. H. Reynolds, A.M.I.Str.E.

CANNOCK.—The U.D.C. passed plans for 24 houses for Messrs. Webb & Whiteley at Pye Green Road. Plans were also approved for the Church of Our Lady of Lourdes, at Uxbridge Street, Hednesford, for the Rev. T. P. Healey. The architects for the new church, which is to cost about £30,000, are Messrs. Harrison & Cox, of Birmingham.

CHEADLE HEATH.—The Oil Well Engineering Co., Cheadle Heath, near Stockport, are proposing to erect a new canteen adjoining their works. The plans have been prepared by Mr. T. Heyes, architect, 106 Brompton Street, Oldham. The contract has been placed with Messrs. S. & J. Smethurst, Ltd., builders, Rochdale Road, Oldham.

COULSDON.—The U.D.C. Surveyor has prepared plans for 50 houses in Westleigh Avenue, and tenders for their erection are to be invited.

CROYDON.—A building scheme in

Croydon involves the erection of a large picture theatre in the High Street upon a site secured by Mr. I. Davis, of Oxford Street, W.1. The new building has been designed by Mr. Robert Cromie, F.R.I.B.A., 73 Edgware Road, Marylebone, W.2, to accommodate 3,500 persons, and will include extensive foyer and restaurant facilities. The cost is estimated at £200,000.

GATESHEAD.—The scheme to erect a new R.C. school at Gateshead is to proceed. The building will accommodate 840 scholars. The plans, prepared by Messrs. Stienlet & Maxwell, Saville Row, Newcastle-on-Tyne, have been approved by the B.E.

GODALMING.—The County Architect has been instructed to prepare sketch plans for a secondary school at Godalming, to accommodate from 400 to 500 scholars.

GRAYS.—The Essex County Architect (Mr. J. Stuart, F.R.I.B.A.) has been instructed to prepare plans for the proposed new school and hostel at Palmer's School, Grays.

GUILDFORD.—Plans have been prepared by Messrs. Clemence & Co. showing the lay-out of land at Stoughton for the governors of Trinity Hospital, Guildford.

HALESOWEN.—The U.D.C. have acquired Cornbow House for £1,500 for the purpose of conversion into municipal buildings, and the surveyor has been instructed to prepare a scheme for the reconstruction of the premises.

HALIFAX.—Messrs. Richard Horsfall, Son & Dawson, of Commercial Street, Halifax, have been appointed architects for the rebuilding of the Halifax Theatre Royal for the Northern Theatres Co., Ltd., Northcote House, Clare Road, Halifax.

HIGH WYCOMBE.—Plans for extensions at the High Wycombe Technical Institute have been prepared by the County Architect, the estimated cost of which is £7,500.

ILKESTON.—The borough engineer has prepared a scheme for the erection of 80 houses on the Rutlands Estate and for 76 on the Southern Estate.

KINGSTON.—Plans for the new Y.M.C.A. premises on a site in Eden Street, Kingston, have been prepared by Mr. John P. Blake, A.R.I.B.A., and provide for a lounge, billiard-room, games rooms, and other offices.

LEAMINGTON.—Foundation stones of a new Wesleyan Methodist Sunday school were laid last week. The site adjoins the church in Dale Street, and the building will cost £8,000. The architects are Messrs. Quick & Lee, 11 Waterloo Place, Leamington Spa, and the contractors are the executors of the late Mr. R. Bowen, 3 Tavistock Street, Leamington.

LEEDS.—The Corporation have passed the plan of Messrs. A. W. Hainsworth & Sons, Ltd., showing the erection of a building over Farsley Beck.

LEEDS.—Plans have been prepared by Kitson, Parish & Legard, F.F.R.I.B.A., for extensions to the Leeds General Infirmary, which are estimated to cost £253,000. The scheme consists of the erection of two blocks of three wards, which will provide accommodation for 300 additional beds.

LEICESTER.—Messrs. A. Brockelhurst & Co., of Palatine Buildings, Norfolk Street, Manchester, have been appointed architects for the new Wesleyan Methodist Church in Southfields Drive, Saffron Lane, Leicester.

LIVERPOOL.—The Corporation Land Steward and Surveyor has been instructed to prepare plans for a school to be erected on site No. 9 on the Norris Green estate.

LIVERPOOL.—The E.C. has appointed Messrs. Briggs & Thornely as architects for one of the schools to be erected on the Norris Green estate, site No. 13.

LIVERPOOL.—Plans for a new school in Corinthian Avenue, Old Swan, to accommodate 800 children, are under consideration, for which the Corporation Surveyor, Municipal Buildings, Dale Street, Liverpool, is the architect.

LIVERPOOL.—New schools and a parochial hall are to be built in Earle Road, Liverpool. The plans are being prepared by Messrs. Foden, Hemm & Williams, architects, of Century Buildings, 199 Deansgate, Manchester, and at Liverpool.

LIVERPOOL.—For the erection of a new church in Poulton Road, Seacombe, Wallasey. The contractors are Messrs. Brown & Backhouse, of 56 Chatham Street, Liverpool, and plans were prepared by Mr. Edmund Ware, F.S.I., M.A.Struct.E., of 43 Imperial Buildings, Exchange Street East, Liverpool.

LLANELLYD.—Mr. Howard Jones (County Architect of Merioneth) has prepared plans for a new school at Llanelltyd.

MORECAMBE.—Mr. Baines, of Morecambe, is the architect for the new Congregational Church in Sefton Road.

NEWCASTLE.—It is proposed to rebuild the Christ Church day schools, Newcastle. The scheme is estimated to cost £14,000. Mr. C. S. Errington, 21 Grainger Street West, Newcastle, is the architect.

NEWSTEAD.—Notts E.C. are to improve the Council School at Newstead at a cost of £2,330, and erect a new school adjoining at a cost of £8,000. The architect is Mr. L. Maggs, F.R.I.B.A., Shire Hall, Nottingham.

OXFORD.—Mr. Herbert Read, F.R.I.B.A., architect to Lincoln College, has prepared plans for considerable extensions, which are estimated to cost £43,000. The extensions are to be erected on the opposite side of Turl Street, and will be connected to the college by an ornamental bridge.

(Continued on page 1000)

THE TRUSCON FLOOR

Reinforced Concrete

Carrick Academy, Maybole, for the Ayrshire Education Authority.

Master of Works: William Reid.

Contractors: J. Inglis and Son.

THE LIVE LOAD ON A SCHOOL FLOOR IS USUALLY SMALL, THEREFORE THE DEAD WEIGHT OF THE FLOOR IS A VERY LARGE PERCENTAGE OF THE TOTAL LOAD TO BE CARRIED. THE TRUSCON FLOOR IS THE LIGHTEST FLOOR ON THE MARKET, AND ITS USE WILL EFFECT A CONSIDERABLE SAVING ON THE COST OF THE STRUCTURAL STEELWORK.

It is the primary duty of a floor to carry efficiently the loads which may come upon it. Of the other duties of a floor the least spectacular but the most useful is that of accommodating the "domestic services." The Truscon floor will do this.

Most buildings require gas and electric light, electric bells, telephones and water supply. Heating systems, either radiator or "panel," have to be allowed for, and sprinklers or ventilating systems are often required. The Truscon floor has an accessible hollow space in which all these services can be effectually concealed.

Tenders Accepted

ABERYSTWYTH.—For the erection of the large new hotel on the old Waterloo Hotel site at Aberystwyth. Messrs. F. D. Huntington, Ltd., of Broadway Chambers, Hamersmith Chambers, London, W.6, are the successful contractors. The scheme has been planned by Mr. Peter King, architect, of 121 Colmore Row, Birmingham. The hotel will cost about £80,000 to build, and, with furniture, the total outlay is estimated to reach about £100,000. It will contain 84 bedrooms, and there will be accommodation for 1,000 persons in a great café. The ballroom will be capable of accommodating about 300 couples.

BARNSELY.—Contracts for the erection of a new casualty and outpatients' department at the Beckett Hospital, Barnsley, have been placed as follows: J. Richardson, Barnsley, excavator, mason and bricklayer work; W. Goodyear & Sons, of 192 Sheffield Road, Barnsley, joiner's work; H. Wilson, Monk Bretton, near Barnsley, plasterer's work; A. Bray, of 66 Sheffield Road, Barnsley, plumber, etc.; Barnsley British Co-operative Society, Wellington Street, painter's work; Brown & Roberts, of Albert Street, Barnsley, electric work. The total cost of the extension is about £16,500, including equipment. Towards this between £13,000 and £14,000 has been contributed by the Barnsley Miners' Welfare Committee. Plans were prepared by Mr. C. F. Moxon, architect and surveyor, of Regent Chambers, 3 Regent Street South, Barnsley.

BEXHILL.—The Corporation Housing Committee have accepted the tender of Messrs. Nissen-Petren Houses, Ltd. (£15,949), for the erection of a further 36 houses on the Burnt House Farm Estate. The plans have been prepared by Mr. George Ball, A.M.I.C.E., borough engineer and surveyor, Bexhill-on-Sea.

BOLTON.—The Corporation have now accepted the tender of Messrs. William Borrow & Son for the erection of a refreshment-room at Leverhulme Park.

CHELTENHAM.—For the erection of a new lounge and waiting-rooms at the Daffodil Picture House, Suffolk Parade, Cheltenham. The contract has been placed with Messrs. A. C. Billings & Sons, Ltd., contractors, of 54 Winchcombe Street, Cheltenham; plans prepared by Messrs. L. W. Barnard & Partners, architects, of 14 Promenade, Cheltenham. The contract for the electric lighting, heating, etc., has been placed with Messrs. R. E. & C. Marshall, of Cheltenham.

COSELEY.—The U.D.C. have accepted the tender of Mr. A. M. Griffiths, of Wolverhampton, at £12,665, for the erection of 30 non-parlour houses.

DERBY.—For the Derby Hospital extension contract the successful firm is Messrs. Wildgoose & Sons, Matlock. The architects are Messrs. Naylor, Sale & Moore, Smith's Bank Chambers, Market Place, Derby.

DEWSBURY.—The contract has been settled for the erection of the new shop premises at Northgate, Dewsbury. The successful firm is Messrs. G. Moss

& Sons, Ltd., of Pennington Saw Mills, Leigh, Lancs. The plans for this scheme have been prepared by Messrs. North, Robin & Wilsdon, architects, of 35-39 Maddox Street, London, W.1.

FRASERBURGH.—The following tenders have been accepted by the Fraserburgh T.C. (subject to the approval of the Scottish Board of Health) for the erection of four blocks of houses: Mason, John Scott, Philorth, £2,337 12s.; joiner, Alexander Hall & Sons, Ltd., £1,699 10s.; plumber, John McNab, Frithsdale Street, £908.

FULHAM.—For the construction of the proposed new gatehouse and substation, with entrance gate, forecourt and electric sign, at the entrance of the electricity works, for the B.C. (architect, Mr. H. M. De Colleville), the tender of Mr. A. J. Thair, of Isleworth, at £1,936 11s. 3d., has been accepted.

GATESHEAD.—The contract for the rebuilding of the Blue Bell Hotel, Gateshead, has been placed with Messrs. J. Lunn & Son, St. Mary's Place, Newcastle-on-Tyne. The architects are Messrs. J. Oswald & Son, Worswick Street, Newcastle-on-Tyne.

GRANTHAM.—The Kesteven E.C. have accepted the tender of Messrs. Parks & Sons, Ltd., 5 Swinegate, Grantham, amounting to £9,550, for the erection of a new central school for boys. The architect is Mr. C. B. Metcalfe, F.R.I.B.A., County Architect, at the Education Offices, 64 London Road, Grantham.

HAWARDEN.—For the erection of 24 Class A, and 12 Class B houses, at Penyffordd, the Hawarden R.D.C. have accepted the tender, £14,160, of Messrs. Griffiths & Son, Rhyl.

HULL.—The Corporation Housing Committee have accepted the tender of Mr. F. Bolton, £3,680, for the erection of flats on the New George Street area.

LEEDS.—The contract has been placed in connection with the scheme of alterations to be carried out at the premises at 27 Station Road, Ossett, Yorks, for the Yorkshire Penny Bank, Ltd., of Leeds. The successful tenderers are Messrs. W. Nicholson, Ltd., of Sheaf Street, Leeds. The plans have been prepared by the bank's own architect's department at Leeds.

LEICESTER.—The tender of A. Graves & Son, £1,430, has been accepted for the erection of the northern light factory at North Evington, Leicester. The architect was Mr. R. Day, Leicester, and the quantity surveyors were Messrs. Robey E. Carter & Son, Palace Chambers, Leicester.

MIDDLETON.—The "Hopwood Arms" public-house at Slattocks, near Middleton, Lancs., is to be rebuilt. This contract has been placed with Messrs. T. Campion & Sons, contractors, Devonshire Street, Ardwick, Manchester. The plans were prepared by Messrs. W. Johnson & Sons, architects, 27 Oldham Road, Miles Platting, Manchester.

NEWCASTLE-ON-TYNE.—The scheme of extensions proposed to be carried out by Messrs. Swallow, Milburn & Co., Ltd., motor engineers and garage proprietors, of Barras Bridge, Newcastle. The tender of Mr. S. F. Davidson, 16 Ridley Villas, Newcastle-

on-Tyne, has been accepted. The plans were prepared by Messrs. Hedley & Dent, Frederick Street, Sunderland.

NOTTINGHAM.—The Building Sub-Committee of the Nottingham E.C. propose, with the City Council's sanction, to proceed with the erection of a new central school on the Bar Lane site for 800 senior pupils drawn from the city's elementary schools. The total cost will be £31,758, and tenders have been provisionally accepted as follows: Mr. J. F. Bush, builder and contractor, of 29 Radford Road, Nottingham, £13,804 (girls' block); Messrs. T. Long & Sons, builders, Falcon Street, Nottingham, £13,343 (boys' block).

OLDHAM.—Contracts have now been placed for the new Baptist Sunday school to be erected in Pitt Street East, Oldham. Following is a list of the successful tenderers: Brickwork—Mr. J. Hartley, Cobden Street, Chaderton; mason work—Mr. A. Mackey, Haringe Street, Oldham; joiners—Messrs. Samuel Ashton, Ltd., Plator Street, Oldham; slaters—Messrs. W. Henshall & Sons, Barket Street, Oldham; plumber—Mr. J. Harrison, Oldham Road, Royton; plasterer—Mr. J. Glynn, Station Street, Mumps, Oldham. The architects are Messrs. C. T. Taylor, Roberts & Bowman, of 10, Clegg Street, Oldham.

ONGAR.—The R.D.C. have accepted the following tenders for houses in their district as follows: High Lauer, eight, Messrs. W. A. Newburn & Co., Burnt Mill, £2,375; Abbess Roding, four, W. A. Newburn & Co., £1,216; Willingale Doe, four, Mr. H. G. Acres, Shelley, £1,300; Kelvedon Hatch, six, Mr. W. Connell, Brentwood, £2,118 3s.; Fyfield, six, Mr. G. H. Norrington, Writtle, £2,286; Toot Hill, four, Mr. H. G. Acres, £1,560.

TIVERTON.—For the erection of 50 concrete houses for the R.D.C. the tender of Messrs. Andrews & Miller, of Uffculme (£18,208) has been accepted. The architects are Messrs. Dixon & Barnsey, associated with Mr. Ellis, the Council's architect, St. Peter Street.

Royal Visit

H.R.H. THE PRINCE OF WALES TO VISIT THE OLD DELABOLE SLATE QUARRIES

An interesting hour will be spent by H.R.H. The Prince of Wales to-day, the 10th inst., when he visits and inspects the famous Old Delabole Slate Quarries, which are among the oldest in the Kingdom, having been in continuous working for nearly 400 years. H.R.H. is to go down into the huge pit and see the rockquarry, later visiting the saw houses where he will see the blocks cut, split and dressed into marketable slates. Much development and improvement has been made at these quarries during the last few years. New plant, including engines, motors and generators, has been installed, and petrol locos have replaced steam engines for top hauling. The production of slates has been considerably increased to meet the ever-growing demand for Old Delabole Slates, which are of great durability and have distinctive charm of colour.

"MURALINE"

THE PERFECT WATER PAINT

Sanitary, Artistic, Durable. Requires only the addition of water to make ready for use. In 40 shades. Sold in a dry powder.

Level with the floor- *not a little above or a little below*

A lift which stops above or below floor level is a likely source of mishaps. Absolute accuracy of stopping can now, however, be ensured by the S.M.S. "Truelevel" Control, which creates a new standard of lift stopping efficiency. This new control is the simplest and most effective gear yet designed for the purpose. It is also

the cheapest to instal. The accurate stopping at floor level is independent of skill of operator or weight of load. Further, with the "Truelevel" Gear, the brakes are dead silent, because the spring pressure can be reduced about 50% with the result that brakes cannot be heard when they come on. Any S.M.S. Electric Lift running on direct current can be easily fitted with this remarkable control. In certain cases, lifts of other makes can also be fitted.

We have prepared a fully descriptive catalogue which we will be pleased to send free on request.

Subway on the Underground, Charing Cross.

Underground Engineers chose Betonac

Railway Engineers set a very high standard for the materials they use.

For the floors of the new Charing Cross Subway the Engineers of the Underground Group chose Betonac Steel Concrete. In such a situation the requirements are exacting and Betonac fulfils them all.

Its hard, jointless surface is easily cleaned; it is practically dustless, waterproof, damp-proof and non-slip. Betonac withstands incessant traffic; it has durability comparable to that of steel.

Cementation Co., Ltd.,
Bentley Works, Doncaster

To withstand the pounding of lorries and the abrasions of millions of tyres, the cement used for making roads must have a high crushing resistance. This quality Kaye's Portland Cement possesses in an unusual degree. For the same reason it is unexcelled for ferro-concrete constructions.

H & C WROUGHT STEEL VENTILATORS

YEARS of experience in the manufacture of Ventilators made from Wrought Steel have resulted in many and important improvements being effected, chief of which is increased capacity for the free transmission of air.

We have reduced the area of fretwork obstruction and thereby largely increased the size of openings in our Ventilator faces, with added strength.

The air capacity of H. & C. faces will be supplied on request, together with sizes of Ventilators stocked. Made of heavy gauge steel to ensure rigidity and durability. Of all Ironmongers and Builders' Merchants.

BAD BUILDING

Mr. Guy Dawber has sounded in *The Times* the first note of a campaign, which "The Architecture Club" initiated a few weeks back, to explore the possibilities of securing better design in housing, particularly of a speculative character. His letter followed one from Sir William Forwood calling attention to the damage inflicted on the Lakeland scenery by the craze for erecting bungalows, many of such dwellings being in positions which entirely mar scenes of great and cherished natural beauty. Sir William's remedy is the imposition of some form of control on building, and in that the President of the R.I.B.A. supports him. Control would certainly be the shortest cut to the solution of the trouble, and Parliament has shown itself to be not unwilling to confer the necessary power. Unfortunately, as things stand, the only constituted bodies in whom Parliament can vest powers of control, are just those local authorities, composed of laymen, who, as Mr. Dawber points out, now pass plans for the kind of small houses whose erection we all deplore, and who are probably guided by the advice of a surveyor, "who may doubtless possess a sound knowledge of roadmaking and sewerage works, but in many cases is without the least æsthetic or architectural training." It is fairly obvious, therefore, that the measure of control which a local authority may obtain by adoption, under the latest Town Planning powers, will not necessarily, or even probably, improve matters; and that some more

drastic power of control, enforcing an appeal to skilled advice, will be needed to effect improvement. Control, too, if it is to be of any value, must be exercised. We have heard a good deal of the powers possessed by the City of Bath, the Stratford-on-Avon Corporation, and the local authority of Ruislip; also that Oxford, Edinburgh and other municipalities contemplate obtaining similar faculties. But all our information goes to show that these powers are not operating, that the authorised tribunals have not been appointed; and that, so far from being employed to stem the constant tide of bad or indifferent design, the veto is simply being held in reserve to checkmate building proposals which may, architecturally, be good or bad, but do not happen to coincide with the ideas of the authority concerned.

In the matter of remedies for the present evils, we must preserve a catholic mind. Effective control over design is one method to work for. Possibly another may be found in some movement of a constructive character which will engage the interest and co-operation of the builders who are at present afflicting the rural districts into which our great towns are spreading, and there are other steps that may be taken which need not be particularised here. The subject will, no doubt, be further ventilated at the forthcoming dinner of the Architecture Club early next month, and we may then learn some of the ideas that that body will endeavour to bring to fruition.

MODERN HOSPITALS

One only begins to appreciate the growing complexity of hospital design, and the ever-increasing amount of hospital "plant", which has to be housed in a suitable and easily accessible manner, when a hospital architect rises to report progress in this particular branch of architectural work, and produces a few plans to illustrate points in his address. At the R.I.B.A., last month, Mr. Lionel Pearson gave some results of his visits to the eastern states of the U.S.A., and to Holland, Denmark, and Sweden, to inspect examples of the latest hospital buildings, none being of earlier date than 1910. Necessarily, he had to generalise on distinctive features, for a too deep

excursion into details would have occupied the time of many Institute meetings. Briefly, it may be said that while the hospitals in the European countries mentioned follow pretty closely the lines of our own, the "uplift," which so largely dominates American aspirations and commercial buildings, also extends to the hospital premises. This is partly attributable to the fact that the bulk of the Eastern States population dwells in cities, and the hospitals, therefore, are city buildings, and partly to the fact that the extremes of temperature nullify to some extent the advantages of the pavilion system. The planning of hospitals, too, in many floors, simplifies the problem of heating, lighting and plumbing, and brings into

play all those items of equipment like lifts, linen shoots, etc., which are considered necessary in the interests of the staff. In fact, in America the comfort and efficiency of the staff are ranked as equal in importance to the welfare of the patient, and there is much to be said for this point of view. Another noticeable feature is the tendency to increase the number of private wards, of which the Henry Ford Hospital at Detroit is probably the most striking example. As we know from his latest book, Mr. Ford regards a hospital inmate as "a patient, not an exhibit." Every patient has a separate room, and the business of the nurses is to attend solely to their patients, the more menial duties usually allotted to a nursing staff being carried out by a special staff. But that a large proportion of patients desire private rooms was not the experience of the doctors present to hear Mr. Pearson's paper; and, as a system, it entails additional difficulties in supervision and staffing. Still, the large ward of 25 to 30 beds, in the lecturer's opinion, is now a thing of the past—the smaller unit of 12 beds seeming to be preferred. The provision of sanitation, often without

cross-ventilated lobbies, and, in the case of private wards, in lobbies opening out of the room, without ventilation to the outer air, are evidences of the American faith in their system of plumbing and mechanical ventilation which British architects hesitate to endorse; and the policy of burying pipes in the walls, while adding to the neatness and attractiveness of the sanitary accommodation, must occasion much trouble when anything goes wrong. The great increase in the number of X-ray departments in American hospitals is explained by the fact that more than 86 per cent. of the American hospital patients are subjected to this method of examination for diagnosis. It is a very striking development of hospital equipment over there. Other interesting points that emerged from the discussion following this interesting paper were the unpopularity of the circular ward, the decline in favour of the sanitary tower, and the modern preference for facing operating theatre walls with hard plaster, enamelled, in place of glazed tiling, the joints of which, as Sir Holburt Waring explained, are favourable to the lodgment of micro-organisms.

Notes and Comments

The British Architects' Conference

We may remind readers that the British Architects' Conference, which is being held in London, opens on Monday next, and those who are attending or proposing to attend it will confer a great obligation on much overworked officials by securing immediately all the tickets, etc., required for the various visits and functions in which they desire to participate. The afternoon of Tuesday next will be devoted to inspections of London buildings, four alternative tours being available. A fifth to the British Museum and the Foundling Hospital has been cancelled. There are, also, two alternative receptions in the evening. Two of the alternative visits proposed for Wednesday—a drive round Central London and a visit to Kensington—have been cancelled, but the visits to new London buildings and new London stores are available, with the garden party at Hampton Court in the afternoon and the exhibition of the R.I.B.A. Library treasures in the evening. The alternative excursions on Thursday stand, with the exception of that to Hatfield, Welwyn and St. Albans, which is cancelled; and there is no alteration in the arrangements for alternative trips on Friday and Saturday. Early application for tickets for the ball on Thursday night is specially desired. The Conference Banquet takes place at the Hotel Cecil on Friday night, when the Royal Gold Medal will be presented to Sir Herbert Baker, A.R.A.

The Erechtheum

The appeal of M. Philadelphus for the return to the Erechtheum of a caryatid and column, now in the British Museum, and said by him to have been "wrenched" from their position at the behest of Lord Elgin, has drawn some interesting letters to the columns of *The Times*. We referred to this matter in our leader last week, and the Bishop of Worcester rather confirms our view that exposure of these beautiful relics "to the no longer pellucid air" of the Acropolis would be neither for their welfare or the world's gain. The "wrenching" story has perturbed some of our noted antiquarians, but we would rather await some proof of this alleged vandalism by Lord Elgin, which has drawn such fiery denunciation from Dr. Farnell, the Rector of Exeter College. The Lord Elgin, of the "Marbles" fame, is not here to defend himself, and the expression of M. Philadelphus, who has not first-hand evidence, may be merely picturesque

hyperbole. On the other hand, a correspondent testifies to having seen a drawing of the Erechtheum, with substitute supports in position, the date of which is prior to the acquisition of the relics by Lord Elgin. It is more probable that the "wrenching," if any, was done by the Turks, who were then in possession, and readily aware of the appeal such things had for the travelling connoisseurs of other countries. We should hesitate to condemn the donor of these national treasures on the present unsupported allegation before us.

Gilbert's "Eros"

There has been a revival in the last few weeks of the controversy about the most fitting position for re-erecting Alfred Gilbert's famous fountain and surmounting figure, now temporarily removed from Piccadilly Circus during the execution of the Underground station alterations. Remembering the public outcry when Eros was taken down, only relaxed when official pledges were given that he would again be set up to dominate the whirl of London life, it is a little astonishing to find good people still suggesting various sequestered nooks to which he might be consigned, and eventually forgotten. It is to the credit of Londoners that they have an affection for Eros, which is bestowed on few of London's statues; and for that reason, if no other, it were well to put him back where the public liked, and were accustomed, to see him. But in all this spate of suggestions, no one seems to have thought of getting the distinguished sculptor's opinion. He is with us, and his views on the matter would be more authoritative than those of other people. Presumably, when the site was selected for this memorial to the 7th Earl of Shaftesbury, the sculptor was aware of the environment, and although traffic is now much greater, the Circus was even then one of the busiest spots in London. It is not an evil, as some appear to think, to have statues in busy thoroughfares; Paris has many amid much worse traffic. Our trouble is that we have so few fine ones. "Peter Pan," by Frampton, is the only other London statue for which its inhabitants appear to have a sincere regard, but Barrie's Elfin hero has such indissoluble ties with his sylvan surroundings that he would be misplaced elsewhere. We look to the redemption of official pledges to see Eros once again in his accustomed place. It was not unpleasing that the flower girls should wire their buttonholes under his wings.

THE MEMORIAL CHAPEL, CHARTERHOUSE SCHOOL.
SIR GILES GILBERT SCOTT, R.A., Architect.

THE MEMORIAL CHAPEL, CHARTERHOUSE

The new chapel of Charterhouse School, which is being opened by the King to-day, is one of the most original buildings Sir Giles Gilbert Scott has given us. It provides evidence of the continued vitality of the Gothic style, which it is likely we shall have with us in some form or another as long as the English race remains in possession of these islands.

THE JUSTIFICATION FOR GOTHIC

The truth is that the sum total of architectural achievement in this style is so great that to cease altogether to build in that manner would seem too complete a break with our national traditions. It must be said at once, however, that the reasons for continuing to design pointed arches are entirely of a sentimental character, for the constructional necessity to employ such features is no longer with us to-day. The pointed arch, it may be remembered, was the result of an attempt to provide the most economical solution of the problem of how to erect a fireproof building to the intersection of two aisles or an aisle and a transept of different widths at a time when the only material available was stone quarried in small pieces. It was found that while the junction of two barrel vaults of different widths provided a very awkward problem for the masons, it was comparatively easy to erect a vault over such an intersection, provided that a pointed arch was used, for the peculiarity of the pointed arch is that one can

have any number of such forms, all sharing the same height from impost to apex, and yet of various widths. The mediæval builders, having chosen the pointed arch for constructional reasons, soon found that the round-headed windows which for a time they continued to place on the external wall faces filling in the pointed framework of the vaults created a discord with the latter, and although there was not the slightest constructional justification for the windows being given pointed arches as well, it was yet found desirable on purely æsthetic grounds to make them conform to the pattern of the vaults. And not only the windows, but much of the wood-work; the screens and stalls inside the building were made to conform to the same convention, although, in this case, the material employed did not itself call for an arcuated treatment at all. Such was the origin of the Gothic arch, and the principal reason why it is employed to-day is either that the clients and patrons who employ architects are so much in love with mediæval traditions that they feel it incumbent upon them to have their buildings designed in the Gothic style whether or not this be economical or in accordance with the dominant ideas of the twentieth century; or else, recognising certain deficiencies in the style, they yet recommend its adoption on the ground that the new building is to take its place in juxtaposition to others belonging, perhaps, to the same institution as itself which have already set a fashion that it would be discourteous to ignore.

BUTTRESS AND BAY

It was, perhaps, this latter motive which influenced the Governors of Charterhouse School in their decision to have their Memorial Chapel designed in the Gothic style. In choosing Sir Giles Gilbert Scott as their architect, however, they made sure that the new building would be far removed in spirit and in form from those unintelligent transcripts of mediæval buildings which were erected in such large numbers during the latter half of the last century. The new Charterhouse Chapel is one of the most original buildings of modern times, and serves to show how an architect of genius can take an old stylistic medium and employ it for his own purposes in such a manner that it becomes a vehicle for the expression of a quite modern idea. A single glance at the exterior of this building is sufficient to make one realise how far we have travelled from the time-honoured forms of Gothic architecture. In fact, it is no exaggeration to say that unless the window openings had been crowned with pointed arches we should have been at a loss to determine any precise appellation for the style. Let us first glance at either the north or south elevation, which gives us the longest flank to the building. On looking at this elevation obliquely we see a general conformation of architectural features which reminds us of a row of the traditional Gothic buttresses. But a closer inspection of the façade reveals the fact that the narrow projections which divide the main wall surface into bays perform an æsthetic function exactly the opposite of that which the ordinary buttress serves. In mediæval church buildings it is the function of the main wall surface to provide window space, while the projections are solid and are obviously there to strengthen the structure and give it the anatomical equivalents of a backbone, the skeleton, in this instance, being shown externally in crustacean fashion. Sir Giles Gilbert Scott, however, with very great audacity, does just the opposite. His main wall surface is blank, whilst the narrow projections, so far from being emblems of solidity, themselves provide the framework for the only windows which are to be seen in this façade.

THE LANCET WINDOWS

The long single lancet windows also represent a departure from mediæval tradition, inasmuch as it is an entirely new treatment to have these windows isolated. The usual custom, of course, was for them to be grouped either in threes, as at the west end of the present building, or else in other patterns such as would prevent the total unit of fenestration seeming to resemble a tall and narrow slit of awkward proportions. It is noteworthy that the lancet window was originally the product of an age when glass was very expensive and not very easy to obtain, and when, moreover, the act of worship was associated with a certain artificial gloominess in the church building itself. It suggests, therefore, that the architect has perpetrated a piece of quite conscious archaism in thus reverting to a primitive form of window opening which the mediæval builders themselves gladly rejected as soon as they felt confidence in their capacity to glaze the larger areas of window aperture in which they took delight in the "Decorated" and "Perpendicular" periods. Provided, however, that these tall window slits, in conjunction with other openings, provide a sufficiency of light in the building, there appears no practical reason why they should not be employed. And it must be borne in mind that the new chapel at Charterhouse differs from the traditional type of Gothic church in that it has no aisles, and the main external walls are carried to a considerable height and are situated at no great distance from the centre of the building.

A REVOLUTIONARY TREATMENT

While, however, these tall lancet windows may be entirely justifiable from the utilitarian point of view, one may, perhaps, question whether they are, artistically, altogether satisfactory. In saying that these windows have an unusual proportion one is not, of course, condemning them, for what is unusual may still be beautiful. It is, perhaps, worth while to remember, however, that the art of architecture has been practised for many centuries, and that incomparable genius has been expended in the determination of its various forms. Window openings of an enormous variety have been invented to suit the different styles of architecture, and to conform to the practical requirements dictated by different climates and conditions of usage; but never before has there appeared in a building laying claim to artistic merit a window opening itself comprising a complete unit of fenestration which is of proportion of about twelve units in height to one unit in depth. Why not? one may ask. The answer to this question is not altogether easy to give. Yet it is quite clear that one is justified in subjecting these slits of windows to a candid criticism. The very fact that one can scarcely help calling them slits is, in a sense, their condemnation. The description indicates that the window openings have a certain quality which prevents them from possessing that unity and dignity which should characterise an important architectural feature. Now windows, which must ever be the principal symbols of the human usage of a building, are without exception the most important architectural feature in existence. There is no single element of building capable of expressing such a wealth of meaning as the window, and if the window has become a slit, has it not fallen upon evil days? For a slit has something in common with a crack, and a crack, although, of course, it may have a certain subsidiary unity of its own, chiefly appeals to us in its capacity of being a dividing member. It is something between two other things to which it is plainly subordinate. A slit also has this characteristic of being a dividing member; it has some of the attributes of a line which cuts across plain surfaces on either side of it, and as such one regards it as a thing of less importance as an object of contemplation than the larger units to which it is related. In the case of a Gothic façade of the traditional kind, such as King's College, Cambridge, for instance, one observes that the solid buttresses are here the dividing members, and they are clearly and rightly subordinate to the intervals between them, which are the bays containing the grand decorative windows—prime symbols, as has here been pointed out, of the human usage of the building.

The relative emphasis of the several features of the façade has there been expressed with the most perfect propriety. In King's College, Cambridge—a work which represents one of the topmost pinnacles of achievement in the art of architecture—we have genius superimposed upon common sense. In the new chapel at Charterhouse, however, the relative emphasis between window and wall surface is confused, and one might also say erroneous, for what do we find? The actual bays are blank walls, while the dividing members, which by all the laws of logic are subsidiary to the bays themselves, contain the supremely important architectural emblems, namely, the windows, which thus are relegated to a status of inferiority.

THE INTERIOR

The chapel is spanned at intervals by big transverse arches grouped in pairs, and is thus divided internally into alternate long and short bays. The longer bays have a pointed barrel vault executed in stucco, while the bays between the pairs of transverse

R.A., 1927.

NEW OFFICES AND FLATS, STRATTON STREET, LONDON, W.
W. CURTIS GREEN, A.R.A., Architect.

arches are groined, the big lancet windows occurring here, as it were, in cracks between the main constructional members of the building. Here again, we have a certain lack of straightforwardness, as if the architect were playing a trick with his windows, partly concealing them as if he were almost ashamed of their existence. Provided, however, that one obtains an oblique view of the long interior walls, so that the actual window openings on the flanks are invisible, the resultant impression is highly dignified. The effect apparently aimed at is one of imposing height, and in this Sir Giles Gilbert Scott has been completely successful. Both the west and east windows are worthy of special study, the former being marked by a triple lancet window enclosed in a heavily moulded pointed arch with small orioles under its apex, while the latter has a two-light window with thick mullion in between and a large oriole entirely filling the upper part of the window enclosure. In both these cases the circular forms appear to be inadequately related to the lancet windows below them, but there can be no question of the novelty and interest of the designs.

The general shape and bulk of the building is extremely impressive, and it certainly has the distinction of entirely overbearing the other school buildings. It remains for these latter, however, to undergo a renovation such as might enable them to be in keeping with the new structure. This latter will certainly be regarded as one of the most remarkable examples of twentieth-century Gothic. Sir Giles Gilbert Scott has here made some very bold experiments in design which will be a subject of dispute among architectural students for many years to come.

It is noteworthy that direct labour has been employed in the building, which has been in charge of the school clerk of works. Charterhouse has reason to be very proud of its new chapel.

Competitions Open

Closing Date, June 30.

Grammar School, Bradford, for 1,000 boys. Premiums, £300, £200 and £100. Assessor, Mr. Arnold Mitchell, F.R.I.B.A. Particulars, Mr. W. Brear, Secretary, Grammar School, Bradford, Yorks. Deposit £1 1s.

Closing Date, August 23.

University Buildings, Western Australia. To cost £150,000. Premiums, £400, £300 and £200. Assessors, Prof. Leslie Wilkinson, F.R.I.B.A., Mr. A. R. L. Wright, L.R.I.B.A., President Royal Institute of Architects of Western Australia. Particulars, Agent-General for Western Australia, 115-116, Strand, W.C.2.

Professional Societies

The Architecture Club

The following new members have been elected: Mr. Joseph Armitage, Mr. W. Aumonier, Mr. P. G. Benham, Mr. Alan Clutton-Brock, Mr. Philip Connard, Mr. John Gloag, Mr. Victor Gollancz, General Sir Aylmer Haldane, Mr. E. Stanley Hall, Mr. H. de C. Hastings, Mr. William Haywood, the Rev. J. L. Fisher, Mr. Basil Ionides, Mr. C. Pughe Morgan, Mr. Basil Oliver, Mr. D. Godolphin Osborne, Mr. W. J. Palmer Jones, Prince George of Russia, Mr. Michael Sadleir, Mr. L. Sylvester Sullivan, Mr. Arthur Towle, Mr. Laurence A. Turner, Sir E. Owen Williams, and Mr. Edmund Wimperis.

Mr. James Bone, after five years' service, has retired from the Executive Committee and becomes a member of the Council, also remaining Chairman of the Press Committee. The vacancy thus created has been filled

by the election of Mr. A. S. le Maitre. Mr. Nathaniel Lloyd, the other member of the Executive retiring under the rules, was re-elected at the annual general meeting.

The next dinner of the Club will take place at the Savoy Hotel on Tuesday, July 12, 1927.

A club visit has been arranged for Wednesday, June 29, at 2.30 p.m. to the Second Church of Christ, Scientist, Palace Gardens Terrace, Kensington, W.8 (Sir John Burnet, R.A., and Partners, architects), and at 4 p.m. to the Eleventh Church of Christ, Scientist, Nutford Place, Edgware Road, W.1 (Mr. Oswald P. Milne, architect).

Royal Society of Arts

ALBERT MEDAL

The Albert Medal of the Society for the current year has been awarded by the Council, with the approval of the President, H.R.H. the Duke of Connaught, to Sir Aston Webb, G.C.V.O., C.B., P.R.A., 1919-24 P.R.I.B.A., 1902-4 F.S.A., LL.D., "for distinguished services to architecture."

Amongst his works may be mentioned the new façade to Buckingham Palace and the architectural surroundings of the National Memorial to Queen Victoria; the Admiralty Arch, Charing Cross; the completion of the Victoria and Albert Museum; the Britannia Royal Naval College, Dartmouth; the Royal College of Science, Dublin; the Imperial College of Science and Technology, South Kensington; and many other public and private buildings.

Notes in Brief

The Centenary celebrations of Regent Street, London, organised by the Regent Street Association, are to open on June 23, and it is hoped that the occasion will be marked by the King and Queen driving through the street to constitute an official opening of the rebuilt thoroughfare.

* * *

The Queen laid the foundation-stone of the new chapel at Stowe School on Monday last. The building, which is being erected on a site selected by Sir Reginald Blomfield, R.A., has been designed by Sir Robert Lorimer, A.R.A., R.S.A., in the Classic style, and will be about 150 ft. long, 40 ft. high, and have a clear span in the nave of 37 ft. The organ will stand on a gallery over the entrance vestibule at the west end. About £15,000 towards the estimated cost of £40,000 has already been subscribed, and the headmaster has made an appeal for further funds.

* * *

The Lord Mayor of London, on June 8, laid the foundation-stone of a new wing to Queen Mary's Hospital for the East End at Stratford, the cost of which is estimated at £35,000, of which nearly half has yet to be raised.

* * *

The Prince of Wales, during his recent visit to Cornwall, inaugurated the new water supply for North Cornwall, which will supply the north Cornish coast area from Tintagel to Padstow. Capt. C. J. Jenkin was the engineer for the scheme.

Waterloo Bridge

The Parliamentary correspondent of *The Times* is responsible for a statement that the engineers, representing the Government, the L.C.C., and the Southern Railway Company, will not have finished their enquiry into the practicability of a double-decked bridge at Charing Cross for another six months, and until their report is received no decision as to the future of Waterloo Bridge is likely to be taken.

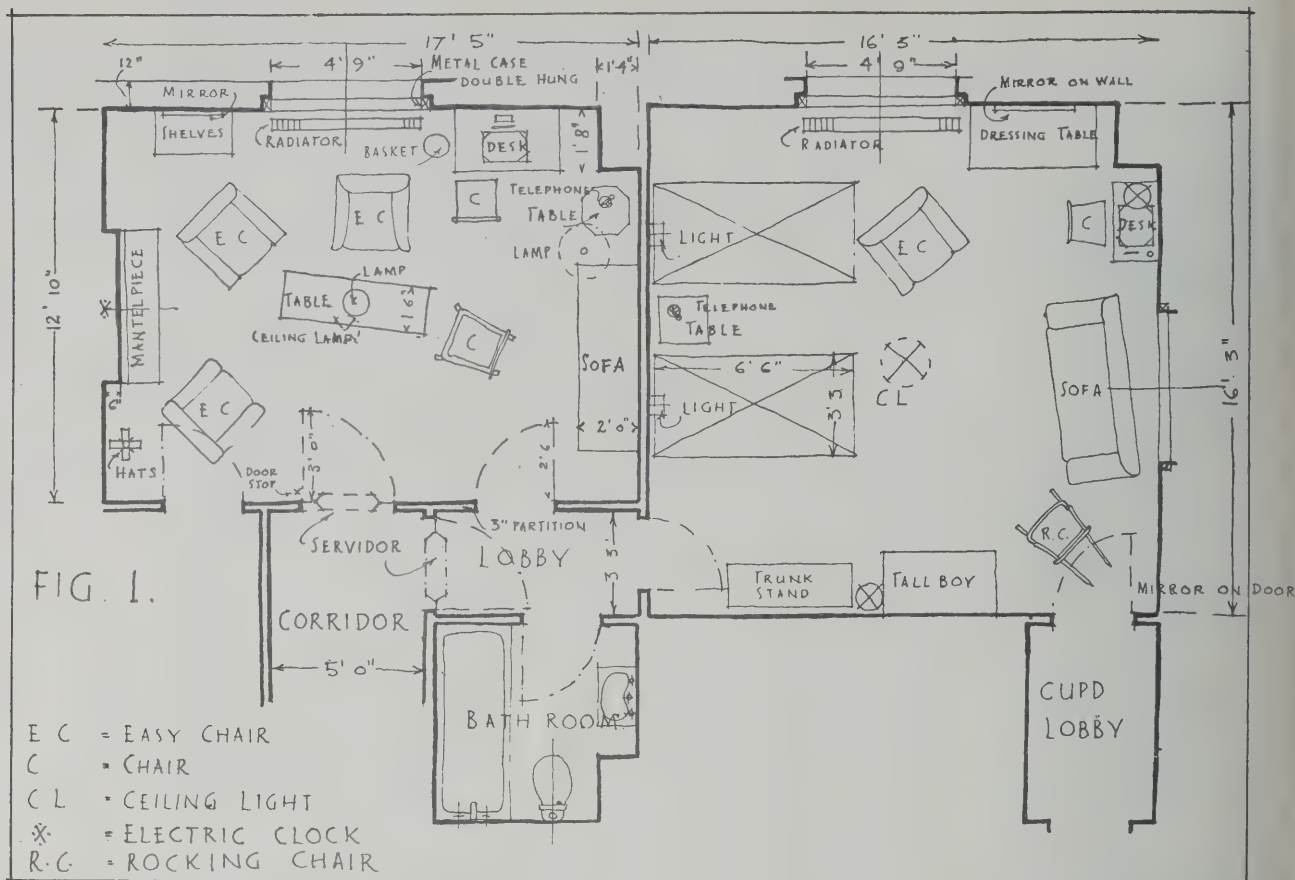

Fig. 1.—THE PENNSYLVANIA HOTEL, NEW YORK: A TYPICAL LAYOUT OF DOUBLE BEDROOM, SITTING-ROOM, LOBBY AND BATHROOM.

MESSRS. MCKIM, MEAD & WHITE, Architects.

THE AMERICAN BUSINESS MAN'S HOTEL—III

By HOWARD ROBERTSON, F.R.I.B.A., S.A.D.G.

(Concluded)

In considering the hotel plan, it is not, as might be imagined, the arrangement of the structural steel which should govern the general layout. Quite on the contrary, it is the bedroom and bathroom unit which dictates the scheme, for the hotel guest-floor plan consists in the main of an orderly arrangement of cell units, and unless the steelwork plan is organised in sympathy with this principle of units, innumerable difficulties arise in the layout and treatment of the rooms themselves.

The guest-room unit in America consists, in practically every case, of bed and bath and lobby, or combinations of this theme. The standard practice at present is to group two inside bathrooms around a common vertical ventilating shaft, for—at any rate in the commercial type of hotel—the well-ventilated inside bathroom has been found superior to that located in the outside wall. With the inside bathroom fresh air passes from the bedroom into the bathroom, and so into the extract shaft, but with the outside bathroom there is the reverse process, and bathroom odours tend to be drawn into the bedroom.

The hotel bedroom will consist of a unit of some such size as 9 ft. by 15 ft., 11 ft. by 17 ft., up to 15 ft. by 18 ft. in the case of double rooms, the smallest single room being about 8 ft. by 14 ft. The ceiling height to the under side of the floor slab will measure from 8 ft. 8 in. to 9 ft. 2 in.

The standard width for carpet weaning is 2 ft. 3 in., and where possible consideration is given to planning bedrooms in multiples of this width. The same thing applies to corridors. Both main and secondary corridors are usually planned with a marble or terrazzo

border, with a central carpet strip; main corridors are often 7 ft. 6 in. wide, and secondary corridors 6 ft., and as the widest commercial carpet strip is not made over 6 ft. wide, it is apparent that a great width of corridor would lead to expense in the ordering of special strips or the sewing on of borders.

The architectural appearance of the bedrooms is, of course, considerably affected by the planning of the steelwork, and if a stanchion spacing coinciding with the full length of a bedroom-plus-bathroom unit can be adhered to, say 22 or 24 ft., it is possible to run the main beams lengthwise over the partitions and down the centre of the room, a fairly neat arrangement. The suspended ceiling would naturally overcome all difficulties of a broken ceiling surface, but it is more expensive and there is loss of effective ceiling height, so that it is not always feasible.

Interior partitions in the bedrooms are usually of hollow tile or gypsum block, 3 in. thick, and plastered on both sides. There is also used a special partition of solid plaster only 2 in. thick, which saves space, but which requires specially reduced wall outlets and electrical fittings if they are to be countersunk for a flush finish.

The plan of the guest bedroom has become so standardised that there is little possibility of variation in the items of its furnishing. It may be of interest, however, to examine the equipment of a bed- and bathroom in the Pennsylvania Hotel, where everything essential has been included for the comfort of the traveller.

Doors and windows are of metal, as is also the "trim," including door frames, architraves and skirt-

ing. The latter is made with a curved bottom edge, over which laps the carpet, tacked to a wood fillet let into the concrete floor all round the room. By this system carpets can easily be taken up for cleaning, and there is no crack between the concrete floor and the bottom of the skirting.

The rooms have ample lighting, with an average of four points per room—a ceiling light, and lights at the dressing-table, the writing-desk and the bed head. All the lights are independent.

The furniture of the bedrooms in the Statler Hotel is of a very simple modern type, devoid of ornament, of a dull reddish brown finish; it is of a type which does not readily become shabby. All the tables have plate-glass tops, and beneath these are displayed notices which detail information regarding the hotel services, and which list the telephone numbers of the house directory.

Everything in these hotels is ordered by telephone, and it is very easy to make all one's arrangements and even purchases of tickets, etc., without leaving one's room. It is also possible to communicate with any other guest room, and it is the practice to "call" guests in the morning by telephone instead of knocking at their doors. The operator continues ringing until the 'phone is answered, and then greets the sleepy guest with an almost painfully bright "good morning."

The arrangements for the furniture of single and double bedrooms are very similar. We show in Figs. 1 and 2 plans of the arrangement of furniture in a single room and also in a suite of sitting-room and double bedroom at the Pennsylvania. In all of these rooms is placed a guest book, giving information about the hotel and New York in general, a catalogue of the hotel library, and a copy of the Bible, while to the room every morning is delivered without charge a copy of the New York *Times* and a copy of the

Pennsylvania Register. The *Register* is a small daily newspaper published by the hotel, the only one of its kind in the United States; it deals with matters of current interest, political and financial, and with travel news generally. It carries, of course, a good deal of advertising matter, and is actually revenue producing; it is printed on the premises in the hotel's printing works.

No small item of equipment is omitted from the hotel rooms; there is even a complete assortment of buttons and needle and thread attached to the pin-cushion of every dressing-table, while in the matter of writing material there is a supply of stationery of every shape and type. Supplies of this kind are replenished daily from a trolley which circulates from room to room, and which not only carries all the material for room cleaning, such as vacuum cleaner, dusters, soiled linen bag, etc., but contains replenishment of bed linen, matches, stationery and towels. By this system any material used is at once replaced, and the upkeep of the guest rooms maintained with efficiency and with a minimum of disturbance to the guest.

Privacy of the bedroom is assisted by the placing of the bathroom on the corridor side, as this necessitates a lobby which acts as a buffer between the bedroom and the noises and light of the public corridor.

In this lobby are placed the doors to the bathroom and the clothes cupboard, thus masking the entrance to the bathroom from the bedroom, and eliminating in the latter the necessity for a cumbersome wardrobe. This arrangement also permits any number of bedrooms to be placed *en suite*, and also results in economical construction, as there is a minimum amount of external wall space allotted to each bedroom unit.

The door into the lobby from the corridor is fitted in some cases with a "Servidor," a cabinet built into

Fig. 6.—THE PENNSYLVANIA HOTEL, NEW YORK: A TYPICAL BATHROOM. NOTE THE CABINET OVER WASHSTAND, BEHIND WHICH IS THE VENTILATING AND DUCT SHAFT. NOTE ALSO THE NEATNESS OF THE PLUMBING CONNECTIONS.

Fig. 7.—THE PENNSYLVANIA HOTEL, NEW YORK: A TYPICAL BEDROOM.
MESSRS. MCKIM, MEAD & WHITE, Architects.

the space usually occupied by door panels, and fitted with two doors, one of which opens into the corridor and the other into the bedroom. (Figs. 4 and 5).

In this cabinet can be deposited clothes to be cleaned or pressed, shoes, and soiled linen in the special paper bags which hang in the cupboards in every bedroom, and these articles are then removed from the corridor side after a 'phone request to the department concerned, without, of course, in any way disturbing the guest.

In a similar way deliveries to the room are made by "Servidor," a small indicator on the door indicating to the guest when delivery has been made. The cabinet is fitted with a patent interlock, which mechanically prevents both cabinet doors being opened at one time. In this way entrance, or even visibility, into the guest room through the "Servidor" cabinet is rendered impossible.

Automatic locks to guest-room doors are not in favour in American practice. The door is locked on leaving the room with a key, in addition to which there is an internal safety latch. The system also of automatic control of lights through the opening and closing of the room door is not in favour. Its first cost of installation is against it, and the mechanism very readily gets out of order.

Every room in a modern American hotel has a private bath, the higher-priced rooms having tubs and the remainder shower-baths. Bathrooms are grouped in units, usually consisting of two bathrooms which share a common vent and pipe shaft containing all the hot and cold-water services, the drainage, and the ice-water and other piping. These shafts also ventilate the bathrooms, being connected to a plenum system which provides the necessary circulation of air.

The bathroom fixtures are placed along the wall of the vent shaft, and as a general rule there is a hinged medicine cabinet or mirror which can be made to swing out and provide an access to the shaft and the piping which it contains.

The bathroom fittings are neat, and do not, as a rule, emulate the luxury of materials which is found in some of the great London hotels, such as the Savoy; but there is no lack of convenience, the details such as towel hooks, shelves, racks for clean towels, built-in soap and toilet receptacles being carefully considered and conveniently placed. The plumbing is neat, unobtrusive, and efficient. Showers, and a constant supply of ice-water, are, of course, found in practically every bathroom.

It is impossible to conclude this survey of rooms and their fittings without paying a tribute to the genius of Mr. E. K. Statler, who has been so largely responsible for setting a high standard in American hotel accommodation. The wonderful organisation and complete service in his hotels has been very largely built up through the suggestions made by his hotel guests on the suggestion pad which forms a part of the telephone in each guest room of the Pennsylvania. The result is experienced in the speed and completeness with which the needs of the guest are met, at a cost which is moderate considering the generally high prices prevailing in America. Hotels of this type rather spoil one for English and Continental accommodation on a similar basis; there is no doubt that America leads in catering for this particular class of business, though in respect of the de luxe hotel there is nothing in America which surpasses the best European examples.

The President of the Royal Institute of British Architects (Mr. E. Guy Dawber, A.R.A.) is confined to the house by illness, and will probably be unable to keep his public engagements during the next two or three weeks.

R.I.B.A. Notes

Bequests to the Royal Institute of British Architects

The Royal Institute of British Architects have recently received the following bequests for the purpose of founding scholarships or bursaries for architectural students:—

(1) THE LATE MR. A. C. HOUSTON, A.R.I.B.A.

Under the will of the late Alfred Charles Houston the residue of his estate is bequeathed to the R.I.B.A. for the purpose of providing educational and maintenance scholarships for the sons of architects and artists who may be or at the time of their death were in impecunious circumstances, such scholarships to be known as "The Houston Scholarships."

The amount to be received is not yet ascertainable.

(2) THE LATE MR. C. W. HUNT, A.R.I.B.A.

Under the will of the late Charles William Hunt, the sum of £500 is bequeathed to the R.I.B.A. for the purpose of forming a fund the income of which shall be applied annually in the purchase of book prizes, medals, or in such manner as the Institute shall think fit, for the person or persons of British nationality, and under the age of 30 years, who each year, in the opinion of the Institute, submit the best plans, drawings, or designs in connection with housing and town-planning or similar purposes.

The residue of the estate up to £2,000 is to be divided equally between the Vicar and Churchwardens of the Parish of Burwell and the R.I.B.A., for the same objects as the legacies before bequeathed.

The estimated residuary estate is stated to amount to £3,118.

(3) THE LATE MR. DELISSA JOSEPH, F.R.I.B.A.

Under the will of the late Mr. Delissa Joseph, subject to the payment of certain legacies, the Institute will receive, after the death of his wife, one-quarter of the residue of his estate for the purpose of founding an annual bursary, to be known as "The Delissa Joseph Bursary," to be awarded annually, subject to conditions to be from time to time laid down by the President for the time being, to an approved student, or students, who shall have passed the necessary qualifying examinations of the R.I.B.A., to enable him, or them, to visit the United States for the purpose of studying architecture. Each student to whom the bursary is awarded shall on his return furnish a written report on his visit, which shall be printed in the Journal.

Mr. Joseph, who died on January 10, left estate of the gross value of £32,606, with net personalty of £25,925.

Coming Events

The Association of Architects, Surveyors and Technical Assistants.—On June 18 the Annual General Meeting of the Association will be held, followed by a dinner at 7.30 p.m. at Anderton's Hotel, Fleet Street.

Royal Institute of British Architects.—On June 20, the Sixteenth General Meeting (Business) will be held.

The Surveyors' Institution.—On June 22-25 the Annual Country Meeting of the Institution will be held at Harrogate. The dinner will be held at the Queen Hotel on June 23 at 7.30 p.m.

Institute of Welding Engineers.—On June 22, at The Engineers' Club, Coventry Street, London, W.1, at 8 p.m., a Paper, entitled "The Red Shortness of Weld Metal," will be read by A. H. Goodger, Esq., M.Sc. Tech.A.I.C.

Royal Institute of British Architects.—On June 24, the Annual Dinner of the Institute will be held in the Grand Hall, Hotel Cecil, Strand, at 7.30 p.m.

New Ways and Means

*The Editor will welcome early information of
New Plant, Materials and Fittings*

Patent Matchboarding Cramp: Vertical Position.
(S. A. Daniell, Ltd.).

A Patent Match-boarding Cramp

A matchboarding cramp, designed for cramping the boards in almost any position and at any angle to the rail, has been placed on the market by Messrs. S. A. Daniell, Ltd., of Lion Works, Edward Street Parade, Birmingham. The illustrations given show the cramp in use vertically and horizontally on matchboarding laid at right angles to the rail. The adjustment screw of this tool is fitted internally with a device for tightening the grip when the cramp is used in the vertical position. The cramping of the matchboarding is effected by a lever and rack actuating the plunger, and here again any tendency for the boards to slip before they are securely nailed has been overcome by fitting a pawl to the lever, which is kept in contact with the rack by means of a coiled spring. When used for cramping the boards obliquely to the rail, a plunger having a swivelled head is substituted for the one shown in our illustration. The framework and plunger of this tool are of malleable iron; the spindle and lever of steel.

Two New Spraying Pistols.
(Aerostyle, Ltd.).

A Concrete Mixer with Several New Features

A concrete mixer in which the main bearings are entirely independent of the mixing drum, and are protected from grit by special spring-loaded glands, thus increasing the life of the machine, has been added to the range of builder's plant made by Messrs. Triangular Construction Co., Ltd., of Imber Court, East Molesey, Surrey. This machine, which is of the open drum type, is power driven, and can be arranged for either a right or left hand discharge at will, the change-over being made in a few minutes with the aid of a spanner. The main shaft carrying the shovels, or mixing blades, revolves at a speed of 22 r.p.m., and the shovels are arranged right and left handed so that the mix is passed from side to side of the drum about 44 times per minute, and is completely turned over twice during each revolution. These shovels are also adjustable, so that any wear can be taken up as it occurs, whilst the plates of

The "Trianco" Concrete Mixer.
(Triangular Construction Co., Ltd.).

the mixing drum itself are standardised and can be renewed when necessary. The capacity of this "Trianco" Concrete Mixer is five cubic feet, and under normal working conditions its output is approximately five cubic yards per hour.

Some New Paint Spraying Equipment

The portable paint spraying plant which we illustrate has been introduced by Messrs. Aerostyle, Ltd., of 174-176 St. John Street, Clerkenwell, E.C.1. This new model has been specially designed to provide for a portable unit which does not exceed 60 lbs. in weight, so that it can be moved from place to place by one man. Compactness is also one of its salient features, the overall height and width, with a paint container of one gallon capacity, being 31 in. and 10 in. respectively. A paint filter and a paint agitator are provided as part of the equipment, and a locking device is fitted to the handle of the paint container to allow the set to be

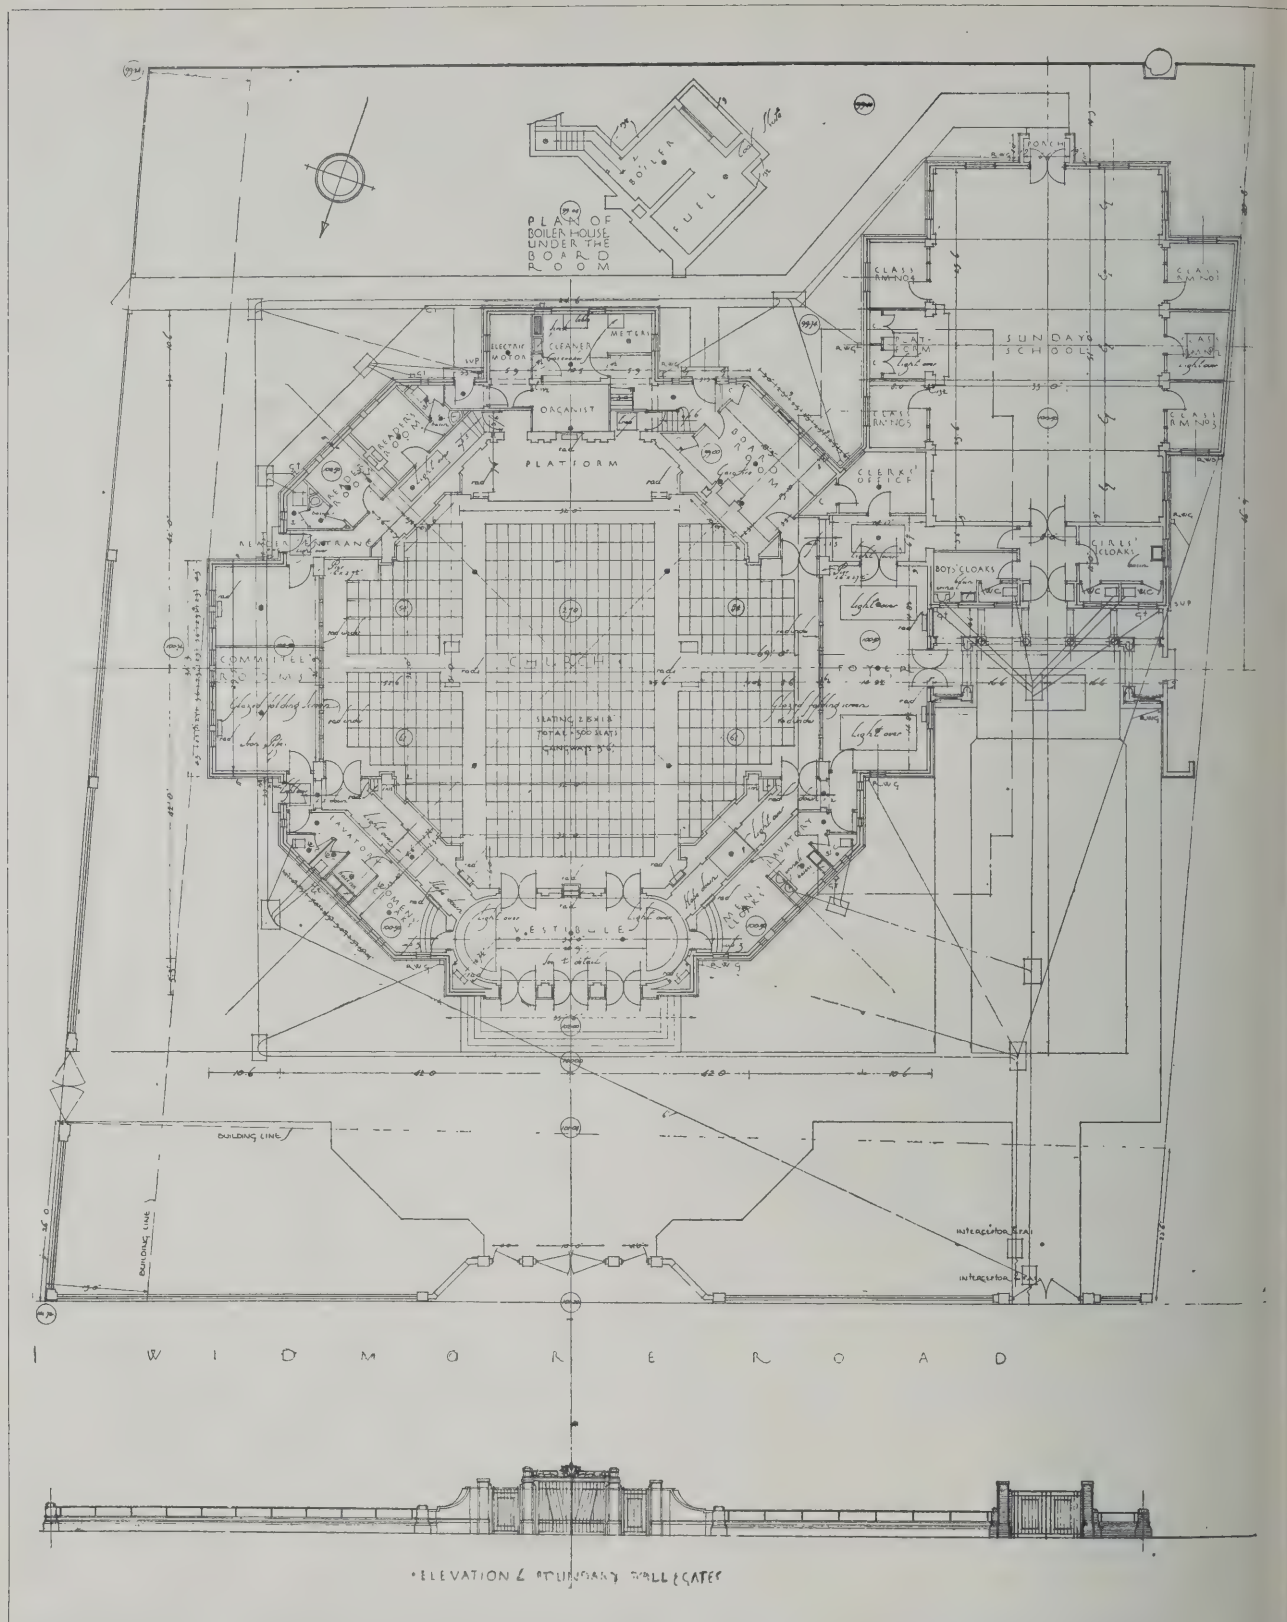

The "Aerostyle" Portable Paint Sprayer.
(Aerostyle, Ltd.).

slung or hoisted to any position on the job. The reducing valves incorporated permit the use of any compressed air supply from 50 lbs. to 150 lbs. per square inch; the consumption of air when painting continuously is 8 to 10 cubic feet per minute. This equipment can be used with any class of paint, enamel or varnish, as well as distemper and bituminous products, slight adjustments being made in the apparatus itself to avoid undue thinning of the material used. Our second illustration shows two new models in pistol sprayers, also introduced by the same firm. Model "S" is of an entirely new design, put out to appeal to those who prefer to have the bowl underneath, so that the paint spray is "pressure fed." It can, however, be adapted for gravity feed, by swivelling the bowl into the upper position. Model "C" is an improved pattern of their standard sprayer, with the addition of an adjustable head for giving either a concentric or a flat spray.

Window-Dressing Competition

In our issue of March 4 last we drew attention to the prizes offered by Messrs. Robert Ingham Clark & Co., Ltd., and Messrs. R. Gay and Co., Ltd., of West Ham Abbey, London, E.15, for the best window displays of their various paint and varnish specialties. The names of the prize-winners in this competition have been announced as follows:

First Prize.—Thompsons (Portsmouth), Ltd., Somers Road North, Portsmouth.

Second Prize.—John Hadland, Ltd., 62-68 Plashet Road, Upton Park, E.15.

Third Prize.—Alfred Olby, Ltd., 25-29 King Street, Ramsgate.

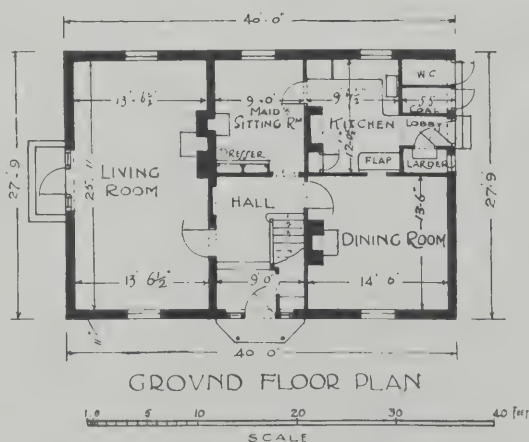

Highly Commended.—1, Anderson, Stanford & Ridgeway, 28, 29 Grafton Street, Dublin, Irish Free State; 2, Ashcrofts, Ltd., 21 Prospect Hill, Douglas, I.O.M.; 3, Ashworth, Armitage & Ellison, Ltd., 258-260, Corporation Street, Birmingham.

The Memorial Arch at Menin Gate, to commemorate the troops who fell in the Ypres salient, will be formally opened by F.M. Lord Plumer on Sunday, July 24. Sir Reginald Blomfield, R.A., is the architect.

HOUSE ON THE QUEENSMERE ESTATE, WIMBLEDON PARK.
H. E. Moss, A.R.I.B.A., Architect.

HOUSE ON THE QUEENSMERE ESTATE, WIMBLEDON PARK.
H. E. Moss, A.R.I.B.A., Architect.

This house was erected during 1925 at a cost of £2,143, inclusive of fencing, drainage and Quantity Surveyor's fees. The main walling is of London stocks with hand-made red dressings to the windows and quoins. The roof is tiled with pantiles at a pitch of 35°. The principal sitting room and hall have polished oak floors. Constant hot water is provided by a No. 2 Ideal Boiler, which also serves the radiator in the hall, the towel rail in the bathroom, and a coil in the linen cupboard. Mr. C. H. King, of New Malden, was the builder.

THE NEW NOTTINGHAM EXCHANGE BUILDINGS: THE EXCHANGE ROW.
T. CECIL HOWITT, A.R.I.B.A., Architect.

Let facts guide you . . .

Before forming an opinion of an article, thinking men summarise the available facts, and the more facts there are to consider, the clearer is their judgment.

Marseilles Roofing Tiles have been used on over 25,000 houses in England alone since 1921.

Of all tiles, these are the most easy to lay.

Once laid, they are locked on the roof, and cannot slip out of position.

Nevertheless, it is perfectly simple to replace a tile at any time should the necessity arise.

Their first cost is extremely low. Marseilles Tiles weather delightfully and quickly; they acquire a mottled appearance.

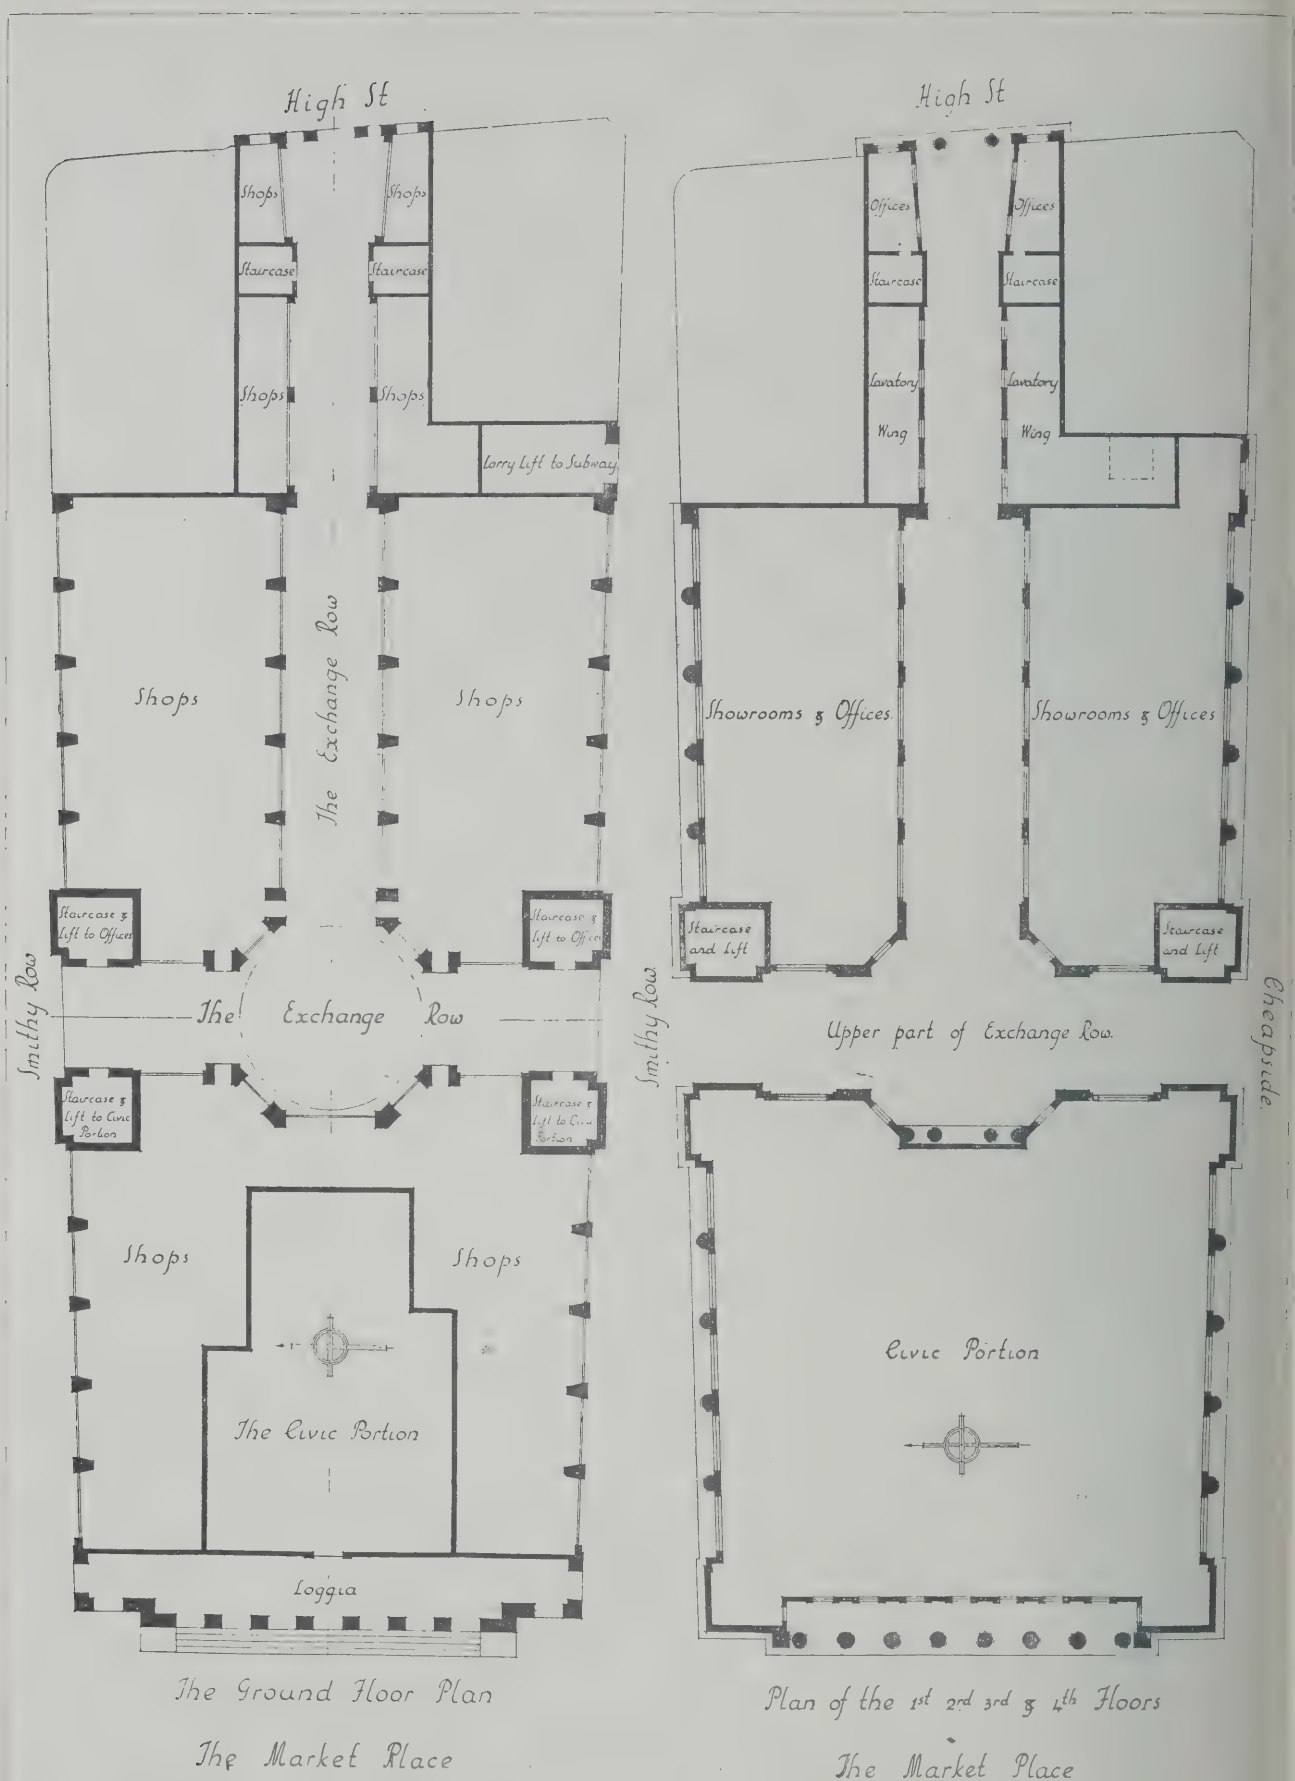

You will find it helpful to see and handle the actual tile.

We will gladly let you have a sample, together with Catalogue M.1.—just send us a postcard.

THE NEW NOTTINGHAM EXCHANGE BUILDINGS.
T. CECIL HOWITT, A.R.I.B.A., Architect.

If a Columbian Pine Door is painted or covered with a cheap stain it ceases to be "A Thing of Beauty," but, stained with Solignum, it remains "A joy for ever."

Solignum improves with age. It does not scratch or show fingermarks; and, to quote the words of a prominent user, "It is the most perfect and economical stain for indoor work ever introduced."

Dry rot and decay cannot exist where Solignum is used.

Regd. Trade Mark.

*For indoor staining and
Decorative work In-
terior Quick Drying
Solignum should be used.
For protection against
Dry Rot specify Ex-
terior Brown Solignum.*

*We offer co-operation in Dry Rot Cases. Write to
Major & Coy., Ltd., 205 Borough High Street, London, S.E.1*

London Building Notes

ALDWYCH.—It is proposed to build additional lecture and class rooms upon a portion of the site adjoining the London School of Economics. The property, in Houghton Street, W.C., forms part of a large site upon which will eventually be erected an extensive building, designed by Messrs. Trehearne & Norman, F.R.I.B.A., Windsor House, Kingsway, W.C.2.

CAMBERWELL.—Plans have been approved by Messrs. Truman, Hanbury, Buxton & Co., Ltd., Brick Lane, Whitechapel, E.1, for the complete reconstruction of their licensed premises in New Church Road, Camberwell, S.E., known as the "Admiral Codrington." The new public-house will include a large restaurant and clubroom, and has been designed by Messrs. Sedle & Myers, architects, 8 Railway Approach, London Bridge, S.E.1.

EAST HAM.—A block of business premises, including shops with living accommodation, is to be erected upon a site in High Street South, the work to be shortly commenced. Arrangements are in the hands of Mr. V. C. Jackson, High Street South, East Ham.

EDGWARE.—Old property in the Edgware High Street is to be demolished, consequent upon a change of ownership of the frontage land. A row of shops, with flats above, is to be erected to the design of Mr. A. J. Butcher, A.R.I.B.A., 2 Premier Parade, Edgware.

FINCHLEY.—The public-house in Ballard's Lane, North Finchley, N., known as the "Moss Hall Tavern," is to be rebuilt. The contract has been placed with Messrs. Douglas Halse & Co., Ltd., 24 Green's End, Woolwich, S.E.18. The plans have been prepared by Mr. William G. Ingram, F.R.I.B.A., 4 Verulam Buildings, Gray's Inn, W.C.2.

FLEET STREET.—The present owners, Messrs. Marcus Estates, Ltd., have in contemplation the erection of a modern office building at No. 131 Fleet Street. The plans have been prepared by Messrs. Trehearne & Norman, F.R.I.B.A., Windsor House, Kingsway, W.C.2, and show a block of five floors, with basement.

GREAT WEST ROAD.—A local firm of brewers have acquired a site at the corner of the Great West Road and Sutton Lane, W., where it is proposed to build a new public-house, designed by Messrs. F. J. Fisher & Son, F. & A.R.I.B.A., 38 Bloomsbury Square, W.C.1.

GREENWICH.—A scheme is under consideration by the Admiralty for the conversion of the Queen's House at Greenwich, S.E., into a National Naval and Nautical Museum. The building is shortly to be vacated by the Royal Hospital School, and will then be available for conversion into a museum. The proposal is in the hands of the Office of Works, whose chief architect is Sir R. J. Allison, F.R.I.B.A.

HAMPSTEAD.—Funds are being raised for the purpose of commencing

work upon the erection of a new church hall in connection with St. Luke's Church, in Fortune Green Road, Hampstead, N.W. The new building will accommodate about 300-400 persons, and will be erected to the designs prepared by Mr. Bernard J. Dicksee, F.R.I.B.A., 33 Templars' Avenue, Hampstead, N.W.11.

HENDON.—A new church is to be erected by the Christian Brethren upon a site at the corner of Woodcroft Avenue, on the Watling estate, at Burnt Oak, Hendon. The builders are Messrs. J. Laing & Co., Ltd., Lincoln House, High Holborn, W.C.2.

HENDON.—A row of shops, single and double fronted, is to be erected in the near future upon a site in close proximity to Hendon railway station, plans for the buildings having now been completed. The architects are Messrs. D. Morris & Sons, Ltd., Charing Cross, Westminster, S.W.1.

HOUNDSDITCH.—A telephone exchange is to be erected on the site of Phil's Buildings and the Old Clothes Market, Houndsditch.

HOUNSLOW.—The Gas Light and Coke Co., Ltd., Horseferry Road, Westminster, S.W.1, have secured a site in the Hounslow High Street, where they propose to build a large building for use as branch showrooms. The new building will be in part brick and stone design involving extensive alterations to existing premises. The architect is Mr. Walter Tapper, F.R.I.B.A., 10 Melina Place, St. John's Wood, N.W.

LEYTONSTONE.—A further section of a housing scheme on the Nursery Park estate in Boundary Road, E.10, consisting of a block of 23 houses, is shortly to be commenced. Plans and layout have been prepared by Mr. J. Jacques, L.R.I.B.A., 61 West Ham Lane, Stratford, E.

MUSWELL HILL.—A site in Creighton Avenue and Coppett's Road, Muswell Hill, N., is to be developed for residential purposes, and plans have been approved for 22 houses. The builders are Messrs. A. E. Bailey & Sons, Witherington Road, Highbury, N.

OXFORD STREET.—A firm of publishers have purchased premises at No. 449 Oxford Street, W.1, where it is proposed to open a model restaurant for the purpose of demonstrating good cooking, etc. Plans for the proposed alterations have been prepared by Messrs. Pitt & Prior-Hale, 3 John Street, Bedford Row, W.C.1, whilst the work will be carried out under Messrs. Bovis, Ltd., 43 Upper Berkeley Street, W.1.

REGENT'S PARK.—Arrangements have now been completed by H.M. Office of Works for the disposal of the Abbey Lodge Estate at Hanover Gate, N.W., and the erection of a large block of residential flats. A building of 5 floors is to be erected, containing 56 suites, each self-contained. The architects are Messrs. Wills & Kaula, 22 Southampton Street, Strand, W.C., acting for Mr. Ernest Yates, estate agent. The contractors are the General Building Company, 48 St. Martin's Lane, W.C.2.

REGENT STREET.—New shop and showroom premises are being erected in Regent Street, Glasshouse Street, and Warwick Street, W.1, for the Goldsmiths' and Silversmiths' Co., upon the site of their old headquarters. The builders are Messrs. Nox, Ltd., 44 Praed Street, Paddington, W., whilst steelwork has been supplied by Messrs. Dorman, Long & Co., Ltd., Central Buildings, Westminster, S.W.1. Plans have been prepared by Messrs. North, Robin & Wilsdon, F. & A.R.I.B.A., 35-39 Maddox Street, W.1.

RIPPLE ROAD.—A large block of offices and showrooms is to be built in Ripple Road, to be used by the Barking Electricity Committee, the cost being estimated at £5,000. Plans have been prepared by Messrs. C. J. Dawson, Son & Allardyce, Clock House Chambers, Barking, and the work will be carried out by Mr. H. Newall, 24 Wilson Street, Poplar, E.14.

ST. GEORGE'S-IN-THE-EAST.—A large electricity station is to be erected upon a site in Prince's Square, St. George's-in-the-East, S.E., at a cost of £12,000, consisting of a brick-filled structure in a steel framework. The builder is Mr. W. Simms, 591 Commercial Road East, E., whilst plans have been prepared by Mr. Bernard J. Belsher, F.R.I.B.A., Raine Street, E.1.

WEST HAM.—Plans have been prepared for the complete reconstruction of the premises of Messrs. Dare & Co., in Sugar House Lane, E., and have been approved by the local authorities. The architects are Messrs. Murray, Delves & Murray, 10 King's Bench Walk, Temple, E.C.4.

WESTMINSTER.—In place of old property condemned by the City Council a large block of office premises, six storeys high, is to be erected in Great George Street. The site is now cleared, and building operations are to be put in hand by Messrs. Howell J. Williams, Ltd., Bermondsey Street, S.E.1. The new premises have been designed by Messrs. Arthur Blomfield & Driver, architects, Grocers' Hall, Princes Street, E.C.2.

WILLESDEN.—The Empire Kinema, Willesden, is now being considerably altered for Mr. S. L. Bernstein, to designs prepared by Mr. Cecil Masey, L.R.I.B.A. The general contractors are Messrs. Kirk & Kirk, Ltd., Atlas Works, Putney, S.W.15, and Messrs. Archibald D. Dawnay & Sons, Ltd., Battersea, are doing the structural steelwork. A unique feature of the alteration is the fact that the existing roof is to be raised intact to the new level necessary for the new building.

WOOLWICH ROAD.—A new block of quarters for nurses, etc., is to be added to the Greenwich and Deptford Infirmary in Woolwich Road, S.E., at a cost of about £15,000. Plans have been prepared by Mr. A. Roberts, architect, 92 London Street, Greenwich, S.E., and a contract has now been placed with Mr. T. D. Leng, Czar Street Works, Deptford, S.E.

The Week's Building News

The following abbreviations are used: U.D.C. for Urban District Council; T.C. for Town Council; R.D.C. for Rural District Council; E.C. for Education Committee; B.G. for Board of Guardians; P.C. for Parish Council; B.C. for Borough Council; M.H. for Ministry of Health; M.T. for Ministry of Transport; C.B. for County Borough; B.E. for Board of Education. Direct confirmation should be obtained before commitments, for which we cannot be responsible, are made.

BIRMINGHAM.—A new public-house is to be erected at Chester Road, Erdington, for Messrs. Mitchells & Butlers, Cape Hill Brewery, Birmingham. The architects are Messrs. James and Lister Lea & Sons, Cannon Street, Birmingham.

BLACKPOOL.—Plans have been approved for 10 houses to be erected in Poulton Road for R. Lancaster & Sons, Ltd.; 14 houses in Surrey Bank Avenue, for J. Ridyard; 10 bungalows in Seattle Avenue, for T. Brierley. Mr. Halstead Best, F.R.I.B.A., Clifton Street, has prepared a layout plan of Nuttall's Farm estate for the erection of houses for Boardman & Beardshaw. The Corporation propose to erect a garage at the South Shore Police Station. Quantities are to be prepared for the erection of the second department at Tyldesley School.

BRADFORD.—Mr. Eric Morley, F.R.I.B.A., has prepared plans for the erection of a new infirmary, in Duckworth Lane, for the Board of the Bradford Royal Infirmary, at an estimated cost of £300,000, and which will provide for 400 beds.

BRISTOL.—The Mental Deficiency Act Committee of the City Council has recommended the foundation of a new colony on 126 acres of land, already acquired, at Hortham Lane, Almondsbury, and the erection of buildings to accommodate 608 cases, at a cost of £231,676, including architects' fees.

BRISTOL.—Plans have been passed for the reconstruction of the Palace Picture Theatre, at a cost of about £40,000. The architect is Mr. Frank Verity, F.R.I.B.A., Sackville Street, London, W.

BOSTON.—Mr. S. Marjason, architect, has been engaged to prepare plans, etc., for additions and improvements to the children's nursery and boys' and women's blocks, etc., for the B.G.

CARLISLE.—The Corporation Housing Committee have decided that 300 additional houses be erected in the city, and that the surveyor be instructed to submit to the next meeting a scheme for the erection of such houses on the Botcherby, Raffles, and Blackwell Road estates.

CATTERICK.—The Catterick New Church Building Committee have accepted the design of Mr. Arthur Kellett, L.R.I.B.A., of Barnard Castle, for the new Wesleyan Church, to be erected at an estimated cost of £15,000.

CLACTON.—At an estimated cost of £27,000, new municipal buildings are to be erected for the T.C. to plans prepared by Sir Brumwell-Thomas.

COLCHESTER.—Messrs. Arthur Brocklehurst & Sons, of Manchester, have prepared plans for the proposed rebuilding of the Culver Street Wesleyan Church.

CROMPTON.—Plans have been approved for 10 houses at Ripponden Road, Grains Bar, for W. Longden.

CROYDON.—A row of shops, with

flats above, are to be built upon a site in South End, Croydon, for a coal company. Plans have been prepared by Messrs. North, Robin & Wilsdon, 35-39 Maddox Street, W.1, showing four large shops, surmounted by two upper floors. The builders are Messrs. Bridge & Co., 15 Brighton Road, Croydon.

DARWEN.—The Corporation have decided to build 66 additional houses to meet local requirements—41 at Marsh House, 18 in Cemetery Road, and 7 in Borough Road.

DUKINFIELD.—The Corporation have decided to build 200 houses in all on the Clarendon Fields, and Messrs. Gerrards, the contractors, have offered to erect the 13 extra houses at the same price as their original contract.

EARLSDON.—A new Roman Catholic School is to be erected in connection with All Souls' R.C. Church, Earlsdon, Warwickshire, to plans prepared by Mr. George Cave, architect, of Coventry.

EASTBOURNE.—The Borough Engineer has prepared plans for the development of the remaining portion of the Victoria Drive site by the erection of 96 non-parlour houses.

EASTBOURNE.—The Borough Engineer has been instructed to submit sketch plans for the development of a Redoubt site for the purpose of a music garden, with adequate shelter, and a bathing pool. Alternative plans are also to be prepared for the removal of the Redoubt building.

GREENFORD.—Plans are now being prepared by the Ealing Borough Surveyor for the erection of a new school at Greenford.

HARROW.—The Council proposes to erect 150 houses on a site which is to be purchased in South Harrow. The cost of the scheme is estimated at £90,000, the houses to cost £71,000. Plans have been prepared by Mr. Bennetts, the Borough Surveyor.

HASTINGS.—Messrs. Elgood & Hastie, architects, have prepared plans for additions at Fairlight Sanatorium, Old London Road, Hastings.

HASTINGS.—Plans passed by the Corporation: Class-rooms and dormitories, Summer Fields, for Mr. H. W. Coussens, A.R.I.B.A., architect; 4 houses, Downs Road, for Mr. J. Hunt, F.R.I.B.A., architect; 12 houses, St. Helen's Road, for Mr. H. M. Jeffery, architect; 8 houses, Magdalen Road, for Mr. Harold Burleigh, A.R.I.B.A., architect.

KINGSTON.—The Y.M.C.A. are to erect a building on a site in Eden Street, at an estimated cost of £6,000. The architect is Mr. John P. Blake, A.R.I.B.A.

KINGSTON.—The B.E. have now given approval to the plans submitted by the Surrey E.C. for the new buildings which are to be erected by the governors of the Tiffins Boys' School, Kingston. The architects, Messrs. Jarvis & Richards, A. & F.R.I.B.A., 60

Tufton Street, Westminster, S.W., have been instructed to prepare detailed plans.

LEEDS.—Messrs. G. F. Bowman & Son, architects, are to erect a memorial hall in Adel Lane, Leeds.

LETCHWORTH.—Mr. John Ray is the builder, and Mr. Cecil H. Hignet, F.R.I.B.A., the architect, of a new Elihu Church.

LEWES.—The tender of the Ringmer Building Works has been accepted for the erection of a private residence in Gundecada Road, Lewes. The architect is Mr. E. H. Fuller.

LIVERPOOL.—The authorities of the Wallasey Victoria Central Hospital are preparing plans for a big extension and improvement scheme. The cost, it is estimated, will be about £20,000. Nearly the whole of one side of Croxeth Avenue, which is adjacent to the hospital, is to be absorbed by the institution, and modern central housing quarters are to be provided for the nursing staff. The architects are Messrs. Rees & Holt, of 64 Rodney Street, Liverpool.

LIVERPOOL.—The foundation stone for the new school chapel of St. Cuthbert's has been laid. The plans have been prepared by Mr. A. Gilbertson, architect, Tithebarn Street, and provide for buildings constructed of brick. The school will accommodate 400 children, and the top floor, 112 ft. long by 84 ft. wide, will serve as chapel accommodating 500 people. The presbytery has also to be provided. The whole scheme costing £15,000.

MANCHESTER.—Messrs. Sharrock & Baker, St. Leonard's Street, C.-o. M., are to erect new bakeries on Plumstead Grove, to the plan of Messrs. Butterworth & Andrews, architects, 11, Brasenose Street. Messrs. Bradshaw & Gass & Hope, architects, Silverdale Street, Bolton, are to prepare plans for the proposed works. Extensions, Caroline Street, Broughton, for Messrs. Erskine Heap & Co., Ltd. The Provincial Cinematograph Co., Ltd., Regent Street, London, have under consideration the acquisition of a site on which will be erected a super cinema, with a restaurant and dance hall. Plans have been approved for conversion of billiard hall into bar room at Oxford Street and St. James Street, for P. Frankenburg; alterations to "Unicorn Inn," Hyde Road, at Saw Street, for Boddington's Brewery Ltd.; additions to confectionery department, Grove Street, Ardwick, for Manchester and Salford Co-operative Society; addition to "Pack Horse Hotel," Stockport Road, Levenshulme, for Walker & Homfray, Ltd.; alterations and additions to premises, 1, Stockport Road, and The Green, Levenshulme, for B. Higham.

NORTHAMPTON.—On behalf of the Rector of Abington, Messrs. Laing & Harris & Croft, A. & L.R.I.B.A., are

(Continued on page 1036)

HY-RIB

The Combined Reinforcement and Centering

THE LOCARNO DANCE HALL, GLASGOW.

Architect: Robert J. Walker, I.A.

Contractor: Thomas Stevenson.

HY-RIB FLOORS HAVE BEEN LAID THROUGHOUT.

HY-RIB FLOORS.

Hy-Rib is used in floors in conjunction with any type of beam, reinforced concrete, steel, or wood. Its use is very simple; the Hy-Rib is laid over or between the supports, with the lath side down, and the concrete is poured from above. The concrete flows through the lath surface sufficiently to afford a perfect key. Plaster is applied directly to the under surface as soon as the concrete is set.

Hy-Rib provides in itself the centering and the reinforcement for the concrete, and thus greatly reduces the cost, simplifies the construction, and saves time in erection.

STAFFORD.—June 24.—For extensions to the St. John's Market for the Corporation. Particulars, Mr. W. Plant, A.M.I.C.E., Borough Engineer, Borough Hall, Stafford. Deposit £2 2s.

THE LARGEST PRESSED STEEL TANK in the WORLD

This tank, supplied to the Nairobi Municipality, Kenya Colony, holds *One Million Gallons* of water, and is built from standard plates 4 feet square to a depth of 16 feet.

The Braithwaite Pressed Steel Tank is of standardised construction, built up from unit plates 4 ft. or 1 metre square, which are bolted together; the joints being made tight with a plastic compound of simple application.

The shape of the plates combined with a unique system of staying gives great strength to the tank with the minimum of weight.

The two sizes of unit plates give an exceedingly wide range of capacities, and tanks can be provided in depths up to 16 feet or 4 metres for water, fuel oils and other liquids.

A large stock of component parts is always available, and careful marking for erection ensures successful installation, skilled labour being unnecessary.

Future needs can be provided for as increased capacities can be given by extending tanks already in use.

John Laing & Son, Ltd., at £113,710 for 290 of the non-parlour type, and £30,582 for 70 of the parlour type, subject to sanction by the M.H. and the L.C.C. The Borough Engineer has been appointed architect for the scheme.

CABLES with a CERTIFICATE

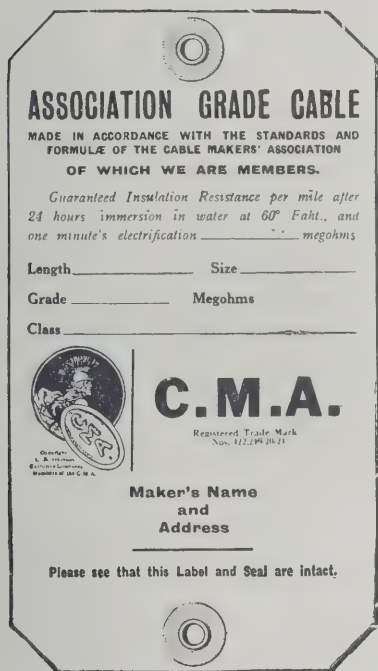

In specifying electric cables for installations, Architects can secure a definite quality by specifying **"C.M.A."** where the highest quality is desired; or

Reg. Trade Mark No. 422219-20-21

"NONAZO" where a sound cable at a lower price is necessary

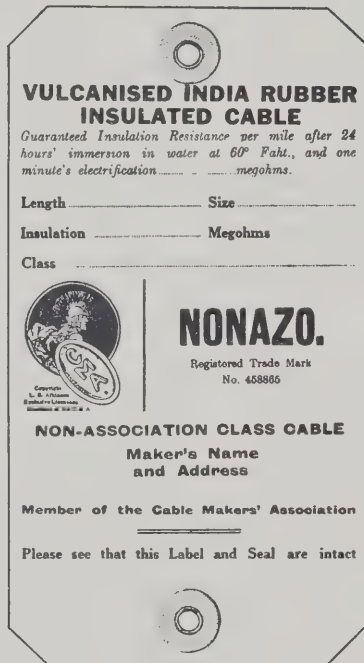

Reg. Trade Mark No. 458865

To ensure getting the quality specified insist on seeing the labels from every coil

The Week's Building News

(Continued from page 1028)

to develop the Abington Glebe estate, near Northampton.

NORTHAMPTON.—Plans passed by the Corporation: 8 houses, The Drive, for Messrs. Walker & Perrett, L.R.I.B.A.; 14 houses, Balfour Road, for Mr. A. E. Thompson.

NOTTINGHAM.—Messrs. Boots, Cash Chemists, Ltd., have acquired a site of about 200 acres at Beeston for the erection of a new building to house their soap and toilets departments.

PORTSMOUTH.—The Wesleyan authorities are to erect a new central hall, estimated to cost £30,000, at Fratton Road, to the plans of Messrs. A. Brocklehurst & Co., architects, Norfolk Street, Manchester.

ROCHDALE.—The Rochdale Amusements, Ltd., are to erect a super cinema and café at Drake Street. Messrs. Butterworth & Duncan, architects, 2 Baillie Street, are to prepare the plans. The scheme is estimated to cost £30,000. The E.C. are to provide an extension to the open air school, which will accommodate 30 children.

ROMFORD.—The Essex County architect is to prepare plans for the construction of a swimming bath at the Royal Liberty School.

SAFFRON WALDEN.—Costing £20,000, a new convent is to be built, the architect and builder of which will be Mr. T. Ennion, of Reading. The whole structure will be of hand-made red bricks.

SALFORD.—The E.C. propose to erect a three-department school at Kersal, with accommodation for 1,100 children. Plans have been approved

for the layout of land and erection of 15 dwelling-houses at Verdum Avenue, for J. Hill & Son. Additions to Broughton Assembly Rooms, Gt. Cheetham Street, for A. Casel & Sons.

STACKSTEADS.—The foundation stone for the proposed new church of St. Joseph's has been laid. The architect for the scheme is Mr. R. Byom, A.R.I.B.A., of Bury.

ST. ALBANS.—The architect is Mr. Percival P. Blow, and the builders are Messrs. J. T. Bushell & Son, of a new wing to the High School.

STANDISH.—The local council has approved of plans for the erection of two new cinemas.

STOCKPORT.—The Stockport Industrial Co-operative Society proposes to make alterations to their Wood Street branch. Mr. Norman Jones, architect, Lord Street, Southport, has prepared plans for the erection of a new office block, estimated to cost £37,000.

STOKE-ON-TRENT.—The Corporation Housing Committee have made arrangements for the erection of 150 houses for the employees of the Michelin Company. The architect is Mr. A. Burton, M.I.C.E., F.S.I., City Surveyor, Town Hall, Stoke-on-Trent.

STOWE.—The Queen recently laid the foundation stone of the large memorial chapel to be built at Stowe School. This building, which will complete the building programme of the school governors, will cost £40,000, providing seating accommodation for 600. The plans have been prepared by Sir Robert Lorimer, R.A., 17 Great Stuart Street, Edinburgh.

TORQUAY.—Messrs. F. E. Laarer &

Son are to erect new premises at No 24-26 Victoria Parade, Torquay. The architects are Messrs. Watson & Watson, Torwood Street, Torquay.

TYNEMOUTH.—The Corporation have obtained sanction for a loan of £6,600 for the construction of a pavilion at the bathing pool. Plans have been prepared by John F. Smillie, borough surveyor, Tynemouth.

UTTOXETER.—The B.G. are to proceed with the erection of a mortuary, and Mr. S. S. Proud, surveyor, Uttoxeter, is to prepare plans and specifications.

WANTAGE.—Princess Helena Victor is to open a new hospital at Wantage on June 30. Costing £16,000, it has been designed by Messrs. A. T. Webb & Son, The Knowle, Abingdon, Berks.

WARRINGTON.—A new church is to be erected on a site at Padgate, near Warrington, for the Rev. Father J. J. Hind, of St. Mary's, Buttermarket Street, Warrington. The architects are Messrs. Wright & Hamlyn, Winmalley Street, Warrington. The contract has been let to Messrs. John Dolan & Sons, Napier Street, Warrington.

WATFORD.—Messrs. Kempster Williams, F. & L.R.I.B.A., are to erect 50 houses on the Leggatts Rise estate, Watford.

WELSHPOOL.—Montgomery C.C. have decided to erect offices in Welshpool at a cost of £10,000, including furnishing. A site for the new building situated near the railway station, has been offered free of cost by the Welshpool T.C. The architects are Messrs. Briggs & Thornely, Royal Liver Building, Pier Head, Liverpool.

50 TONS OF WATER

Roof of Mr. J. LEALE'S
factory at Guernsey, hold-
ing 50 tons of water,
waterproofed with
VULCANITE.

on a VULCANITE ROOF!

No need to fear rain dripping through a roof covered with a material that will stand that strain!

Vulcanite Roofing is absolutely water-tight and weatherproof. It is Fire Resisting, too, when covered with sand and gravel or $\frac{1}{2}$ inch of tar macadam. Low in first cost, its long life makes it not only the best but the most economical roofing on the market.

Roofs covered with Vulcanite are safe for years. This is why Vulcanite has been used during the past 30 years by Architects who want the best and who study their clients' expenditure as well as their own reputation.

VULCANITE FLAT ROOFING

Complies with the London Building Act and Building Bye-Laws of all Borough and Urban District Councils requiring an incombustible exterior roof covering, and is accepted by all the leading Fire Insurance Companies as a full Tariff Roof.

WIN THE FIGHT AGAINST DAMP BY USING
**VULCANITE
DAMPCOURSES**

A SUGGESTION

MAY we suggest that before purchasing Fireplace Suites or Sanitary Appliances you and your Clients should visit our recently re-arranged Showrooms at 17 & 18 Upper Thames Street, London, E.C.4.

The range of Fireplace Suites offered for inspection is a very wide one. A special feature is the number of beautiful Period Designs, many of which we owe to our own craftsmen of a century ago.

The Register Grate illustrated is in Armour Bright finish and fitted with the Hot Hearth Fire. It is particularly suitable for office or country house use.

BUILDING WAGE GRADES

Grade Classification	A	A1	A2	A3	B	B1	B2	B3	C	C1
Standard Rates	1/8	1/7½	1/7	1/6½	1/6	1/5½	1/5	1/4½	1/4	1/3½
Labourers' Rates	1/3½	1/2½	1/2½	1/2	1/1½	1/1½	1/1	1/0½	1/0½	-/11½

The following are the gradings of towns in England and Wales. The rates quoted apply to all craftsmen, with the exception of those marked with an asterisk, which denotes that there is a differentiation in the rate paid to painters, details of which are given separately at foot. The London rates are:—Within a 12 mile radius from Charing Cross—all craftsmen (excluding painters), 1s. 9½d.; painters 1s. 8½d.; labourers, 1s. 4½d. From 12 to 15 mile radius, all craftsmen (excluding painters), 1s. 9d.; painters, 1s. 8d.; labourers, 1s. 4d.

THIS IS AN ABBRIDGED LIST; THE GRADINGS OF OTHER TOWNS MAY BE HAD ON APPLICATION TO THE EDITORIAL OFFICE OF THIS PAPER

NOTE:—Our Readers may be interested to know that this issue of "The Architect and Building News" will be seen by practically every practising Architect in the Dominions and Colonies of the British Empire, and will, it is hoped, be regarded by our confrères Over-Seas as a modest epitome of every-day British practice in solving problems of design and construction that are common to the English-speaking peoples.

Control of Building Design

Mr. E. J. Elford, the Borough Engineer of Wandsworth, makes a pertinent reply to Mr. Guy Dawber on the subject of controlling the design of new buildings, to which we referred in a leader last week. Mr. Elford points out that local building committees have no power whatever, in passing, criticising or condemning drawings submitted for their approval, to take cognisance of "what the building may look like in execution," and that their duties are strictly confined to enforcing the provisions of by-laws dealing with certain structural and sanitary matters. This, no doubt, is strictly true on paper, but we have in mind more than one instance in which an enlightened local building committee, by tactful suggestions, brought about considerable improvements in designs for buildings submitted for their approval. Mr. Dawber had in mind, no doubt, the power of controlling design that may be acquired by local authorities under the Town Planning Acts. Mr. Elford has a parting shot, that "among architects, there is not always agreement as to what constitutes a beautiful design." He would find, however, a fairly general agreement of what constitutes a thoroughly bad design. Nor can it be said that the Institution, of which Mr. Elford is a distinguished member, by opposing the Architects' Registration Bill, has helped to promote the better æsthetic education of those who are called upon to design buildings.

Another correspondent of *The Times*, Mr. Francis Bacon, reproaches the "eminent architects" for

being too nervous about their reputations to run the risk of giving a trial to the cheaper and more efficient building materials that are being evolved, with the result that the uneducated jerry-builder "rushes in where angels fear to tread." Mr. Bacon points his moral by a reference to the pink asbestos tile, but he has evidently heard only half the story. "Eminent architects" had every opportunity of judging the effect of pink asbestos tiles on the jerry-builders' erections, and disliked it. Some eminent architects, acting in a temporary capacity as advisors of a Government Department which was responsible for supervising a large amount of housing work, put an absolute veto on the use of the pink asbestos tile, and were upheld by their Department. That veto became known throughout the length and breadth of the land, and the manufacturers of asbestos roofing material very wisely set about meeting the opposition in the best possible way. They produced the not unpleasant brown tile, to which Mr. Bacon refers, also some black tiles, some good pantiles, and large corrugated tiles and corrugated sheets in the natural colour of their material, which, also, is by no means unpleasant. So that the ban of that particular Department was lifted in regard to these new forms of asbestos roofing, which were, subsequently, largely used on buildings with which the Department had to deal. Can Mr. Bacon give any satisfactory reason, therefore, for urging that eminent architects should experiments with the forms which they were convinced did not give satisfactory results from the æsthetic point of view?

Houghton House, Beds.

Under the heading of "Bunyan's House Beautiful," *The Times* has given publicity to an appeal, put forward by Professor A. E. Richardson in conjunction with the Bedford Arts Club, for funds required to purchase and preserve the remains of Houghton House, Ampthill, Beds., which is said to have been the inspiration for the "very stately palace . . . the name of which was Beautiful," in Bunyan's "Pilgrim's Progress." That it may well have been so will be apparent to architects, since it was designed in 1615 by John Thorpe for Mary Countess of Pembroke, the sister of Sir Philip Sidney. The completion of the building appears, however, to have been carried out by Inigo Jones, and the considerable remnant standing to-day exhibits work characteristic of both these masters. After the Countess of Pembroke's death the house was granted to the Bruce family, was purchased in 1675 by the Earl of Aylesbury, and in 1738 by John, Duke of Bedford. In 1765 Sir William Chambers was commissioned to carry out repairs and alterations for the Marquis of Tavistock, but the latter was killed in the hunting-

field before he had occupied the place. The house then became the residence of Lord Ossory for some years, but in 1794 the 5th Duke of Bedford decided to dismantle it. The great staircase was sent away to the Swan Inn, Bedford, the chimney-pieces were taken out and the roof removed; and the fabric has since been left to its fate. The amount required to secure the remains, which it is intended to present to the Town of Ampthill as a public monument, is not large. A number of donations have already been received, but an appeal, which is supported by *Country Life* and the Architecture Club, is made for the £100 required to complete the purchase price and for the additional monies which will be needed to secure the fabric against further disintegration, to form a caretaker's room within the walls, etc., and towards maintenance. A building that was the handiwork of the fathers of modern English architecture and is so rich in literary and historical association can be confidently recommended to the generosity of readers. Subscriptions, however small, will be gratefully acknowledged by Professor A. E. Richardson, the Bartlett School of Architecture, University College, London.

Notes and Comments

Litter

One of the increasing evils of the present age is litter. The care-free custom of our populace in leaving the remains of *al fresco* meals to decorate the landscape has long exercised the minds and pens of newspaper correspondents, and has now earned the special distinction of broadcast admonitions. For while the visitors to beauty spots eat bananas and throw the skins about, they do not, like Kipling's tidy pachyderm of the great, grey, greasy Limpopo River, pick them up again. Perhaps it is because they have no trunk! That last word suggests a receptacle, and the want of a suitable receptacle is the primary cause for much of the litter one sees lying about. As one correspondent of the Press states, it is useless complaining about street litter so long as the authorities provide no receptacles for its disposal. And he complains that he has frequently carried waste-paper half a mile without finding any suitable place in which to deposit it. Yet there are numerous places in city thoroughfares, such as tram and omnibus stopping-places, where a box for the reception of used tickets might well be fixed. And that all people are not indifferent on the subject is evident to us from seeing the number of people who carefully drop empty match-boxes, cigarette cartons and other waste in such dust-bins as they find along the pavements of our London streets in the early morning. But the trouble is not confined to towns, for complaints are now becoming rife about the unsightly deposits of old cans, broken pottery and other refuse lying in ditches and corners about our villages. In such places the periodical call of the dustman is unknown, and with so much nowadays of their foodstuffs coming to them in tins, the inhabitants are hard put to it to dispose of the containers. But if the dust-cart system of the city is an economic impossibility in rural areas, there is point in the suggestion that each village should have an appointed "tip," such as a disused quarry, sand-pit or chalk pit, or some specially constructed enclosure, which the sanitary authority of the district might attend to, say, three or four times a year.

Steel-Framed Construction

The Institution of Structural Engineers have issued Part I of the Report of their Science Sectional Committee on Steelwork for Buildings, this dealing with loads and stresses in steel-framed multiple-storey structures. This sets out in practical form the methods and formulæ for calculations required in modern work. The price, 3s. 6d., strikes one as rather high for this modest pamphlet, but it must be remembered that it presents much practical knowledge in a condensed form, and will be reckoned a cheap investment by those who have to design this class of building.

The Foundling Hospital Site

Sir Johnston Forbes-Robertson takes advantage of the increasing and insistent call all over the country for open spaces, playgrounds and the preservation of beauty spots, to draw attention to the open space of the Foundling Hospital, now advertised for sale, and likely to be lost to London for ever unless immediate steps are taken to ensure its preservation. Several proposals for the utilisation of the site, without trenching on the open space or cutting down the trees have been put forward. A hostel for students from overseas at London University is one of them. The real difficulty is the need of money, and our millionaires have not, so far, shown themselves very helpful in the matter. We, therefore, make a perfectly practicable—and impracticable—suggestion. In addition to the Foundling Hospital open space, there is the Million Pound Fund for Playing Fields just inaugurated. And while our rich men do not appear very interested in either, they may be susceptible to other influences. Honours, for instance. Honours are conferred on men for doing their duty faithfully for supporting a political party, for being very successful in business; but less often for entirely disinterested gifts for the public weal. Why not, then, confer distinctions for large donations for the purchase of open spaces, the honour to be commensurate with the amount given. A Dukedom would not be too high an honour for the man who preserved the open space of the Foundling Hospital. How say you Mr. Prime Minister?

REGIONAL AND TOWN PLANNING IN THE DOMINIONS AND COLONIES

By H. V. LANCHESTER, F.R.I.B.A.

A general review of Regional and Town Planning in the Dominions and Colonies is, for many reasons, difficult to treat on a comparative basis. Not only does progress depend to a large extent on the urgency of the need, but it can be measured only in relation to a given starting point. Now in all the Dominions, owing to differences in the original type of settlement and in subsequent growth, there is a marked variation in the lines on which the more recent developments demanded formulation.

A comprehensive treatment of the subject on general lines being impracticable, the alternative remains of giving a very condensed resumé of the course that has been taken by the more important Dominions, Colonies and Protectorates in regard to town planning and the allied activities. We may begin our tour by crossing the Atlantic, continuing westward to complete the circuit of the "red patches" on our world map.

CANADA.

Canada took the most logical course in its preparation for regional planning by appointing a Commission to study its national resources. Unluckily its labours were brought to an end before completion, perhaps, indeed, owing to the fact that it became obvious that no competition was possible, but that such studies, to be of value, should be continuous. The work actually done was mainly directed towards agricultural and mineral developments, but these had definite bearing on the distribution of the population and the growth and character of communities.

Subsequently a number of ambitious schemes were prepared for the principal western cities by T. H. Lawson and others, which exhibit some very fine features based on the best standards of our time, but which have only materialised to a limited extent. Several new towns have been laid out on good lines, but in general, owing to too hurried operations, the town plans follow the rather primitive type of those

in the United States. The defects of these "checker-board" plans are now fully realised, and Canada is concerning itself with methods for ameliorating them, much of the activity among its experts being devoted to this aspect as well as to the improvement and more systematic treatment of the older cities.

As might be expected, the technique adopted in regard to zoning and other factors is more akin to that of the U.S.A. than of Europe, though Canadian architects and engineers are keeping themselves well informed as to modern practice generally, and making their own contributions towards it, so that we may confidently anticipate a high standard of practice.

AUSTRALIA.

Australia was somewhat more fortunate than Canada in the early planning of her larger cities. The site of Sydney suggested variety in the lay-out, and the original plan was on intelligent and liberal lines. True, this plan suffered from lapses in controls and supervision during the later half of the nineteenth century, but the defects are not irretrievable, and the great possibilities of its fine location are now being studied in a way that gives good hope for the future.

The planning of Melbourne was more mechanical, and though appropriate to the conditions of the moment, has not offered the same opportunities for development on effective lines. The alternation of 66-ft. and 33-ft. streets, suitable for a comparatively small area, needs special consideration from the traffic aspect when this first section has become the commercial centre, while most of the later extensions show but few instances of considered design.

Adelaide is the best designed, and Brisbane the worst, of the Australian capitals. The former started well with its encircling open belt and detached suburbs, and has maintained its good traditions by the preparation of a carefully considered and com-

prehensive scheme for the development and utilisation of the surrounding areas, extending to a distance of some 20 miles from the centre of the city. Of Brisbane the less said the better, but even here a movement is starting with the intention of remedying past mistakes and securing good development in the future.

A few words must be given to Australia's new Federal capital at Canberra. Political considerations limited the area within which a site was to be found, and although that selected is not a striking one, it has its good points from the point of view of the city planner. It was regrettable that the conditions of the competition for this plan were such as precluded British (including Australian) architects from taking part, but the fine plan submitted by W. B. Griffin, of Chicago, has met with general approval, and if its spacious extent becomes occupied by good buildings proportionate in scale, an impressive city should be the result.

NEW ZEALAND.

The Government here is actively pushing forward towards the efficient regulation of future developments, and last year brought in a Town Planning Bill more or less on the lines of the British Acts.

None of the New Zealand cities was originally laid out on very distinctive lines, but a number of them had a "town belt," or reserved open space, all round the area designed to be built on. In most cases this open space has been alienated and lost, but a few remnants remain, and these are now being worked into the new city schemes, which naturally demand adequate provision of this nature.

It may be opportune here to question the validity of this type of reservation; it looks attractive, but has the defect of interfering with the normal form of town growth, and as the ultimate size of any city can rarely be predicted accurately, it might be safer to allocate alternating radial areas to open space, rather than an encircling ring, as was done in the case of Adelaide, Dunedin, Christchurch and other towns.

FEDERATED MALAY STATES.

Town planning here has been for several years in the capable hands of Mr. C. C. Reade, who has, in addition to other work, prepared a comprehensive plan for the improvement and development of Kuala Lumpur, the official capital. Despite a certain amount of opposition, this plan is on the way towards realisation, and some of the works involved in course of construction.

Singapore, the largest city in this district, founded in 1819 by Sir Stamford Raffles, and at first well laid out under his direction, has since suffered much from unregulated growth, and is now in urgent need of the attentions of the town planner. Steps are being taken to remedy this deficiency, but nothing has so far been done that can adequately meet the requirements of a city with 400,000 inhabitants.

BURMA.

Rangoon possesses an efficient development committee, and its extensions are being carefully studied. The low-lying area near the river was laid out on rectangular lines, but as the town is now extending into the undulating ground to the northward, the new extensions no longer follow these lines, but those dictated by the contours and the direction of the main roads. The native Burmese tradition was a rectangular alignment with fairly wide roads, so that the older cities, such as Mandalay, make but little demand in the direction of replanning. Schemes of minor importance have been prepared for Maymyo, the Government hill station, and one or two other places.

INDIA.

In India the earlier efforts towards improvement were mainly due to the civilian officers in charge of the various districts, and originated out of the demands for improved sanitary conditions in order to cope with plague and other epidemic diseases. Subsequently Town Planning Acts were passed, often for specified towns, but Bombay Presidency has a general Act on English lines, and other provinces have passed Acts of various types.

Calcutta, Bombay, and a number of other cities possess active Improvement or Development Trusts financed by the Provincial Governments, but many of these have been seriously limited in their efforts during recent years by the difficulty in providing even small grants in aid, owing to the financial crisis through which India has lately been passing.

Municipal improvement has always been difficult in India owing to the disproportion between the standard of living and the cost of the ordinary civic amenities. The old rulers used frankly to make the agriculturalist pay for everything, but we, having abandoned this practice, find it difficult to provide for the maintenance of the city, let alone its improvement.

EAST AFRICA.

In East Africa, Kenya Colony has been coquetting with the problems of town planning for some years, but owing to financial stringency has hesitated to adopt any programme likely to be effective. A non-technical committee has been watching over Mombasa for the past six or seven years, but has done very little, while it is only more recently that at Nairobi a start has been made towards rectifying the confusion due to unregulated development.

In the group of islands comprised in the Zanzibar Protectorate there is only one city of substantial importance, that of Zanzibar, which has a population of some 40,000 and occupies an area rather more than a mile square, excluding the outlying villages. The original Arab city is closely built, with narrow and tortuous streets, while the adjacent Swahili quarter has grown up without regulation or order. The Government has been for some years alive to the need of improvement, and the officer in charge of the department, Mr. R. Crofton, has been very active in pushing on the more urgent items of a comprehensive improvement and development scheme which has been prepared for the city.

SOUTH AFRICA.

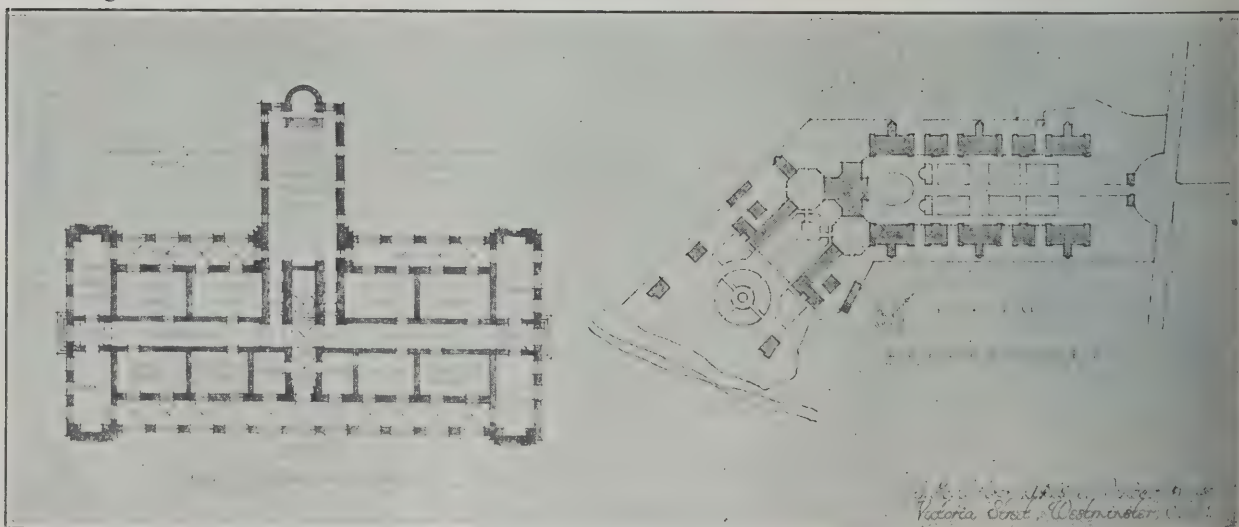

In the systematic regulation of regional and town planning South Africa lags behind the other Dominions. Probably its difficult racial problems have in a measure diverted attention from this as a national demand, for efforts have been made in Cape Town, Durban and elsewhere to improve the existing conditions and the lines of future development. Cape Town has at least one garden suburb, and in Durban some very handsome drives have been laid out. There is, however, an increasing body of opinion, both among technicians and the public, in favour of more study being given to the future development of the towns and their surroundings, so that this will probably make itself felt before long.

Throughout all the Dominions, owing to the more rapid development than in the Home Countries especially in commercial activities, there is an urgent need of co-ordination between the operations of various bodies, such as the Port and Railway Authorities and the Civic Councils. Desirable as this is in all cases, it is especially so in rapidly growing communities, a fact that hardly seems to have yet secured due recognition.

The Perils of the Parson

Our recent note on "Care of Cathedrals," contrasting, in building matters, the liberty allowed to Deans and Chapters with the severe restrictions imposed upon parochial incumbents, has received apt illustration. For even as the issue reached the hands of readers, the Ely Consistory Court was hearing an application by the Vicar and Churchwardens of Ickleton for a faculty to recast six of the church bells, an application that was in the nature of an indemnifi-

cation, since the recasting had already been done. In the event, the Vicar was severely censured and reported to his Bishop, and the churchwardens were suspended from office. One must admit that the action of the Vicar and his coadjutors was "most irregular and improper," and that it was rank unwisdom to have eighteenth-century bells recast on the mere *ipse dixit* of a firm of bell founders. But the severity of the Chancellor's reproof and judgment could hardly have been greater if the Vicar had carried out the most vandalistic alterations to the fabric in his charge.

MEMORANDA

I.—White Portland Cement

Although white Portland cement has now been on the market for several years, the full range of its uses has still to be appreciated. It is not only in the production of white decorative effects that this material is employed, for a pure white finish is rarely in demand. Its function is rather to provide for a cement, with all the good qualities of Portland cement, which can be used where pure shades of colour are desired, more especially those shades imparted to a cement finish by the use of coloured aggregates such as sand and spar. A certain amount of colouring can, of course, be obtained by using ordinary Portland cement, but that greyiness with which we are familiar in masses of concrete is considerably "heavier" than is apparent to the eye. Where the delicate shades of coloured aggregates are in question, the attendant disadvantages of this greyiness cannot be disregarded, for even where the aggregate has been exposed by scrubbing off the outer skin of cement its true colour may be "tinged" by the actual particles of cement which bind the aggregate together.

"WHITE" CEMENT AND "GREY" CEMENT

White Portland cement and ordinary grey Portland cement are identical except for their difference in colour. This difference is obtained by the use of a refined process of manufacture in which special attention is given to the selection of the raw materials. The clays used, for example, are selected for their freedom from iron, whilst the coal used in firing the cement kilns is chosen for its low carbon contents, iron oxide and carbonaceous matter being the chief cause of the greyiness of ordinary Portland cement. Actually, white Portland cement is also a little more finely ground than the ordinary grey product, and in practice it gives a somewhat higher tensile strength.

At present there are no cement works in this country actually producing the white product. It is from the United States that the bulk of the world's supply is derived, two brands ("Atlas White" and "Medusa") being available to the English market. In contrast to ordinary Portland cement, these "white" grades are packed in barrels instead of bags, each containing 4 cubic ft., or approximately 376 lbs. net weight.

In general use white Portland cement serves as a "finish." It is a Portland cement which complies with the requirements of the British Standard Specification, and has the added advantage of being white and non-staining. On account of this whiteness it can be tinted by selected aggregates and by the use of mineral oxides, and can therefore be used wherever "colour" is desired in surface renderings, as a pointing where pure white cement mortar is required to contrast with the colour of brick or terra-cotta, or in the setting of fine textured stone. It is in the latter case that its non-staining qualities are a matter of importance, for mortar made with ordinary grey Portland cement will invariably produce discoloration in many of our building stones.

Applied as a rendering or "stucco," white Portland cement need only be used in the finishing coats. Here it serves in the rôle of a neutral colour base from which all shades of colour are possible.

APPLICATION AS A RENDERING.

With three-coat work each coat, of course, has its own particular function. Recapitulating our present-day practice, the first coat, made with a mixture of one part of ordinary grey Portland cement to three parts of sharp, washed building sand, is applied to form a bond between the wall surfaces and the body of the stucco. The thickness of this "base" coat should average $\frac{1}{4}$ in. The second coat, also of grey cement and washed sand, merely serves to "even up" the surface for the finish coat. Forming the body of the stucco, it fills the hollows and flattens out the humps of the first coat, and for this reason an average thickness of $\frac{3}{8}$ to $\frac{1}{2}$ in. is necessary. Upon this is applied the third, or "finish" coat, made with white cement, and containing not less than three parts of fine aggregate to one part of cement. The second coat is usually applied 24 hours after the base coat, but an interval of at least seven or eight days is allowed to elapse between the application of the second coat and the finish coat, this delay being necessary to enable the body of the stucco to obtain its initial shrinkage. Prior to the application of the finish coat, however, the wall surface must be thoroughly saturated with water from a hose, otherwise there will be a tendency for the second coat to absorb water from the finish coat, which should retain its full plasticity for half-an-hour.

The mixture of cement and aggregate used should be an

intimate one, in which the individual particles of the aggregate are bound together by the cement, but unless clean sharp aggregates are used this will be almost impossible to attain. Even so, the finished surface can be ruined by excessive trowelling, in that this tends to pull the cement to the surface away from the coarser aggregate, producing a surface which will map-crack and craze like "neat" cement.

THE SELECTION OF THE AGGREGATE.

The aggregate used should be of a hard, silicious nature, free from loam (in the case of sand) or fine flour-like dust (in the case of crushed stone). Each grain and particle should, moreover, be sharp; the bulk having a resemblance to granulated sugar. Silver sands and Portland stone dust make bad aggregates. Dusty grades of crushed marble should also be avoided, for they are generally the cause of unsightly cracking or of non-coherence between the cement and the aggregate. A good aggregate will always allow the use of a 1 to 3 mix for the finish coat, which should never be less than $\frac{1}{4}$ in. and never more than $\frac{1}{2}$ in. in thickness. The thickness most suitable for the production of texture can be taken as $\frac{1}{4}$ in. to $\frac{3}{8}$ in. At a thickness of $\frac{1}{4}$ in. one barrel of white cement (using a 1 to 3 mix) will cover 50 square yards of wall surface; at $\frac{3}{8}$ in., one barrel will cover 40 sq. yds.

A Dado of Three-ply faced with Oregon Pine, laid with Butt Joints and nailed to Rough Plaster, to Breeze or to Grounds.

BERWICK BRIDGE: GENERAL VIEW, LOOKING UP-STREAM TAKEN FROM NORTH SIDE OF RIVER, SHOWING THE OLD BRIDGE IN FOREGROUND.

The New Border Bridge

As the accompanying illustrations show, very considerable progress has been made with the third link, between England and Scotland, over the Tweed at Berwick. The new Border Bridge, which it is hoped to complete by the end of this year, lies between the two existing bridges, the high viaduct, built by Robert Stephenson to carry the North-Eastern Railway, on the west, and the 17th century masonry bridge, which lies to the east. The latter interesting example of the work of the old bridge builders, with its 15 arches, total length of 924 feet and width of only 17 feet, has carried the main highway to the North since 1634; but will be superseded in this duty by the new bridge, when completed, and will then serve as a purely local traffic link between the towns of Berwick and Tweedmouth.

The new structure, which is being erected for the Northumberland County Council, has a total length of 1,405 ft., of which the southern and northern approaches take up 199 ft. and 144 ft. 6 in. respectively. The bridge proper, 1,061 ft. 6 in. long, has four arches, the spans increasing progressively from the southern to the northern shore, these being 167 ft., 248 ft., 285 ft., and 361 ft. 6 in., measured centre to centre of the piers. The width is 46 ft. between parapets, or nearly $2\frac{3}{4}$ times the width of the old bridge, and will provide generously for the increasing road traffic to which the narrowness of the existing road bridge has proved a serious hindrance in recent years. The erection of the new bridge will also serve to get rid of the present steep ascent from the old bridge into the town of Berwick, the existing Newcastle Road being diverted along a new approach road and leading by a slight incline on to the new bridge, over which a gradient of 1 in 51 is maintained. It continues, then, straight into Mary Gate, the principal street of Berwick, an arrangement that involves the demolition of a good deal of slum property in the town.

From the constructional point of view, the new bridge is of particular interest as being constructed entirely in reinforced concrete, and including the largest span carried out in that material in this country. It is this span of 361 ft., on the Berwick side, providing a clear fairway under of 47 ft. at high water, which is now in progress. The arch ribs of all the spans are hollow, so as to secure maximum strength with a minimum amount of material, also saving dead weight and effecting considerable economies. The gracefulness of the lines of the bridge will be apparent from the photographic views, and it should prove a worthy addition to the many achievements in bridge building for which the Briton has a long-standing reputation.

The engineers are Messrs. L. G. Mouchel & Partners, acting in consultation with the Chief Road Engineer of the Ministry of Transport (which has made a considerable grant towards the cost, estimated at £122,900), and with Mr. J. A. Bean, the County Surveyor of Northumberland. The contractors are Messrs. Holloway Bros. (London), Ltd., who started the preliminary works in December, 1924, and the actual excavation work early in the following year.

The Surrey County Council approved, last week, the second of three schemes prepared for improved bridge facilities over the Thames at Hampton Court. Under this scheme, a new bridge would be built lower down the river, with an entirely new road to connect up with the Kingston by-pass road where it joins the Portsmouth Road. This will give an improved approach to Hampton Court Station, be more convenient for traffic from the north desiring to pass through East Molesey, and for traffic from Hurst Park Racecourse wishing to use the Kingston by-pass road. It would avoid high and ugly embankments, and would not interfere with the grounds of Hampton Court Palace. The estimated cost of the scheme is £400,000.

BERWICK BRIDGE: GENERAL VIEW, LOOKING UP-STREAM, FROM EAST SIDE.
TAKEN FROM SOUTH SIDE OF RIVER.

Coming Events

June 25.—Free lecture, in connection with the Centenary celebrations at University College, London, on "The Development of Bloomsbury," by Professor Adshead.

The Foord Almshouses at Rochester, designed by Mr. E. Guy Dawber, A.R.A., are to be formally opened by Prince and Princess Arthur of Connaught on June 28.

June 28-July 1.—Annual Conference and Second Exhibition of Quarrying Plant, Machinery, etc., at Harrogate.

June 30.—Laying of commemoration stone of the new Royal Westminster Ophthalmic Hospital, Broad

Street, Bloomsbury, W.C., by H.R.H. the Duke of Connaught.

Institution of Municipal and County Engineers (Yorkshire District), and the Town Planning Institute (North of England Division).—July 1.—Joint Meeting at Doncaster.

July 11 to 16.—The Royal Sanitary Institute. 38th Congress and Health Exhibition will be held at Hastings.

July 14.—Unveiling of the Scottish National War Memorial at Edinburgh Castle by the Prince of Wales.

July 16.—Institution of Municipal and County Engineers. Eastern District Meeting at Cambridge.

The King and Queen will visit Liverpool next month to open the Gladstone Dock.

Professional Societies

The New R.I.B.A. Council

The result of the election for the Council was announced at the meeting held on Monday last.

COUNCIL.

President: Walter John Tapper, A.R.A.

Vice-Presidents: Henry Philip Burke Downing, Henry Vaughan Lanchester, Percy Edward Thomas (Cardiff), Maurice Everett Webb.

Honorary Secretary: Edwin Stanley Hall.

Members of Council: Henry Victor Ashley, Robert Atkinson, Sir Herbert Baker, A.R.A., Walter Cave, Major Hubert Christian Corlette, Arthur Keen.

Associate Members of Council: Harold Chalton Bradshaw, Charles Cowles-Voysey, Michael Theodore Waterhouse.

Licentiate Members of Council: Arthur Baldwin Hayward, Captain Augustus Seymour Reeves.

Past Presidents: Edward Guy Dawber, A.R.A., John Alfred Gotch (Kettering).

REPRESENTATIVES OF ALLIED SOCIETIES.

Northern Province of England: J. M. Dossor (York and East Yorks Architectural Society), F. E. P. Edwards (Sheffield, South Yorkshire and District Society of Architects and Surveyors), H. S. Fairhurst (Manchester Society of Architects), E. B. Kirby (Liverpool Architectural Society), T. B. Wilson (Leeds and West Yorkshire Architectural Society). One representative to be appointed by the Northern Architectural Association.

Midland Province of England: E. T. Allecock (Leicester and Leicestershire Society of Architects), E. C. Bewlay (Birmingham Architectural Association), E. T. Boardman (Norfolk and Norwich Association of Architects), J. W. Fisher (Northamptonshire Association of Architects), J. Woollatt (Nottingham and Derby Architectural Society).

Southern Province of England: A. C. A. Norman (Devon and Cornwall Architectural Society), T. Overbury (Wessex Society of Architects), J. A. Smith (Hampshire and Isle of Wight Architectural Association). One representative to be appointed by the Berks, Bucks and Oxon Architectural Association.

Allied Societies in Scotland: T. M. Cappon (Dundee), J. K. Hunter (Glasgow), D. F. MacLennan (Edinburgh), G. P. K. Young (Perth).

South Wales Institute of Architects: C. S. Thomas (Swansea).

Allied Societies in Ireland: Professor R. M. Butler (Royal Institute of the Architects of Ireland), E. R. Kennedy (Ulster Society of Architects).

Architectural Association: G. H. Jenkins.

Association of Architects, Surveyors and Technical Assistants: W. H. Hamlyn.

The Northern Architectural Association

The Northern Architectural Association, at its annual meeting at Higham Place, Newcastle, was able to report a successful year.

For the first time, the membership had reached 300.

By the terms of the will of Mr. William Glover, the Association benefits by the receipt of a further sum of £1,000 in Consols.

The election of officers resulted:—

President, Mr. J. H. Martindale (Carlisle); hon. secretary, Mr. R. N. H. McKellar (Newcastle); hon. treasurer, Mr. J. T. Cackett (Newcastle); hon. librarian, Mr. G. E. Charlewood (Newcastle); Council, Messrs. G. T. Brown (Sunderland), Geo. H. Gray (North Shields), T. Harrison (Newcastle), J. W. Hays (Wingate), P. C. Newcombe (Newcastle), F. N. Weightman (Newcastle). Associate members: Messrs. J. F. H. Checkley (North Shields), J. R. A. Macdonald (Jarrow), and S. C. Punchard (Newcastle). "Glover" trustees, Messrs. A. K. Tasker and R. N. H. MacKellar.

Building News in Parliament

WESTMINSTER, Wednesday, June 22.

It was disclosed by the Minister of Agriculture, in his capacity of Crown Land Commissioner, that the amount received by the Crown in the financial year ended March 31 (1927, in respect of ground rents in Regent Street, reserved under the new leases, was £345,405. He was asked by Sir R. Thomas whether the buildings erected on these lands had increased in rental value 1,700 per cent. since the war, and whether he considered that to be due to the increase in the ground rents. The Minister refused to be drawn into discussion, and merely stated that the increase was due to the market value of the land, a fact in which he saw no cause for regret, as the public were getting the sum mentioned out of it.

An effort is now being made by the Minister of Health to stimulate local authorities to adopt the Act which was passed last year to bring about the reconditioning of rural houses occupied by agricultural workers. Already some forty county authorities have adopted the Act in areas as far apart as Westmorland and Wiltshire, Cumberland and Cornwall. Special interest appears to have been aroused in the movement in Devon and Dorset. The Act has been adopted also in the greater part of rural Yorkshire, in several Welsh counties, in Gloucester, Hereford and Kent, Essex, Sussex and Surrey.

Special provision was made in the Act for the protection of rural cottages which have unique architectural or antiquarian features. The houses in all cases will be brought into line with modern sanitary requirements and conceptions of comfort, while preserving the structures substantially. The inducement held out to landlords to make the requisite improvements take the form of local and national grants of moderate amount, and the Minister of Health has more than once expressed his confidence that the Act will effect, at very little cost, a substantial measure of improvement in rural housing.

The Minister of Health was asked whether it would not be possible to supplement the information which is supplied in the "Labour Gazette" as to building plans approved in certain areas, by an annual statement of the total value of plans passed by local authorities in the whole of England and Wales. Mr. Chamberlain, in reply, pointed out that, in the interests of economy, he could not ask the local authorities to incur the expense necessary in collecting that information, and he must be content with the large and representative samples provided by the present collection of returns from 146 of the principal towns, covering over two-fifths of Great Britain, outside London.

New Reptile House, Zoological Gardens

The new Reptile House at the Zoological Gardens, London, was opened last week. The exterior of the building was designed by Mr. E. Guy Dawber, A.R.A., the entrance door being enriched by sculptures of snakes and other reptiles, studied from life, and executed by Mr. George Alexander. The whole of the interior arrangements have been devised by Miss Joan B. Proctor, the Curator of the Reptiles. By the use of glass admitting ultra-violet rays, the installation of powerful electric lights to simulate sunlight where required, special heating arrangements, and the building up of scenic surroundings, including actual rock-work, pools, and the introduction of tropical plants and vegetation, pieced out by painted backgrounds, every endeavour has been made to create the atmosphere of natural habitats both for the spectators and the creatures themselves. In regard to the latter, the results are reported to be so satisfactory that they are displaying a certain liveliness, very different to the torpid lethargy which was their characteristic in their old quarters.

Fig. 1.—THE BULL-RING, BARCELONA: THE TOWERS WITH THEIR BLUE AND WHITE TILED CUPOLAS.

THE ARCHITECTURE OF A SPANISH BULL-RING

By HOWARD ROBERTSON, F.R.I.B.A., S.A.D.G. Photographs by F. R. YERBURY.

Whatever feelings we may have with regards to bull-fights as a national sport, there can be no doubt that the design of the bull-ring offers a magnificent architectural opportunity. Any arena or amphitheatre on a similar scale would, of course, do the same; but it is rare to find the opportunity for a building which has something of the magnificence of a huge stadium yet which has not altogether lost the intimacy of the open-air theatre. In addition, the prestige of the bull-fight as a spectacle makes legitimate a high degree of pomp and festivity in the design of the building, and the architect finds himself in the happy position of creating a piece of architecture which will always be looked upon by the public when it is in vogue, and in day humour, ready to applaud everything spectacular, and encouraged by that infinitely precious sensation of being-about-to-have-a-good-time. As a national institution in Spain, the bull-fight occupies a place of importance similar to that of our football finals, only more so. It is true that on Cup Finals in London one may notice a certain activity in

the direction of charrs-à-bancs and rosettes, and perhaps there is congestion in Twickenham or Wembley. But this only lasts for a few hours, or at most a day; whereas in Spain, when an important bull fight is on hand, everything seems to stop functioning for about three days, business is disorganised, and the traveller who is trying to forget that such a sport exists has no refuge but to try—if he can find a means of getting to the station—to escape over the border into France.

Bull fights were originally a pastime of the Spanish aristocracy, and were truly sporting in that the bull fighter was on horseback and armed only with a lance. On the whole, the chances of the bull were fairly good and the "caballero" was frequently unhorsed and injured. But since the seventeenth century the present system of conducting the fight has been in vogue, and there is very little chance that any bull will leave the establishment in the form of anything but potential butchers' meat.

The first public arena for bull fighting was built in Madrid in 1750, and it whetted the Spanish appetite

Fig. 2.—THE BULL-RING, BARCELONA: THE REAR ELEVATION, A SPLENDID MASS OF BRICKWORK.

to such an extent that at least 200 public "Plazas de Toros" have been built since. The fights generally take place on feast days and public holidays; in Barcelona there is a fight on practically every Sunday and holiday during the six summer months.

The bull-ring in Barcelona is one of the newest and most interesting in Spain. It was completed in 1916 to replace an older structure, and it has seating accommodation for over 20,000 spectators.

The general form, like most of the bull-rings, is that of a Roman amphitheatre. The plan is nearly always of the same type, and provides a central arena, which is surrounded by a wooden barrier about 5 ft. high, behind which runs a narrow passage; the idea of this is to provide a means of escape for the "banderilleros" (who's job it is to excite the bull by sticking him with darts) when the attentions of the infuriated animal become too pressing. If anyone cares to study methods of clearing a 5-ft. fence at speed while carrying a parcel in the right hand, he cannot do better than attend a bull fight patronised by a really snorty bull.

Beyond this service passage are open seats, and further beyond these are covered seats and sometimes boxes, which are occupied by the rank and fashion. Theoretically, the plan of the seating accommodation should be asymmetrical, as by far the greater bulk of the spectators prefer to sit on the shady side.

The Barcelona ring follows the accepted convention in its planning arrangements. It is circular in form, and the amphitheatre seating is surrounded by gallery circulations, from which access is had by staircases and "vomitories" to various parts of the house. The staircases certainly do not conform to L.C.C. restrictions, but the architect has managed to conceive some of them with dramatic and spectacular effect, as our illustrations show.

An appreciation of dramatic possibilities is, in fact, an outstanding impression of the Barcelona bull-ring, from the inside and outside alike. The exterior is by no means fantastic; indeed, judged by the standards

of some of the modern work in Barcelona, it represents the high-water mark of sobriety; but it is certainly gay in colouring, and its massing is bold and assertive, with an obvious enjoyment of movement and rhythm in the handling of the main masses and the fenestration. The whole of the exterior, in particular, has a fine full-blooded vigour; one feels that the architect has put himself into holiday mood in this design, and is himself a keen judge of the sort of spirit which the architecture of a bull-ring should try to induce in a spectator who is stopping work for three days in honour of a "corrida."

There is a fine sense of scale in the great vertical bays and buttresses which rise unbroken from base to parapet, and the fenestration is well contrasted, with small points of void which increase the apparent vastness of the main arcading. The entrance, too, is dramatic, placed on the corner at the junction of two main boulevards, flanked by two great towers whose cupolas are gaudy with a pattern of blue and white mosaic. The same material is used as insets in fields of plaster on the entrance front, but this decoration is a trifle overdone, with the result, so common in buildings all over the world, that the finest effect of all is obtained in the rear elevation, which is really in its own characteristic way a very fine piece of architectural design.

There is originality and power in a good deal of the detail, which is stark and simple as befits a great arena which is framed in such strong, plain materials as brick and steel and concrete. Particularly fine are the great wooden gates, with their rhythmical lines of lattice framing, set on the inside face of deep reveals, which lose nothing through the intense southern sunlight and shadow. There is a modern feeling running through the handling of these gates, as well as in the modelling of the brick base and the corbelled impost to the pointed arches, while the ironwork to the staircase balustrades have the broad richness of Spanish metalwork without being too tricky or over-designed for the material.

FIG. 3.—THE BULL-RING, BARCELONA: GENERAL VIEW OF THE INTERIOR.

The public galleries are spacious and lofty, and an excellent effect is gained by the steel and brick arched ceiling of the type so popular on the Continent, no attempt being made to obtain design interest other than through the stressing of the great circular sweep which arises from the plan. There is nothing Roman in the treatment, but the bigness of Roman work is present in the spirit.

The interest of the interior is focussed on the sanded arena and the tiers of spectators in multi-coloured attire. For there are never any empty seats for the corridas, and if the spectacle consisted of nothing more than the contrast of the women in their gorgeous Spanish shawls and mantillas, set in relief by the black clothes of their male escorts, there would be nothing in a bull-fight beyond an artistic thrill. There is thrill of another kind, however, when the battle is engaged, and to the uninitiated it is so unpleasant that the claims of architecture can scarcely be accorded a due attention.

The bull, and the unfortunate horses, are not always, however, the only victims of these contests, and the matadors follow a calling the perils of which are represented by the fees they earn, for it is quite common for a matador of renown to earn as much as three or four hundred pounds in an afternoon. It is the sword which gives the *coup de grâce*, but failures to effect a kill entail a warning from the authorities, and after three such warnings the erstwhile champion loses his rank as matador—if he is fortunate enough to escape with his life.

If, however, the architect traveller wishes to see a Spanish bull-fight, he can be assured of well satisfying his curiosity in Barcelona. And, which is almost as important, he will find in the Plaza de Toros not a little architectural inspiration.

Competition Result

Leith Town Hall Designs

Sir George Washington Browne, President, R.S.A., has issued his report as assessor in the competition for designs for Leith's new Town Hall and Library. Forty-one designs were submitted, and awards are as follows: First premium, Messrs. Bradshaw, Gass & Hope, Bolton; second premium, Messrs. Collett & Hamp, London; 3, Mr. Hendry Boddington, London; 4, Mr. James B. Dunn, 14 Frederick Street, Edinburgh, in collaboration with Mr. Herbert H. Wigglesworth, London. The competitors were restricted to a maximum cost of £70,000.

Competitions Open

Closing Date, June 30.

Grammar School, Bradford, for 1,000 boys. Premiums, £300, £200 and £100. Assessor, Mr. Arnold Mitchell, F.R.I.B.A. Particulars, Mr. W. Brear, Secretary, Grammar School, Bradford, Yorks. Deposit £1 1s.

Closing Date, August 23.

University Buildings, Western Australia. To cost £150,000. Premiums, £400, £300 and £200. Assessors, Prof. Leslie Wilkinson, F.R.I.B.A., Mr. A. R. L. Wright, L.R.I.B.A., President Royal Institute of Architects of Western Australia. Particulars, Agent-General for Western Australia, 115-116 Strand, W.C.2.

A further gift of £40,000 to Edinburgh University by Mr. Thomas Cowan, the shipowner, of Leith, is designed to assist the scheme for establishing a residential house for male students at the university. Mr. Cowan's previous gifts to the university for the same purpose amount to £30,000.

Book Notices

The Water Supply of Buildings and Rural Communities. By Walter S. L. Clevendon. (New York: D. Van Nostrand Co.). \$2.50.

This volume is essentially a compendium of useful information upon the engineering details of "supply and consumption"—methods of pumping, service mains, cocks, water meters, storage tanks, etc.—supplemented by diagrams, tables and other data. Some practical suggestions upon "layout and installation" form the subject of one of the chapters, whilst another deals with "maintenance."

Advanced Constructive Geometry. By J. F. Dowsett. (Oxford University Press. London: Humphrey Milford). 25s. net.

This book goes very thoroughly into various geometrical problems which are directly or indirectly connected with building construction (*e.g.*, cylindrical vaulting, domes and niches, intersected mouldings, handrailing, etc.), and architectural draughtsmanship (projection of shadows and perspective). The subject matter throughout is presented in an unconventional form, its direct usefulness having been the chief aim of the author.

Ideas and Studies in Stencilling and Decorating. By A. Desaint. (Charles Griffin & Co.). 15s. net.

As its title might imply, this book comprises a series of plates giving suggestions for the happy combination of colour and ornament. Forty plates are included, covering a wide range of studies suitable for friezes, dados, panels and ceilings, the actual plates being reproduced in black and white, and keyed for two alternative colour schemes.

Modern Steelwork. Edited by Ernest Fiander Etchells. (Nash & Alexander, Ltd., 103 Kingsway, W.C.2). 5s. net.

This book is a review of modern practice in the application of steelwork to bridges and building. It contains a number of semi-technical articles by architects and consulting engineers, including Dr. Oscar Faber, Mr. J. A. Sharman, Mr. T. S. Tair, and Mr. Ewart S. Andrews, on various aspects of the problem, together with illustrations and descriptions of modern contracts.

THE HOUSE AND LODGE AS SEEN FROM THE ADJACENT HILLSIDE

THE ENTRANCE.

"HELLENS," ILSINGTON, SOUTH DEVON.
T. H. LYON, F.R.I.B.A., Architect.

"Hellels" (the ancient name of the field in which it stands) is situated on the borderland of Dartmoor, on the side most exposed to the south-westerly gales. Hence the one-storey treatment with very deep eaves and buttressed corners. The walls are built in local stone, cement rendered and rough cast. Delabole random slates were used for the roofing. When the house was erected, arrangements were made for possible future rooms in the roof which the first owner did not require. Unfortunately, the present elevation has suffered by reason of additions of an unsympathetic character.

Messrs. Mills & Sons, of Newton Abbot, were the contractors.

THE SOUTH FRONT.

HELLENS.

"HELLENS," ILSINGTON, SOUTH DEVON.
T. H. LYON, F.R.I.B.A., Architect.

MODERN PRACTICE

I.—Fireproofing Thatch

The fireproofing agents which are commonly used for timber cannot be applied to thatch, for most of these chemical products are soluble in water and would be easily leached out by the rain. The exposed position which it necessarily occupies as a roofing material is, however, not the only factor which has to be taken into consideration in selecting a suitable method of treatment, for thatch has a certain texture which would be marred by the application of a coat of fire-resisting paint.

To overcome these difficulties an insoluble fireproofing body must be formed within the cell walls of the thatch, where it will not only retain its fire-resisting qualities under all conditions of weather, but will at the same time give little or no indication of its presence in the treated thatch. "Alumina" is a material which fulfils these requirements. This "alumina" is a metallic oxide, but without going into the study of chemistry we may regard it as "a kind of lime" which is quite insoluble in water.

The materials used for treatment are "sodium aluminate" and "sodium bicarbonate." The latter is quite a common commodity used in the household for culinary operations, and is often referred to as "bicarbonate of soda"; sodium aluminate, however, must be obtained from a wholesale chemical merchant or by placing an order with the local chemist. It is a white "salt like" solid, which is readily soluble in water, and in a commercial form costs about 1s. 10d. per lb. for quantities of 14 to 28 lbs.

Treatment is carried out by first soaking the thatch in a solution of the sodium aluminate, allowing from fifteen to twenty minutes' immersion, so that the solution is able to permeate well into the cell walls of each individual reed or straw. The thatch is then lightly rinsed in clean water and transferred to a solution of the sodium bicarbonate, allowing the same period of immersion as before. The sodium aluminate solution must be freshly prepared and made up to a density of 1.13 for reeds, or 1.15 for straw, as tested with the aid of a hydrometer. The strength specified is important and should be carefully checked (the extra expense involved upon the purchase of a suitable hydrometer need not exceed 4 to 5 shillings). The solution of sodium bicarbonate, however, may be used at a specific gravity of 1.13 for both reeds and straw. Watertight tubs can, of course, be used as receptacles in which to soak the thatch.

The material thus impregnated must now be rinsed in clean water and subjected to the action of steam, in order to decompose the chemicals which have been absorbed, with the production of the insoluble "alumina." This steaming may be conveniently carried out by spreading the thatch on boards laid on the ground and playing upon it for fifteen to twenty minutes with steam from a hose, or by placing it in batches in an old galvanised tank to which a

steam pipe is connected. The thatch is then spread out to dry and is ready for laying.

In this process the provision of an adequate supply of steam, however, is the chief difficulty associated with the work, but high-pressure steam is not a necessity. It is therefore advisable to hire a small vertical boiler where large quantities of material have to be treated, although for a roof of, say, 1,200 to 1,600 feet a coke-fired boiler of the type used for central heating can be pressed into service. If facilities can be obtained for doing the work at some factory where a proper steam plant is already installed so much the better, for the steam supply is then continuously available, and being at a reasonably high pressure five minutes' exposure would be sufficient for each batch of thatching material.

In cases where the thatch has to be treated *in situ*, the respective solutions of sodium aluminate and sodium bicarbonate may be applied by spraying with the aid of a large garden syringe, working over the roof in sections so that sufficient time can be allowed for "soaking in" between each successive application. A spell of dry weather must, of course, be selected for this work, otherwise the salts may be washed away almost as quickly as applied. Five good drenchings with the sodium aluminate, followed by one application of clean water to rinse the surface of the thatch, and then five applications of the sodium bicarbonate solution will suffice to give a good factor of fire resistance after the final treatment with steam, which, in this case, must be done with whatever facilities are at hand to give the necessary supply.

As an alternative method of treatment, which does not necessitate the use of a supply of steam, the thatch may be impregnated with a solution of common salt and "sal-ammoniac." A bath of suitable strength may be prepared by dissolving 2 lb. of each of these salts to every gallon of water used, and from 15 to 20 minutes is sufficient for the period of immersion. The thatch is then air dried, without any intermediate rinsing, and placed in a second bath containing river silt suspended in water, using one bucket of silt or mud to three or four buckets of water. In this way the solutions which have been absorbed are "fixed" within the cell walls of the reeds or straw.

After being spread out and exposed to the sun, the thatch is then dipped into powdered asbestos which has been mixed with water to the consistency of a pulp. In this case it need only be dipped momentarily, so as to obtain a thin coat of the asbestos; it is then dried a third time and is ready for laying. From some inobscure reason the asbestos thus applied shows no tendency to scale under the influence of the weather, and neither does it alter the general appearance of the thatch.

MINIATURE FLATS

An Interesting Post-War Development

The modern flat is said to owe its germinal idea to the sixteenth century buildings of the Inns of Court, where the benchers' chambers consisted of a bedroom, a separate room for the conduct of business, and a passage or corridor affording dark, and probably quite inadequate, accommodation for a clerk or servant. It is an idle speculation, perhaps, but there is no doubt that in this primitive arrangement of rooms, with a common entrance and staircase, we have the essential features of the "flat" as we know it to-day. The curious thing is, however, that there appears to have been no continuous development in the design of flats, such as will be found in the evolution of the small house or cottage, and it is scarcely an exaggeration to say that the flat proper was comparatively unknown in this country until some forty or fifty years ago, and even then it was confined to a few flats-de-luxe for the wealthy, and some hideously ugly "Industrial Dwellings" for the labouring classes. During the last twenty years or so, and particularly since the war, the small flat has found considerable favour with people of modest income, having neither the means to "run" a house nor the inclination to spend their lives in the cheerless atmosphere of "furnished apartments" or boarding houses. That housing authorities are alive to this development can be seen from the provision made, in many town and urban housing schemes, for a certain proportion of flat dwellings to be erected along with the normal cottage types. Examples that can be called to mind are the L.C.C. schemes at Tottenham and elsewhere, some excellently designed flats erected by H.M. Office of Works for the Bethnal Green Council, the fine work of Messrs. Adshead and Ramsey at Kennington, and some particularly successful ex-

amples carried out by the Liverpool Corporation.

Unfortunately, however, the various Housing Acts that have been passed since the war, including the magnificent but ill-starred Addison Act, have been concerned, without exception, about the provision of homes for families, and, while none can cavil at this, it has imposed a severe handicap on the thousands of childless couples and single persons of either sex who, although willing and able to pay a reasonable rent for accommodation adjusted to their particular needs, have been debarred from doing so by the lack of suitable buildings and, even more, by the rapacity of more fortunate householders, who, under the shelter of the Rent Restriction Act, make a handsome profit by letting one or more rooms at extortionate rentals. It was to meet this need, in so far as single or widowed women were concerned, that the United Women's Homes Association was launched in March, 1925, and its success has been so emphatic that out of this parent association a subsidiary body known as the United Citizens' Homes Association has been formed to extend the same facilities to men and married couples.

An offshoot of the United Women's Insurance Society, the United Women's Homes Association is a Public Utility Society registered under the provisions of the Industrial and Provident Societies Act for the express purpose of providing flats, houses or rooms for letting to its members. That the association is very much alive to the importance of good building is evidenced by the appointment of Mr. Barry Parker, F.R.I.B.A., M.T.P.I., as consulting architect.

It will be at once asked how, if it is admittedly impossible at the present time to build working-class houses for letting with any prospect of profit, such a

society as this can be sound financially. The answer is that while the association is certainly not a philanthropic body, neither is its first concern one of profits. It is an entirely self-supporting organisation, and its capital is raised partly by the shares which all members are required to hold, partly by the issue of loan stock affording a safe and good yielding investment for savings, partly by subsidies under the Housing Acts, and partly by loans from the Government, L.C.C., and other public authorities or private persons on mortgage.

The activities of the association comprise not only the building of new flats of various types, but the conversion of suitable large houses for the same purpose, and quite a number of these conversions have been carried out in the Bayswater and Kensington districts of London and in the provinces. Interesting, however, as this "conversion" work is, the chief object here is to give some account of the new work that is being carried out, and examples of typical blocks of flats now in course of erection at Hammersmith and St. Albans, and a completed scheme at Ashtead, in Surrey, will be described in detail.

It should be noted, however, that finality has by no means been reached in the solution of this particular problem. No attempt is made to repeat, *ad nauseum*, a type of flat that has been found to satisfy the requirements of one particular site; and constant endeavour is made to evolve new designs of a more economical and attractive type. Mr. Allan Gordon, the managing director of the association, is at present touring the industrial centres of Holland, Germany and Austria in order to gain first-hand information of the methods that are being adopted in these countries to grapple with the self-same problem.

As a result of two years' continuous building, it has been found that the greatest demand is for the type popularly known as the "one-room flat." In its essentials this comprises a living-room with two curtained-off alcoves or bays, one large enough for a single bed and the other a work recess of sufficient size for cooking and washing, etc., to be carried out without mess or untidiness in the living-room proper. Many variations of this arrangement have been evolved, and illustrations of three typical schemes designed by the association's architects, Messrs Hendry and Schooling, F.F.R.I.B.A., are given with the following explanatory notes.

The block of flats at Ducane Road, East Acton, is one of several that are now in course of erection on a site overlooking the White City Exhibition grounds, and is interesting as showing a departure from the "cottage" type of two-storied building hitherto favoured by the association, and exemplified in the St. Albans and Ashtead schemes later des-

cribed. The flats are arranged on three floors around a central courtyard, the upper floors being reached by two external staircases which deliver on to balconies running right round the quadrangle.

It will be seen from the drawings that twelve one-room flats are provided on each floor, but two, on the ground floor, are set aside for the possible use of a resident caretaker, although it is by no means certain that one will be required. Each flat comprises a living-room with a bed recess at one end and a work recess at the side. In this "work-shop" of the flat much ingenuity has been exercised in order to economise space and yet leave room for the daily housework to be carried on conveniently. To this end the

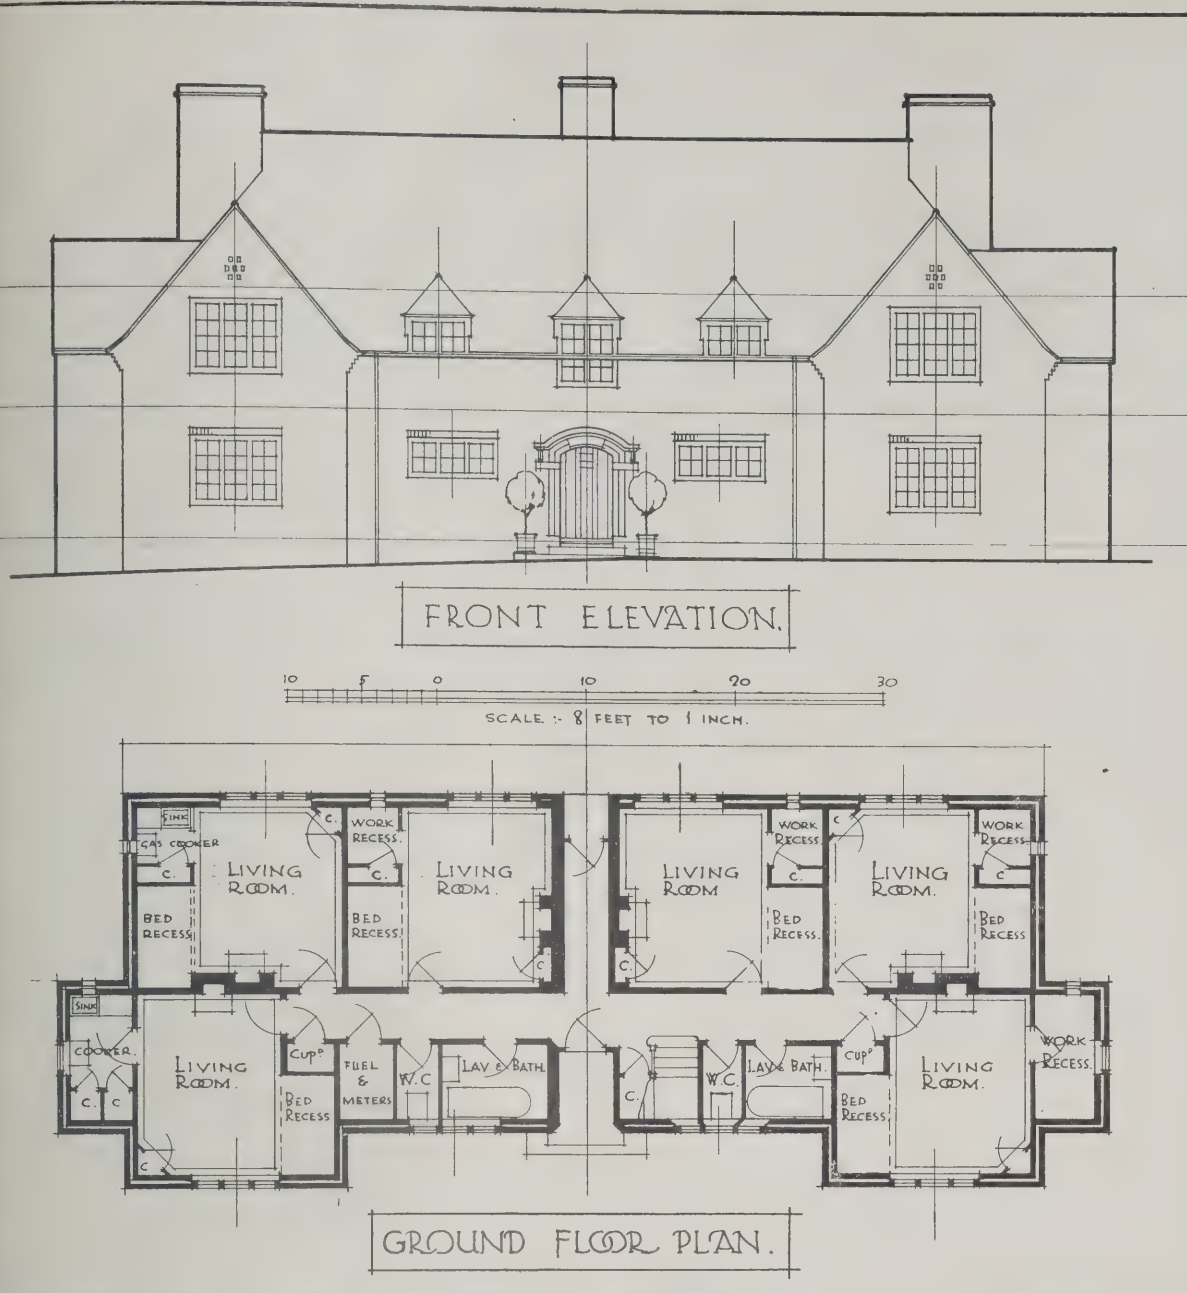

architects were asked to erect a full-size "dummy" of a typical work recess, and this was carefully examined by the committee and certain improvements suggested. It will be seen that, in this tiny space, room is found for a sink with draining board, a small gas cooker of the oven griller type, a 5-foot bath with hinged table top fixed to it, a geyser for the supply of hot water, and a built-in larder, seemingly small, but actually quite large enough for the modest requirements of one person. In addition to these fittings, two store cupboards are provided, of which one is a dwarf only in that the lower part is taken up by a dust-bin recess with access from the outside balcony. There is also provision made for a small coal bunker, with a hopper door on the outside for filling, which is also accessible from the inside. Shelving is also provided wherever possible.

It must be confessed that, at first glance, this multiplicity of fittings looks a trifle "gadgetty," but it is only by practising this intensive economy of space that the scheme becomes financially possible and accommodation can be provided for those needing it. It was hoped to make each flat entirely self-contained, but it was found impossible to pro-

vide a separate w.c. for each flat. A few have them, but, generally, the arrangement provides one for each pair of flats. In effect, this is one per two persons, so that the conditions, if not the most that could be desired, are far better than those that would be obtainable in the majority of lodging-houses or boarding-houses.

The building is perfectly simple, and ornament is rigorously excluded. Externally, the walls generally are of Fletton brick work rendered and finished with a light cream colour wash. The chimney stacks, and plinth up to ground floor window sills, together with the centre projection to the main front, will, however, be built in Dorking multi-coloured bricks jointed in lime mortar. The mansard roof will be covered with sand-faced tiles.

U.W.H.A. FLATS AT ASHTEAD.
MESSRS. HENDRY & SCHOOLING, F.F.R.I.B.A., Architects.

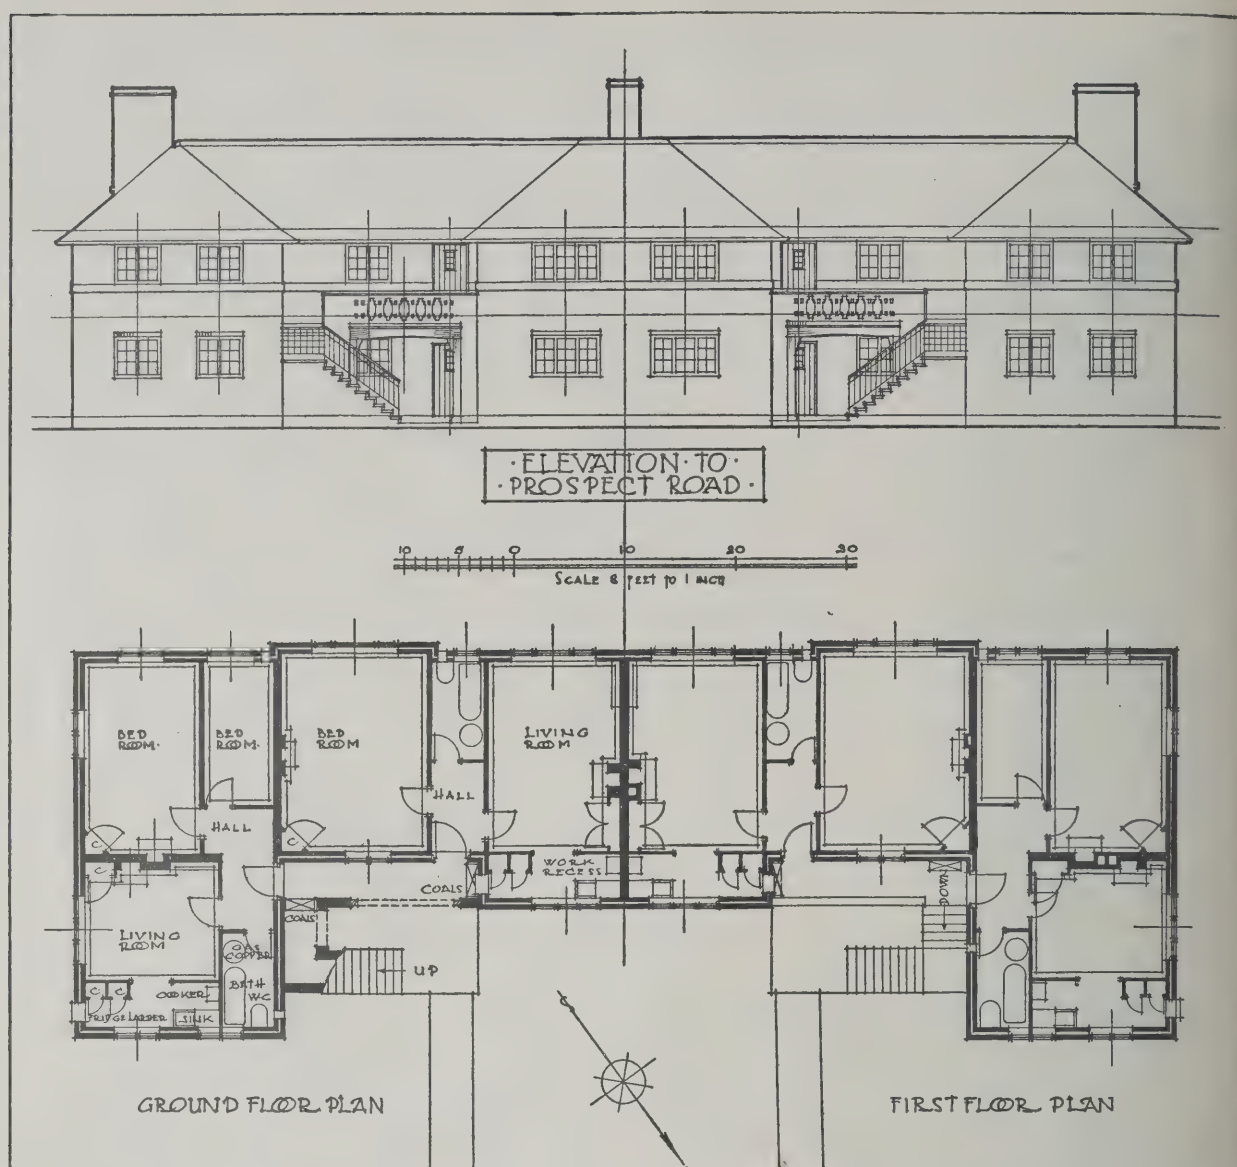

The upper floors are of fireproof construction, ordinary steel filler-joist and broken brick concrete being used for this purpose. For floor covering a special thick cork carpet, of the battleship type, will be laid direct on to the screeded floors. The windows are metal casements in wood frames. These metal casements are found to be more satisfactory than wood for this class of work, and the wide-opening hinges with which they are supplied are a great boon when window cleaning has to be done. The sills are finished internally with 4-in. x 4-in. red quarry tiles, with 1/4-in. joints in white cement.

A scheme on very different lines is being carried out on a corner site in Prospect Road, St. Albans. In this case the accommodation provided is on rather more generous lines, and comprises four flats having one living-room and one bedroom each, and four with one living-room and two bedrooms. There is also a small hall, a bathroom and w.c., and a work recess in each flat.

The special feature of this block is the outside staircase. It is one of the disadvantages of flats in general that, unless there is a porter or caretaker employed, it is nobody's business to look after the

hall or staircase. The result is that these very quickly assume a general air of neglect, and give anything but a prepossessing first impression. It was to overcome this difficulty that the association decided in this case to have external stone steps and balconies giving access to the upper flat. Some risk was taken in deciding on this arrangement, as there is a definite prejudice in many minds against outside staircases. This is fostered, no doubt, by the appearance of the typical tenement building, where the outside staircase and landing, with its usual litter of rubbish and festoons of washing, provides the last dreary touch to a drab and unlovely picture. Anyhow, the risk was taken in this case, and it will be seen from the drawings that an attempt has been made to give the entrance porches, staircases and balconies, some architectural character by treating them as an integral part of the design, and not merely "tacking them on" like an iron escape staircase.

Another controlling element in this design, which may not be obvious from the drawings, is the Government subsidy. As most people know, a house or flat must boast a certain minimum of floor area before it can qualify for subsidy, and, as it was of importance

U.W.H.A. FLATS AT PROSPECT ROAD, ST. ALBANS.
MESSRS. HENDRY & SCHOOLING, F.F.R.I.B.A., Architects.

to the finances of this particular scheme that Government assistance should be forthcoming, the flats were planned accordingly. The internal fittings are similar to those at Ducane Road, except that instead of a geyser for supplying hot water to the bath, a gas copper is provided which has an overflow arrangement by means of which the bath can be filled. Although scarcely ideal, this contrivance has the merit of cheapness, and serves a dual purpose.

The construction is of the usual housing character, with 11-in. hollow brick walls and tiled roof. Red sand-faced bricks from a local field are used externally, and the roofs are being covered with a good sand-faced tile. Metal casements in wood frames are used throughout, the frames being painted externally and stained internally with Solignum, as is the whole of the inside woodwork. The general contractor is Mr. E. Dunham, of St. Albans.

The problem in the Ashtead scheme was to design a series of one-room flats that could be converted, if necessary, into three-room "family" flats. In one of the blocks this has actually been done by the simple contrivance of omitting the bed and work recesses from two of the three rooms.

The site is an extremely pleasant one adjoining Ashtead Park, and, as will be seen from the block plan, the scheme envisages the erection of seven blocks of flats in all, of which four have already been completed and occupied. Here, again, the question of Govern-

ment subsidy was a controlling factor in the planning and each block of twelve one-room flats does, in fact consist of four "subsidy flats." It was desired that these flats should harmonise with the cottages of a pleasant little private housing scheme, designed by the same architects, on an adjoining site, and with this object in view the same types of bricks and tile were used.

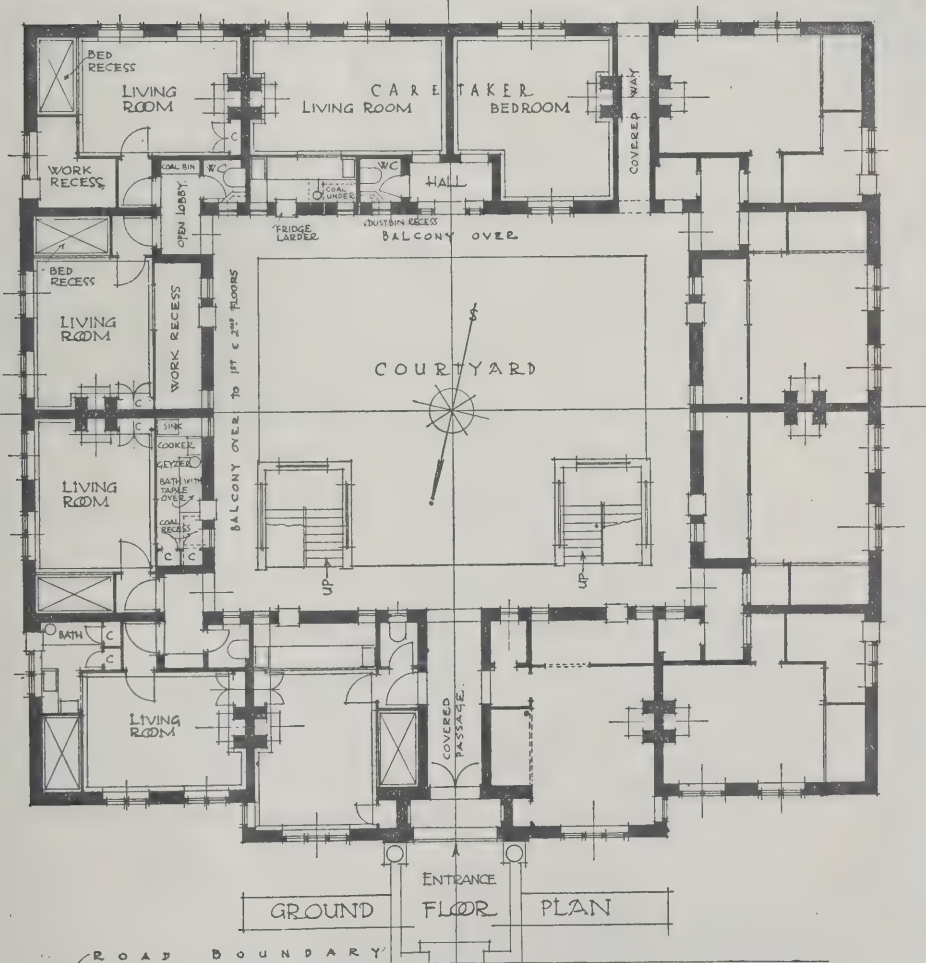

It will be seen from the plan that the accommodation is extremely "tight," especially in the smaller work recesses. The tenants may be suffering in silence, but the remarkably few complaints that reach the association would appear to indicate that the residents are not conscious of any great hardship. In this scheme there is a bathroom and w.c. to each three tenants, hot water being obtained from a geyser controlled by a separate penny-in-the-slot meter in each bathroom. The rent of the one-room flats is from five to six shillings a week. The general contractors were Messrs. Cropley Brothers, of Epsom.

In conclusion, it is interesting to note that this Ashtead scheme has formed the basis of the most important undertaking that the association have so far embarked upon, namely, the provision of some eighty one and two room flats in Hampstead Way, Hampstead Garden Suburb. This scheme is also being carried out by Messrs. Cropley Brothers, under the direction of Messrs. Hendry and Schooling.

NEW HEADQUARTERS, THE SOCIETY OF FRIENDS, ENDSLEIGH GARDENS, EUSTON ROAD, LONDON: MAIN ENTRANCE.
HUBERT LIDBETTER, A.R.I.B.A., Architect.

FRIENDS' HOUSE, EUSTON ROAD

This building has been erected on part of Endsleigh Gardens, as the headquarters of the Society of Friends, to house the various activities connected therewith. The structure consists of three separate blocks, the administrative block, with strong room (A); the central offices of the Society (B); and the offices of the various bodies carrying on Friends' work (C). The latter is entered from the built part of the garden at the east end of the building, and is grouped round a central courtyard connecting directly with block "B," in which are situated the large and small meeting houses, with their attendant cloakrooms, etc. In the basement of block "B" is the heating chamber for the whole building, and on the second floor is the caretaker's flat.

The small meeting house is panelled in British Columbia pine, and with the galleries seats about 275. The large meeting house seats 700 on the ground floor and 600 in the three galleries, 1,300 in all. The walls of the lower portion of the large hall are panelled in dark and light fumed oak, and the upper floors are plastered with special acoustic plaster by Messrs. May Construction Co. Every endeavour was made to ensure that the acoustical properties of the hall should be satisfactory, and this result appears to have been achieved.

Block "C," at the west end, which is called Drayton House, comprises five floors of office space for letting, and is provided with two lifts and lavatories on all

floors. Escape doors have been provided on to the gallery escape stairs of block "B."

Mr. Hubert Lidbetter, A.R.I.B.A., was the architect, Mr. Arthur Boxall, F.S.I. (quantity surveyor), Mr. A. W. Cook, I.C.B. (steel consultant), Dr. G. A. Sutherland (acoustics consultant), and Mr. A. H. Bennett, A.M.I.E.E. (lighting consultant).

The general contractors were Messrs. Grace & Marsh, Ltd., who also supplied the joinery. The sub-contractors include the following: Messrs. Dorman, Long & Co., steel; Messrs. The Patent Impervious Stone and Construction Co., Ltd., stone; Messrs. Claridges Patent Asphalt Co., Ltd., asphalt; Messrs. The Leckhampton Quarries Co., Ltd., interior stone; Messrs. Roger Preston & Co., heating and ventilating; Messrs. Girdlestone & Co., lighting; Messrs. British Thomson-Houston Co., Ltd., electric fittings; Mr. Gilbert Allom, lighting of large meeting house; Messrs. George Wragge, Ltd., steel windows and wrought ironwork; Messrs. Adamsez, Ltd., sanitary goods; Messrs. Drytone, Ltd., interior panelling to the two meeting houses.

The Albert Medal of the Royal Society of Arts for the current year has been awarded to Sir Aston Webb, K.C.V.O., R.A., for distinguished services to architecture. The medal, which was founded in 1863 as a memorial to the Prince Consort, is awarded each year for distinguished merit in promoting arts, manufactures and commerce.

WARD No. 3, WOOLWICH AND DISTRICT MEMORIAL HOSPITAL.
W. A. PITE, SON & FAIRWEATHER, F.F.R.I.B.A., Architects.

WOOLWICH MEMORIAL HOSPITAL

This large hospital, providing accommodation for 665 patients, has been designed by Messrs. W. A. Pite, Son & Fairweather. The layout of the blocks is admirable, all the wards being placed in courts open to the south, while a north aspect is given to the Administration Block, the Central Station, the Laundry and the Operating Theatre. In addition to these buildings, there is a well-composed block utilised as the "Nurses' Home." The communications between the various parts of the hospital have been carefully thought out, all the wards being united at their northern extremities by a long broad corridor giving direct access to the various sections. The whole design is logically conceived, and the hospital seems to possess all the advantages which can be derived from good planning and careful consideration of its practical details.

The elevations also have great merits, although it is perhaps too much to ask that they should represent the same degree of perfection which has been attained in the plan. As a modern hospital contains, besides the wards, a large number of subsidiary apartments of various sizes, and it is by no means easy to give to these a decorous exterior. In spite of this difficulty, however, Messrs. Pite, Son & Fairweather have succeeded in giving their building satisfactory elevations towards several fronts. The main entrance block, containing the administrative offices, is an imposing group, having a three-storeyed central portion crowned by a hipped roof with stone lantern, whilst prominent chimneys at either extremity support this latter feature and help to impart to the building a note of domesticity. The doorway is enclosed in a stone bay surmounted by a segmental pediment joined to stone cornice, which is kept in countenance by a

stone string course under the top row of windows, stone rusticated quoins and a stone plinth, continued along the wings of the building.

The principal court behind the Administration Block is an elegant composition, in which the small central pavilion, with open attic and hipped roof, provides the focal point. The Ward Blocks have flat roofs, suitably treated with wide overhangs. The architects are to be especially congratulated on the arrangement of the open-air stairs from the balconies, in which the landings, supported in square arched structures, become pleasant architectural features.

The general contractors were Messrs. Foster & Dicksee, Ltd., of Rugby and London.

The sub-contractors include the following: Messrs. J. Avery & Co., light-tight blinds; Messrs. Bratt, Colbran & Co., fireplaces; Messrs. Bromsgrove Guild, Ltd., rain-water heads; Messrs. Caxton Floors, Ltd., hollow tile floors and roofs; Messrs. Clark, Hunt & Co., iron railings; Messrs. Dent & Hellyer, Ltd., sanitary fittings; Messrs. Diespeker & Co., Ltd., terrazzo floors and dadoes; Messrs. Doloment, Ltd., jointless floors; Messrs. Earp & Hobbs, Ltd., marble work; Messrs. Thos. Elsley, Ltd., rain-water heads; Messrs. J. Gibbons, Ltd., steel casements, locks, and furniture; Messrs. J. A. King & Co., ferro-glass pavement and roof lights; Messrs. Korkoid & Ruboleum Tile Co., Korkwood tile floors; Messrs. Metro-Vick, Ltd., lamp standards and electric light fittings; Messrs. F. A. Norris & Co., Ltd., iron railings; Messrs. Gilbert Seale & Son, Ltd., carving; Messrs. Some Snapshots of New Buildings in Germany and Austria

Recent work in both Germany and Austria shows a decided trend in the direction of simplified elevational design. The extreme dynamic school appears to be in the background, and works in which vertical or horizontal movement is unduly stressed already appear somewhat old-fashioned. In place of this, an extreme clarity of form is sought after, combined with an appreciation of surface and materials. Such a building as the New Parcel and Sorting Office at Munich is completely devoid of affectation, and depends almost entirely for its effects on an orderly

arrangement of spaces and on a good grasp of their appropriate expression that it is the work of the State Architectural Department indicates a very high standard of general architectural training. Similar in character is the refaced Breidenbacher Hof at Düsseldorf. The architect has produced something extremely delicate and restrained and yet full of character. The masonry of the elevations is treated as slab work, and the pleasing effect of the building largely depends on a nice feeling for its jointing.

VIEW OF REGENT STREET AND PICCADILLY.

NEW PROBLEMS IN THE DESIGN OF STREET FACADES

There are various reasons why it is at the present time more difficult to design a good street façade than it was in the great days of the 18th and early 19th centuries, when urban architecture, both in England and elsewhere, was at its heyday.

WHERE CONDITIONS ARE DIFFERENT FROM THE 18TH CENTURY.

How it came about that for so long a period such a uniform standard of excellence in street architecture was achieved is a difficult question which it would take long to answer. But one may, perhaps, affirm without fear of contradiction that three main conditions contributed to this happy result. In the first place, the buildings were all fairly low; that is to say, of not more than four or five storeys at the utmost, and often of only two or three storeys. Secondly, their stylistic attributes were determined by an æsthetic code accepted without question by architects and builders; and, thirdly, although the operations of building were regulated by certain legal restrictions, these restrictions, or by-laws, happened to be of such a nature that they did nothing to hinder the creation of beautifully proportioned streets and elegant façades. It must, unfortunately, be confessed

that not one of these three conditions, so conducive to the welfare of urban architecture, is present to-day. Let us first take the problem of height. It is too late, of course, to force back the tide of building to a level at which the ordinary street façade might still continue to present the easy and pleasant problem of fenestration to which architects addressed themselves when not more than half a dozen windows need be placed one over the other. Economic conditions and financial pressure have induced the functionaries in control of building regulations to permit a greatly increased height of façade. It is obvious, of course, that when ground rents go up to incredible altitudes it is but natural that the building owner should feel forced to build high in order that the value of his property should be great enough to bear sufficient interest to enable him to pay these enhanced ground rents.

In the 18th century a commercial building, either a shop or a block of offices, would consist of a ground-floor storey of from 12 to 15 ft. in height, well marked off from the super-structure, which would have from two to five rows of windows, of which the top row might be in an attic storey above the main cornice or might even consist of a row of dormers. These

MESSRS. SWAN & EDGAR'S, LTD., PICCADILLY.

J. J. JOASS, F.R.I.B.A., Architect. Architect for the Façade, SIR REGINALD BLOMFIELD, R.A.

windows would be of normal dimensions and, being comparatively few in number, could quite well be given decorative architraves without the façade appearing to be over-burdened with ornament. In the stucco buildings, especially, where ornament of refined and distinguished design could be very cheaply constructed, it was customary for all the windows of a moderate-sized street façade to be adorned with architraves or other formal embellishments, each storey being marked out from the rest by the special and characteristic ornament of its fenestration. Often the height of the windows would increase towards the lower extremity of the façade, and the windows themselves would become more elaborate in treatment. Perhaps the row of windows immediately below the cornice would have plain rectangular reveals, the next row would have a fairly plain moulded architrave; beneath that the windows, in addition to architraves, might have bracketed hoods, while yet another row might be marked by segmental reveals above the windows, decorated with shell ornament or otherwise. The number of variations of this theme was infinite, and while the designer of such types of façade had an enormous repertory of decorative details at his

disposal, this detail was homogeneous, and contributed to the impression that innumerable buildings of that date belonged to the same social family and were the symbols of the same great urban civilisation. In addition to the decorative devices, whereby the individual window was given formal emphasis, where occasion demanded several storeys were grouped together to make larger units of scale by means of the Classic order, which was applied either in the form of engaged columns or pilasters, the latter being the more popular of the two, inasmuch as they were less pompous and more economical to construct. These columns, or pilasters, decorating commercial buildings were generally kept fairly small, so that the privilege of having columns on a grand scale might be reserved for important public buildings. It is noteworthy that this employment of the Orders as an aid to the composition of the façade had as its sole object the increase of the scale of the building, the creation of larger sub-units on which the eye might rest without being confused by too great a multiplicity of rectangular window openings. If, however, the need for this æsthetic simplification was felt by the designers of street façades in the 18th and early 19th centuries,

THE NEW COUNTY FIRE OFFICES, REGENT STREET, PICCADILLY CIRCUS.
 MESSRS. ERNEST NEWTON, R.A., & SONS, Architects. Architect for the Façade, SIR REGINALD BLOMFIELD, R.A.

when the buildings were comparatively low, how much more urgent is this need to-day, when we frequently meet with buildings with several hundred windows on a single street frontage?

TALLER BUILDINGS.

Let us consider a new building, such as the Mayfair Hotel, by Messrs. Henry White & Son. Here we have a quite modern example of a structure of which the fenestration presents just the difficulties which have been mentioned. At its highest portion the building consists of eight storeys, and it has a special interest in that the architects have been content to allow the windows to appear in their naked simplicity, without adornment of any kind, and although in some respects attempts have been made to relieve the monotony caused by the repetition of rectangular apertures (of which about four hundred happen to be visible from the point of view illustrated), one cannot help feeling that this surfeit of windows has become a little tiresome. It is not the length of the building,

but its excessive height which causes the difficulty. If it had consisted of but three storeys it is easy to imagine that an elegant composition might have resulted, even if the windows were scarcely elaborated at all, provided, of course, that their proportions were well chosen and the wall surface were given its appropriate points of emphasis in its basement storey, its cornice or attic, and by various projections or recesses such as might lend interest to the composition. In the design under consideration the architects have, indeed, made a gallant attempt to introduce some architectural features in the form of substantial cornices which do much to bind the composition together, while the projections at the lateral extremities of the main façade help to close it in and to give it a formal unity, this effect being enhanced by the tall attic consisting of two storeys, which dominates the whole. The architects are to be especially congratulated upon their restraint, for there are certain things which they might have done to "liven up" these façades which they omitted to do.

THE HUDSON BAY COMPANY OFFICES, ST. HELEN'S PLACE, E.C.
MESSRS. MEWES & DAVIS, F.R.I.B.A., Architects.

ÆSTHETIC DEVICES FOR RELIEVING MONOTONY OF FENESTRATION.

We are here referring to two, but by no means praiseworthy, devices adopted by architects when confronted with the task of relieving the monotony of a façade containing a very large number of windows. In the first instance it would have been possible to resort to the easy device of placing little balconies here and there to break up the façade. This policy has been adopted very often, and generally with disastrous results, because in most instances the balconies obviously appear to be what, in fact, they are, namely, afterthoughts, irrelevant protrusions, having little æsthetic relationship to the façade as a whole. One commonly finds that groups of windows are chosen for this special privilege of having a balcony when they do not differ in any formal quality from the neighbouring windows which are denied this ornament. This is not to say, of course, that the balcony can never be legitimately used as a symbol of domesticity in architecture, but that it requires for

its proper employment that a special position be prepared for it at the inception of the design. In the case under consideration the few balconies which appear are correctly treated, for they are situated in the main recesses immediately above the ground-floor storey, and elsewhere over the entrance doorways, which give a special reason for a different treatment of the façade immediately above them. Again, it would have been possible to have simplified the façade by combining two or more rows of windows into one single row of tall apertures, which, although embracing more than one storey would yet pretend to be only one. Of all the devices for dealing with the modern problem of fenestration, this is the most indefensible, for it has the effect of falsifying the subject of the building; a series of quite small apartments assume the appearance and status of large apartments, with the result that when we desire to give exterior expression to some public hall or other chamber of important dimension, we find that the architectural symbol by right belonging to it has been malappropriated by buildings of lesser consequence. Fortunately, in

LEATHERSELLERS' HALL, ST. HELEN'S PLACE.
H. A. SAUL, F.R.I.B.A., Architect.

the design under consideration, this species of deception has not been resorted to, and the façade stands out as an example of straightforward design in which the true character of the building as an assemblage of moderate-sized rooms has been declared unequivocally.

ÆSTHETIC FUNCTION OF CLASSIC ORDER.

The time-honoured method by which façades can be simplified and their parts increased in scale is, of course, that of the Classic Order, whereby several storeys are grouped together without it being in the least necessary to do violence to the fenestration. It is just because the Order has in the past performed this particular æsthetic function so satisfactorily, and continues to this day to perform it, we find that its popularity and prestige still remain very high, in spite of the loud protests of those purists who see in this famous instrument of design nothing more than a constructional device. Although it may frequently occur that the Order is misused and becomes pompous and otherwise objectionable through its being badly

placed on any particular façade, there can be no doubt that in many instances it solves the main problem of window grouping. For instance, in the Midland Bank building in Pall Mall, by Messrs. Whinney, Son & Austen Hall, here illustrated, columns are used with effect to simplify the composition and to increase apparent scale. The façade is divided into three main divisions admirably contrasted—the arcaded ground floor storey, the columnated central portion above, and the double row of dormers in the roof. We have here a design which has the virtues of both unity and variety, and which is a compact whole with adequate base and crown and lateral extremities well emphasised. In the second example, a bank building in Buckingham Palace Road, by the same architect, the Order, being confined to the central part of the two top storeys, does less to unify the façade, and in fact, appears almost as a disturbing feature, for it breaks up the main unit of wallage above the basement storey.

Two designs which might conceivably have benefited by a pilaster treatment are a block of offices in Gold

630 miles of paper on a reel—three reels to a “reel magazine”—42 “reel magazines”—126 reels—630 miles of paper! In the sub-basement in Northcliffe House, the new home of the “Daily Mail,” 126 reels of paper are in use or in reserve on the machines every day. Each of the 42 “reel magazines” must be ready to feed 15 miles of paper up through the floor to the printing presses. The new presses in Northcliffe House have a total printing capacity of 756,000 copies of the “Daily Mail” per hour. A reel of paper for the “Daily Mail” is of no light weight. An illustration on this page shows one of the “Daily Mail” reels being trucked into position in Northcliffe House. Another shows a corner of the reel-line and a glimpse of some of the

126 reels, which hold the 630 miles of paper. The concrete surfaces in the basement and sub-basement for Northcliffe House were specified by Messrs. Herbert O. Ellis & Clarke, F.F.R.I.B.A., the architects, to be hardened with “Colemanoid.” The heavy reels of paper on the steel-wheeled trucks must pass daily over these floors. Few floors are called upon to be so resistant to wear and tear as floors in a printing house. Resistance to oil and grease is another necessary attribute, if “newspaper production floors” are to be a success. “Colemanoid” makes floors oil and grease proof. Specifications for similar floor toppings can be had from me at Regent House, Regent St., London, W.1.

The Development of an Ideal — in Craftsmanship

Early XVII Century Man-o'-War, showing sprit sail and sprit topsail, soon to be abandoned for triangular headsails to the bowsprit.

THE discovery of a new world, the invention of gunpowder, and the high standard of seamanship during the Elizabethan era, caused a distinct and rapid development of the art of the craftsmen in ships. So much so, that this age distinctly marks the cleavage between the early vessels of the Viking class and the stately ships of the nineteenth century.

* * *

The practical application of electricity to a yet greater field of human requirements moves apace. Such rapid development can only be met by frank recognition that such an intensely modern science requires equally intensely modern appliances designed and produced in the spirit of progress.

WITH Portland Cement and 'PUDLO' Brand waterproofing powder, the man on the spot does any job of structural waterproofing with no more ado than is required for ordinary good plastering or concreting. Walls in which the dampcourses have perished—walls surrounded by moist earth, and exposed walls subjected to driving rains, are always made perfectly damp-proof with a cement and sand mortar coating, waterproofed by simply adding five pounds of 'PUDLO' Brand waterproofer to every hundred pounds of the cement. Water is kept in tanks, and out of flooded basements with waterproofed concrete and mortar.

'PUDLO' Brand waterproofer is made in England from materials that are entirely produced within the British Empire. It is dependable, and has earned the confidence of eminent architects and engineers in all parts of the world. It has crossed the desert upon the backs of camels, and is used in the extreme climates of Iceland and Patagonia.

SPECIFY BRITISH GOODS

Stocks are held by agents in most of the British Colonies. The address of the nearest agent and a copy of the Handbook of Cement Waterproofing will be sent, post free, upon request. 'PUDLO' Brand Waterproofer is a fine white powder that is not affected by climatic conditions and does not deteriorate if stored with reasonable care.

NORTHCLIFFE HOUSE, TUDOR STREET.
MESSRS. H. O. ELLIS & CLARKE, F.F.R.I.B.A., Architects.

Square, by Messrs. Mewes & Davis, and Messrs. Meaker's premises, designed by Messrs. Adams, Acton. Both these are tall buildings, having a multiplicity of plain rectangular window openings. In the former case some relief is obtained by a cornice with double attic, and by a somewhat insignificant little pediment arbitrarily placed in the centre window of the third row. The ground-floor storey, unfortunately, is scarcely differentiated from the remainder. The latter example has the advantage of a well-marked basement and attic, but the four storeys of windows in between these features have no other adornment than a line of little pediments over the second row of windows, which, in cutting the façade in two equal divisions, compromise its unity.

One of the principal functions of the pilaster is to stabilise the vertical dimension of a façade and thus render it an organic whole, for while either of the last-mentioned façades might have a row of windows added to it or taken from it without the pattern of the fenestration suffering irreparable injury, a pilaster is, as it were, a sensitive organism, and if either its head or its foot be cut off we immediately recognise that a gaping wound has been effected.

In Northcliffe House, by Messrs. Ellis & Clarke, the essentials of the Order have been retained, and while the entablature has been greatly simplified, the cornice being reduced to one great cavetto moulding, the vertical members have recognisable capitals. Here the scale is very large, owing to the windows being almost flush with this wall surface between the pilasters, yet the identity of the several storeys finds external expression. Where, however, it is possible to sub-divide a façade into vertical divisions providing interesting contrasts of dimension, as in Messrs. Mewes & Davis's Hudson Bay office building, here illustrated, the need for the Order is not felt; though, in this particular

instance, it adorns the ground-floor storey, it is no essential to the cohesion of the design.

THE NEW QUADRANT.

The new Quadrant, of which the façades were designed by Sir Reginald Blomfield, the new County Fire office, and Swan & Edgar all provide subject for prolonged discussion for students of urban architecture. It is, of course, recognised that as far as the Quadrant itself was concerned, the architect was hampered by the necessity to incorporate the Piccadilly Hotel in this design. It thus became necessary to maintain the great roof with its double row of dormers, originally a concession to the London County Council building regulations, although the giant chimneys, which so unhappily break the skyline over the hotel, have been omitted in the remainder of the design, except in the County Fire office itself, where they spring up again as a not quite pleasant surprise. In the new façade Sir Reginald Blomfield has eschewed the Order, obtaining an effect of scale by grouping two or three storeys into single window units. Where this device is employed, as in the County Fire office, Swan & Edgar, and the New Criterion, the fenestration itself is elegant, and we almost forgive the architectural subterfuge which has been employed. The windows to the main part of the quadrant are of a repetitive design with little adornment, but as they are well framed in between roof and lower storey they are not in the least monotonous.

The examples here illustrated show the various ways the problem of the street façade is being tackled. No matter what new conditions of building may arise, the elementary principles of composition remain unaltered and while there is plenty of room for experiment the time-honoured methods of design exemplified in the Classic tradition seem likely to hold their own.

ARCHITECTS' REGISTRATION BILL

The Select Committee who are considering the Architects' Registration Bill held a further sitting on June 21, under the chairmanship of Sir Clement Kinloch-Cooke, when evidence was given by Sir Charles Morgan, representing the Institution of Civil Engineers.

Witness, in reply to the Chairman, said he was a past president of the Institution of Civil Engineers, and he desired to point out one or two objections which that body had to the Bill. The principal objection was that the Bill was so indefinite. There was no distinction as to what the nature of architect's work was nor how far it would be affected by the Bill. That was their material difficulty in opposing the Bill. So far as the R.I.B.A. was concerned, they had always had most friendly relations with that body, and they were not wishing to hinder their scheme as outlined in the Bill, provided they could have it confined within some limits, and provided the powers given could be understood by the engineers and the outside public.

The Chairman: You consider that the Bill will not benefit the public and will injure the civil engineers?

Witness said that was so. What they objected to was that the provision with regard to the Admissions Committee proposed to be set up under the Bill was so wide that the Committee might, and probably would, admit men who were engineers, such as structural engineers, and to that extent they might claim, as architectural work, work that had been in the past engineering work and apply to it their own conditions. There was an institution at the present moment that was called the Structural Engineers' Institution, and, if this Bill were passed, it would enable those people to call themselves registered architects and structural engineers, which would be a great encroachment on the work of the civil engineers.

Dr. Watts asked under what clause of the Bill structural engineers could be included as architects?

Witness said the Bill did not mention the point specifically, but it could undoubtedly be the case. The Bill did not stop at saying that a man could be a registered architect, but went on to say that he might be a registered architect in combination with something else.

Dr. Watts: But the mere fact of being a registered architect would not enable a man to call himself a structural engineer unless he had the qualifications.

The Chairman asked witness if he could suggest any definition.

Witness said that was just the difficulty. It was defined in their charter what a civil engineer was, and unless there was some definition in this Bill, men might be able to trespass on that charter. It was well defined what civil engineers had to do, and their structural work was specified. It had been suggested in evidence before the Committee that bridges, for example, might come within the term architecture. Bridges at present were purely engineering work, and Waterloo Bridge, as an example, was built by an engineer, and architects had nothing to do with it.

In reply to the Chairman, witness said that if there were no roaming clauses in the Bill they would be prepared to let the charter stand as it was. They were asking permission to take their names out of Schedule 2, which set out the constitution of the Admissions Committee, because, if they were on that Committee and structural engineers were admitted to registration as architects, it would be tantamount to the Institution admitting that the work of the structural engineers was architectural work. The Bill would allow of men being drawn in who had passed no examination at all, and would allow people to be called architects who, in his opinion, were not architects and never would be.

Mr. Tasker: Has not that always been so with the R.I.B.A., and are not most Fellows men who have never passed an examination, but have been selected for their eminence?

Witness: Yes, that has always been so; but I am referring to those people in a third-rate position. Many people who are practising what I would consider purely structural engineering will come in without any examination at all.

Sir A. Hopkinson asked witness whether he would not feel confidence in the Admissions Committee in view of the fact that it was to contain twelve architects?

Witness said that if the Institution of Civil Engineers were on that Committee they would always be out-voted; but, in spite of that, their presence on the Committee would lead people to think that they were admitting as architects those men whom they wished not to admit.

Sir A. Hopkinson: When your Institution was first founded, did you admit practising engineers without examination?—Witness: Yes. That was found necessary, and I agree that it is necessary when starting a new institution.

And you introduced examinations later on?—Witness: Yes.

May not the architects do that also?—Witness said the position was not the same, because the architects had their institution already.

You have found the establishment of your examination has had a beneficial effect on the profession?—Yes. And in the interests of the public I think it is essential.

In addition to your examination system, you have the hall-mark of the letters of your institution?—Yes, we have that.

Would it not be an advantage to the architects' profession to have some recognition of that sort if they have examinations and the equivalent of a title?—They have it now, but this Bill, I understand, is to let in without examination men whom the Admissions Committee will say are registered architects, and according to Major Barnes, when their examination does come about it is to be to a lesser degree than exists now.

Questioned further as to the limits of engineering work and architectural work, witness said that in Waterloo Bridge the engineers had produced a structure that was worth looking at without an architect (Laughter.) He had been, as an engineer, responsible for the construction of Victoria Station, and they had no architect on that work.

Sir A. Hopkinson: But suppose that you have a beautiful front to a station?

Witness: We had architectural assistance for the front of the station and also for the annexes.

Witness considered that the R.I.B.A., under their present charter, could ask for an Order-in-Council to call themselves registered architects, and thus get everything they wanted without this Bill. The Institution of Civil Engineers had no objection whatever to architects seeking registration.

The Chairman: Did not your Institution promote a Bill with the object of qualifying engineers?

Witness: We did start a Bill of that sort, but we had so many institutions of the different branches of the engineering profession that we did not proceed.

But you did promote such a Bill?—We went out to see what could be done.

That was the Civil Engineers' Registration Bill, and now you are objecting to architects doing the same?—No. We do not object to registration. Our own difficulty was that we found so many different kinds of engineers, each with their own institution, that we

itself to excellent lighting and
effective ventilating arrangements.
It is sanitary and vermin-proof
and altogether particularly suitable
for modern construction.

THE TRUSSED CONCRETE STEEL CO. LTD.

22 Cranley Gardens, South Kensington, S.W.7

had to drop the Bill, and we went to the Privy Council for an Order-in-Council instead.

Sir Murdoch Macdonald: Have you any idea that, if this Bill were passed, registered architects would encroach on the duties carried out to-day by civil engineers?

Witness: I feel so very decidedly. The iron-work and steel structure of the big buildings of to-day is all done by structural engineers and the stone and masonry work by architects, but, if this Bill were passed, the architects would claim that the iron-work and steel structure was part of their work.

Sir Murdoch Macdonald referred to a book recently published, "The Architect in History," and witness agreed that that book showed that there was a differentiation in the carrying out of public works between the engineer and the architect.

Witness agreed, in reply to further questions by Sir M. Macdonald, that the examinations of the Institution of Civil Engineers constituted probably the highest standard of test amongst comparable bodies. They felt that this Bill would encroach on the practice of civil engineers, and perhaps take away from them to a certain extent their means of livelihood.

Sir M. Macdonald, quoting from the book to which he had referred, said there was a feeling that architects would like to take back some of the work that was now done by engineers, such as bridge building.

Mr. Lindley questioned witness as to the position of engineers in regard to the construction of railway buildings, and witness pointed out that railway companies were absolutely exempt from building by-laws. The only thing in regard to which they had to submit to the examination of local authorities was the frontage line and sanitary arrangements. This Bill might, he thought, upset that position. If they let men in as architects by means of the proposed Admissions Committee, the result would be that they would have a large number of young men as registered architects who would not be fit, owing to lack of experience, to assume the responsibilities thus put on them, and would be unable to get work. The Bill would entitle people who had spent five years in a drawing office to be registered as architects; in fact, they could demand registration under this Bill.

Mr. Tasker: Has your Institution experienced any difficulty in finding civil engineers?

Witness: No. Our charter is sufficiently wide.

Your fear is that if the R.I.B.A. cannot define what an architect is in their Bill, they may experience some difficulty in defining what is architectural work in a sense?—Quite.

It is the usual practice of civil engineers to call in the aid of architects and sculptors for the adornment of their works?—Yes, we do sometimes adorn our works with art. (Laughter.)

Your difficulty is that registration is a matter which concerns the architects to-day, and you solved it in your own case through the powers of your Institution conferred by your charter?—No. Our difficulty is that this Bill is going to create a new class of people who will call themselves registered architects, and will also admit certain other people.

Dr. Watts: You do not object to the registration of architects, but to Clause 5 of the Bill by which certain people are taken in without examination?

Witness: I would not like to say that. The question of the Admissions Committee is quite a different thing. They could take in men who are doing what we say is engineering work to-day. If we were on that Admissions Committee as laid down in Schedule 2 of the Bill it would be said that we were agreeing to it.

The Chairman: But you would be there to object.

Witness: We would be only one on the Committee.

Dr. Watts: Do you know what was done with regard to registration when the Medical Acts were passed in 1858?

Witness: I admit there is always a difficulty, when you are starting a new institution, and that you must take in at the beginning those who are established; but architects and the R.I.B.A. have been established a long time, and now they are trying to draw in some people who are not architects.

Dr. Watts: There is nothing at the present time to prevent a bargee or taxi-driver from calling himself an architect. What we want is a qualification laid down by Act of Parliament. You do not object to that, do you?

Witness: We have not the slightest objection. All we object to is taking in people who are not architects.

In reply to Mr. Hirst, witness said that if, at the time of his putting up for election to the Institution of Civil Engineers, any applicant called himself an architect, they would not look at him.

Mr. Hirst: Is it within your knowledge that you have duplicate members of the R.I.B.A. and the Institution of Civil Engineers?

Witness: No. If they came to us and said that they were members of the R.I.B.A. we would not have them.

Lt.-Col. Moore: Your Institution has stated that you are going to show complete opposition to this Bill. Does that mean that you will not consider any amendments?

Witness: No. We did not propose any amendments because we considered the Bill so vague.

Lt.-Col. Moore: Had you any conversations with the R.I.B.A. on the subject?

Witness: Yes. We should have been satisfied if we had been put in the same position as the naval architects, who are taken out of the Bill altogether. Witness added that they were inserted in Schedule 2 by the R.I.B.A. without their consent or knowledge.

Capt. Wallace: You bar architects from sitting for your examinations. How do you define architects?

Witness: As far as our examinations are concerned, if a student says that his studies in the past have been architectural, then he cannot sit.

Capt. Wallace: Then can you define architectural studies?

Witness: No. Other people have tried to do that. If the student has been articled to an architect, then we say that he has been trained as an architect.

The Chairman: Is there any definition of a profession in any Registration Act?

Witness: I do not know.

The Chairman: You are afraid of people receiving the title of registered architect because they are allowed by the Admissions Committee to become registered architects?

Witness: I have no confidence in the Admissions Committee at all. To begin with, there are twelve architects on it. There are surveyors and quantity surveyors and others who do not care two straws about engineering.

The Chairman: Do you not think that the Admissions Committee will be able to distinguish between the work of an engineer and the work of an architect?

Witness: I think they would in the case of two works very close together, such as structural work, but they will say that that work is architectural and will take it in.

The Chairman: Were you not trying to do exactly the same as the architects when the Civil Engineers' Registration Bill was brought forward?

Witness: We found it too complicated.

The Chairman: Then the difference between you and the architects is that the architects have not found it too complicated. The Bill having passed its second reading in the House, the principle is admitted.

Mr. Hirst: Is not that rather an exaggeration? Did not the House pass the Bill so as we could come here to examine it?

At the conclusion of the examination of the witness, the Committee adjourned.

London Building Notes

ACTON.—Middlesex E.C. have accepted the tender of Messrs. Leslie & Co., Ltd., Kensington, £50,263, for the erection of a technical institute and trade school in Acton. The architect is Mr. H. G. Crothall, F.R.I.B.A., County Architect, County Council of Middlesex, 87-91 Tufton Street, Westminster.

BASINGHALL STREET.—A large block of offices, five storeys high, is to be built by Messrs. G. E. Wallis & Sons, Ltd., London and Maidstone, on the site at the corner of Basinghall Street and Gresham Street, E.C.2. The architects are Messrs. Robert Angell & Curtis, 133 Regent Street, W.1.

CARLISLE STREET.—Plans are now in course of preparation in connection with the scheme for the Carlisle Street improvement scheme, in the Marylebone area. It is proposed to rehouse about 2,900 persons in large blocks of tenements, 5 storeys high. Open spaces will be emphasised. The architects are Messrs. H. V. Ashley & Winton Newman, F.R.I.B.A., 14 Gray's Inn Square, W.C.2.

CHISWICK.—Large extensions are to be made to the factory premises at Chiswick, W.3, for the Chiswick Polish Co., Ltd., manufacturers of "Cherry Blossom" boot polish. The new factories have been designed by Mr. A. Alban H. Scott, F.R.I.B.A., 13 Old Square, Lincoln's Inn, W.C.2. The builders are Messrs. Patman & Fotheringham, Ltd., 15 Park Street, Islington, N.1. The steel framework is being erected by Messrs. Dorman, Long & Co., Ltd., 3 Central Buildings, Westminster, S.W.1.

CITY ROAD.—A large block of office and warehouse premises is to be built at the corner of City Road and Featherstone Street, E.C.2. The new premises are to be erected for the Lewis Buildings, Ltd., and have been designed by Mr. William Arthur Lewis, A.R.I.B.A., 11-13 Finsbury Square, E.C.2. The builders are Messrs. Ashley & Horner, Ltd., 8 Aldgate, E.1.

CROYDON.—An extensive shopping "parade" is to be built in Dovercourt Parade, in London Road, Croydon. The plans have been approved, the architects being Messrs. North, Robin & Milsdon, A. & F.R.I.B.A., 35-39 Maddox Street, W.1. The builders are Messrs. The "All-In" Building Co., 59a Walworth Road, S.E.17.

EAST HAM.—Plans passed by the Corporation: Alterations, 255-9, Katherine Road, for Mr. H. Blackman; 5 houses, Raneliffe Road, for Mr. F. Hamlett; additions, East Ham Shopping Hall, Myrtle Road, for East Ham Shopping Hall, Ltd.; alterations, 86 High Street South, for Mr. F. Buen.

EAST SHEEN.—New shops and show-rooms, with living accommodation on the upper floors, are to be erected upon a site in Upper Sheen Road, S.W. The work will be carried out under the direction of Messrs. Knight & Co., surveyors, 1 Sussex Place, Kensington, S.W.7.

ELTHAM HIGH STREET.—The Eltham Conservative Club premises in High Street, Eltham, S.E.9, have been acquired by the Royal Arsenal Co-operative Society, Ltd., 147 Powis Street, Woolwich, S.E.18. Plans are being

prepared by the society's architects' department at Powis Street, S.E., for the adaptation of the property as a branch stores.

HACKNEY.—Building operations have been commenced upon a site in Amherst Road, Hackney, E., where new branch premises of Lloyd's Bank, Ltd., are to be erected. The new bank will be of brick, with stone facings, and has been designed by the bank's building surveyor, Mr. Johnson. The contractors are Messrs. A. E. Roome & Co., Ltd., 7 Warwick Street, E.9.

HAMMERSMITH.—It is proposed to enlarge the Western Ambulance Station and Depot in Seagrave Road, S.W.6, at a cost of £6,000. Plans have been prepared by Mr. W. T. Cooper, M.Inst.C.E., Engineer-in-Chief, Metropolitan Asylums Board, Victoria Embankment, E.C.

HANWELL.—The Ealing T.C. has received sanction to borrow £2,770 for the purchase of a housing site between Drayton Bridge Road and Framfield Road, and the Borough Surveyor is to prepare estimates, etc., for the provision of parlour and non-parlour houses on the site, and also for the provision of three-bedroom flats on the whole of the site.

HARLINGTON.—Middlesex E.C. have purchased a site in New Road, Harlington, for the erection of an elementary school, which is estimated to cost £16,000. The architect is Mr. H. G. Crothall, F.R.I.B.A., County Architect, County Council of Middlesex, 87-91 Tufton Street, Westminster.

HATCH END.—A new parochial hall for St. Anselm's Church is to be erected. The builders are Messrs. Charles Brightman & Son, Ltd., Ebury Road Works, Watford. The architect is Mr. Harold Goslett, F.R.I.B.A., 28 Theobalds Road, Bloomsbury, W.C.

ILFORD.—Plans have been approved for the rebuilding of Nos. 261-275 High Street, Ilford, and the erection of a large dairy, restaurant, stables, milk cooling house, depot, etc., for Messrs. United Dairies, Ltd., 34 Palace Court, W.2. Excavations are at present in progress by the builders, Messrs. Henry Knight & Son, 16 Bruce Grove, Tottenham, N., under the direction of the company's architect, Mr. F. T. Dear, A.R.I.B.A., 9 Haycroft Road, Brixton Hill, S.W.

KINGSTON.—As the result of a conference with representatives of the Kingston E.C. and the Surrey E.C., regarding the proposed extension of the Technical Institute, the architects, Messrs. Jarvis & Richards, A. & F.R.I.B.A., 60 Tufton Street, Westminster S.W.1, have received instructions to prepare sketch plans, with an estimate for the proposed extension.

MORTLAKE.—A large extension is to be made to the Electric Generating Station in Mortlake High Street, S.W., for the Electricity Committee. The contractors are Messrs. W. C. Cooper & Son, 201 Hammersmith Road, W.6. The electrical engineer is Mr. C. S. Davidson.

NORTHUMBERLAND AVENUE.—Extensive alterations and improvements, including the installation of new lifts,

are to be carried out at Craven House in Northumberland Avenue, W.C. Plans have been prepared by Mr. W. Curtis Green, A.R.A., 5 Pickering Place, Westminster, S.W.1. The contractors are Messrs. Perry & Co. (Bow) Ltd., 5-6 Victoria Street, Westminster, S.W.1.

REGENT STREET.—Funds are being raised in support of the £250,000 rebuilding scheme of the Regent Street Polytechnic, W.1. A new motor engineering school is to be erected, to consist of the following: Drawing office, woodwork shop, machine shop, trimming shop, paint shop, metal panelwork shop, smith's shop, motor engine laboratory, chassis shop, lecture rooms, etc. The plans have been prepared by Mr. Frederick J. Will, F.R.I.B.A., 62 Oxford Street, W.1.

RICHMOND.—Messrs. A. H. Leon Co. are rebuilding their premises. Plans have been prepared by Messrs. Brewer, Smith & Brewer, The Green, Richmond.

SHOREDITCH.—Plans have been approved for the reconstruction of the "Spread Eagle" public-house, in Kingsland Road, E., for the owner, Messrs. Mann, Crossman & Paul, Ltd., brewers, Whitechapel Road, E. The excavations for foundations are now being carried out by Mr. A. I. Symes, builder, Carpenter's Road, Stratford, E.15. The architect is Mr. William Stewart, F.R.I.B.A., Newlyn House, 4-5 Aldgate, E.1.

SOUTHAMPTON ROW.—The first sections of the steel framework of the second portion of Victoria House, to be built at the corner of Southampton Row and Bloomsbury Square, W.C. are now being erected by the constructional engineers, Messrs. Dorman, Long & Co., Ltd., Central Buildings, Westminster, S.W. The new office will be seven floors in height, and is intended as headquarters for the Liverpool Victoria Friendly Society. The builders are Messrs. James Cammichael (Contractors), Ltd., Wandsworth, S.W. Plans have been prepared by Mr. Charles W. Long, F.R.I.B.A., Bloomsbury Square, W.C.

ST. PANCRAS.—Mr. W. Arthur Rutter, A.R.I.B.A., has prepared plans for the erection of buildings at Praeger Mews, Bayham Street, St. Pancras.

ST. PANCRAS.—Work has recently commenced upon the site of the new North-Western Polytechnic, which is to be erected at St. Pancras, N.W. at a total cost of £1,100,000. The plans are by Mr. W. E. Riley, F.R.I.B.A., M.Inst.C.E. (Messrs. Riley & Glanfield), 6 Raymond Buildings, Gray's Inn, W.C. The builders are Messrs. Cox, Ltd., 44 Praed Street, Paddington, W.2.

ST. PAUL'S CHURCHYARD.—Premises in Paternoster Row, E.C.4, are to be converted into a large restaurant for Messrs. Mac's Restaurants, Ltd., plans prepared by Mr. H. T. Senior, Abbey House, Victoria Street, Westminster, S.W.1. The builders are Messrs. F. G. Minter, Ltd., Fern Works, Putney, S.W. Partition walling by Messrs. Joseph Mears, Ltd., Crab Tree Wharf.

The Week's Building News

The following abbreviations are used: U.D.C. for Urban District Council; T.C. for Town Council; R.D.C. for Rural District Council; E.C. for Education Committee; B.G. for Board of Guardians; P.C. for Parish Council; B.C. for Borough Council; M.H. for Ministry of Health; M.T. for Ministry of Transport; C.B. for County Borough; B.E. for Board of Education. Direct confirmation should be obtained before commitments, for which we cannot be responsible, are made.

ADDISCOMBE.—A new company, called the Addiscombe Cinema Co., Ltd., has been formed (registered office, 46 High Street, Croydon) to build a new picture theatre in Lower Addiscombe Road, Croydon. Plans for a building to accommodate 1,250 persons, with an ornamental frontage, have been prepared by Messrs. L. W. Griffiths & H. V. M. Emerson, architects, 14-15 Coleman Street, E.C.2. The builders will be the Ashford Building Co., Ltd., 36 Bloomsbury Square, W.C.1.

ALFRETON.—A Primitive Methodist church, Sunday schools, and manse are to be erected on a site at Derby Road, Alfreton, by Mr. Robert Watchorn, of Los Angeles. The scheme, which will cost £30,000, also includes the erection of several cottages to replace those which will be demolished. The architects are Messrs. T. Antliff & Son, Ltd., of Derby.

BATTERSEA.—The B.C. are to proceed with the erection of the seventh block of tenements in the Plough Road area, at a cost of £11,000.

BEDFORD.—Mr. G. P. Allen is the architect of a new church to be built here.

BIRMINGHAM.—Large manufacturing premises are to be built at the corner of Great Hampton Row and Constitution Hill, Birmingham, for Messrs. W. Canning & Co., Ltd., metal polishers. The new building will be of four storeys, and will be erected in facing brick to the designs of Messrs. Peacock & Bewlay, F.R.I.B.A., 83 Colmore Row, Birmingham.

BIRMINGHAM.—The E.C. are considering the erection of additional school accommodation at Billesley at a cost of £12,000. Plans have been prepared for an assembly room and eight classrooms, with open verandahs on each side. The architect is Mr. H. T. Buckland, F.R.I.B.A., Norwich Union Chambers, Congreve Street, Birmingham.

BIRMINGHAM.—The B.G. propose to erect a single-storey night nurses' home at Monyhull Colony, King's Heath, the estimated cost, with equipment, being £9,000. Messrs. C. Whitwell & Son, 3 Newhall Street, Birmingham, are the architects, and Mr. N. Greenway is consulting engineer.

BIRMINGHAM.—The B.G. are to carry out various work at the Dudley Road Hospital. Messrs. Martin & Martin and W. H. Ward, 106 Colmore Row, Birmingham, have been appointed architects for the scheme, and Mr. Noel W. Greenway consulting engineer. The Colleshill Bench have approved plans for a cinema house, to be erected at a cost of £35,000.

BLACKPOOL.—Work has been commenced on the new South Shore picture theatre, near Waterloo Road Station. The theatre is to seat 1,500, and the buildings will also include 10 shops and a lecture hall for public gatherings. Major Halstead Best, F.R.I.B.A., F.S.I., is the architect.

BRADFORD.—Plans passed by the Corporation: 26 houses, Harehills Road and Kinston Grove, for Mr. A. Robinson; 4 bungalows, Ashbourne Gardens, for Mr. F. Kirby; 4 houses, Carr House Gate, for Mr. T. R. Robinson; 8 houses, Leaventhorpe Road, for Mr. W. W. Rawnsley; 4 bungalows, Haws Grove, for Mr. S. Priestley; 7 houses, Haworth Road, for Mr. B. Swailes; 6 houses, Whernside Mount, for Messrs. J. Watkin & Co.; 13 houses, Moore Avenue and Poplar Grove, for Mr. F. Wray; 4 houses, Florida Road and Simms Dene, for Mr. A. W. Cooke; 5 houses, Whitehead Place, for Messrs. A. Cansfield & Sons.

BRENTFORD.—The foundation stone of the Brentford Hospital was laid last week. The cost of the building is estimated at £14,000. The architects are Messrs. H. W. Dodge, F.S.I., and R. A. Reid, A.R.I.B.A.; the builder is Mr. George Challis.

BRIDGNORTH.—Sanction has been received by the T.C. to borrow £6,526 for the erection of 12 parlour type houses on the Innage Lane site.

BRISTOL.—Plans have been prepared by Mr. W. H. Watkins, F.R.I.B.A., of Clare Street, Bristol, for a new cinema, to be built on the site of the present St. George's Hall, Redfield, at a cost of £20,000. The work of erection has been entrusted to Mr. Frank Wilkins, Temple Backs, Bristol. The authorities have passed plans for the installation of a balcony to hold 200 persons at His Majesty's Picture House, Eastville. Plans have been passed for the remodelling of St. Stephen's Restaurant, Baldwin Street, Bristol, including the construction of new kitchens and offices. Dining room extensions are also to be made at Hort's Restaurant, Broad Street, the architect in both cases being Mr. W. H. Watkins, F.R.I.B.A.

CARLISLE.—Plans passed by the Corporation: 2 houses, London Road, for Messrs. Benwell & Slack (architects); warehouse, Caldewgate, for Mr. J. Leslie (architect); 2 houses, Brampton Road, for Mr. H. Foxall (architect); bakehouse, Moorhouse Road, for Mr. H. E. Scarborough (architect); 2 houses, Moorhouse Road, for Mr. J. Wigston; alterations, Dalston Road siding, for the British Petroleum Co., Ltd.; store, James Street, for Messrs. Hudson, Scott & Sons, Ltd.

CHESTERFIELD.—The Scarsdale Brewery Co., Ltd., of Chesterfield, have decided to build large new licensed premises upon a site at the corner of Newbold Road and Hawkesley Avenue. Work is shortly to be put into operation on the site, under the direction of the architects, Messrs. Willecockson & Cutts, 12 Saltergate, Chesterfield.

DUDLEY.—The Corporation Health Committee recommend the erection of a new isolation hospital forthwith, on a site on the Priory estate. The Borough Engineer is to prepare a

complete scheme, with all necessary plans, providing for 32 beds, together with an administrative block.

FENTON.—The Burslem and District Co-operative Society are to erect shop premises in Heron Street. The architects are Messrs. Watkin & Maddox, Swan Bank, Burslem, Staffs.

GARSTON.—Mr. H. Lidbetter is the architect of a new Congregational Church Hall.

HAMPTON.—The U.D.C. are making an offer for land in Malvern Road for a housing site. The Surveyor has prepared a preliminary lay-out for the erection of 96 houses on a site near Priory Road.

HERTFORD.—The Joint Hospital Board have accepted the plans of Mr. A. Gray, the Board's architect, for extensions to Hertford Hospital.

HINCKLEY.—The R.D.C. are to build 10 additional houses at Burhage, 10 at Barwell, 8 at Earl Shilton, 4 at Sapote, and 10 at Stoney Stanton.

ISLINGTON.—The B.C. have agreed upon the proposed extension to the Municipal Buildings. These plans provide for a hall providing accommodation for 691 persons seated, and dancing accommodation for 410 persons; reception or dance room with accommodation for 224 persons seated or 178 dancing, and a banquet or supper room, with accommodation for 91 persons seated at table. The estimated cost of the proposed extension, including furniture, fittings, etc., is £48,000. Mr. E. C. P. Monson, F.R.I.B.A., is the architect.

KESWICK.—The U.D.C. has bought the former Midland Bank premises in Main Street, at £2,500, as a site for a new Town Hall.

LANGOLD.—The stone-laying ceremony in connection with the erection of the new Wesleyan School Chapel has now been performed. Sir Alfred Gelder, architect, of Hull, prepared the plans.

LEEDS.—The E.C. have purchased 26 acres of land on the Weetwood Grange estate, Far Headingley, as a site for the boys' and girls' modern schools.

LISKEARD.—Mr. E. C. Hignam, Lic.R.I.B.A., of Liskeard, has prepared plans for the erection of a Sunday school at Trewidland.

LIVERPOOL.—The Corporation are to erect 260 tenements and 6 shops on the Melrose estate.

LIVERPOOL.—The important central corner site, 17-19 Church Street, with the frontage to Williamson Street, has been purchased by Lloyds Bank, Ltd., for new bank premises.

LLANDUDNO.—The Mostyn Estates, Ltd., have submitted to the U.D.C. a plan of the proposed town planning of the urban district.

MANCHESTER.—Messrs. J. Joseph & Co., 51 High Street, Manchester, propose to extend their premises, 53 and 55 High Street and Spring Alley. The plans are being prepared by Mr. P. C. Larmouth, architect and surveyor, 23 King Street, Manchester.

BRONZE SHOPFRONTS FOR EXPORT

WITHOUT charge we are glad to submit designs and estimates for bronze metal shopfronts (c.i.f. for any colonial or foreign port).

The fronts are exported with working details which enable them to be fixed by any working joiner.

The practical advantages of bronze metal over wood fronts in warm climates amply repay the small additional cost.

The æsthetic advantages are demonstrated in two catalogues, *Bronzework* and *Shopfronts*, which can be had on application to:

HASKINS

EST. 1784

LONDON, E.17

MANCHESTER.—The Ellerman Lines, Ltd., shipowners, 11 Albert Square, Manchester, are proposing to make structural alterations to their premises, which have frontages to Albert Square, Brazennose Street, and Queen Street, Manchester. The plans have been prepared by Messrs. J. W. Beaumont & Sons, F.F.R.I.B.A., architects, 24 Brazennose Street, Manchester.

NEWCASTLE.—The Housing Committee of the T.C. has instructed the Council's architect to prepare a layout for a site for a school at Cowgate.

NEWCASTLE-ON-TYNE. — Extensive alterations and improvements are to be effected to the licensed premises in Westmoreland Road, known as the "Grainge Hotel." Plans have been prepared by Messrs. Marshall & Tweedy, 54 Grey Street, Newcastle-on-Tyne.

PAIGNTON. — Plans have been passed by the U.D.C. for eight houses, Elm Park, Colley End Road; twelve houses, York Road; and sixteen houses on a new road off York Road.

READING. — Some very important developments, involving building operations costing some £150,000, are contemplated by the directors of Messrs. Huntley & Palmer, Ltd., the well-known biscuit manufacturers, who have recently adopted plans prepared by Messrs. Holman & Goodsham, 6 King's Bench Walk, Temple, E.C.4. Extensive new factories are to be erected, upon which work will be commenced at once.

REDRUTH.—A new hall is to be erected as an addition to the West Cornwall Miners' and Women's Hospital at Redruth. The plans have been prepared by the architect, Mr. Leonard Winn, L.R.I.B.A., of Truro.

RICHMOND.—An important building scheme is being undertaken by the Army, Navy and Royal Air Force Board of the Wesleyan Home Mission Committee at Catterick Camp. A new chapel is to be built for Wesleyan soldiers, to cost £10,000.

SHEFFIELD. — The Catholic Congregation have acquired a site on the Manor estate for the erection of a new church and Sunday schools. New day schools to accommodate 400 children are also to be erected, and Canon Dolan, who has the scheme in hand, estimates the cost at £10,000. The District Wesleyan Home Mission Committee have approved provisional plans for a new Wesleyan church, to be erected on the Manor estate, at a cost of about £10,000.

SHOTTON. — The foundation-stone has been laid for the new school at Flemingfield, which will cost £6,000.

SPALDING. — Old premises in the Market Place are being pulled down, and the site cleared, to make way for an extension of the branch premises of the National Provincial Bank, Ltd., of London. The new building will conform to the architecture of the old Market Square houses, and has been designed by Mr. J. C. R. Palmer, F.R.I.B.A., the bank's architect.

STRET福德. — A new General Post Office is contemplated to be erected on a site in King Street. Architects' Department, H.M. Office of Works.

SUTTON COLDFIELD.—The B.E. have approved the plans of the Warwickshire E.C. for the erection of a High School at Sutton Coldfield.

SWANSEA. — Plans passed by the Corporation: 19 houses, Grenfell Park estate, for Messrs. J. R. Banfield & Son; 23 houses, Gorse Road, Cockett Road, for Mr. Syd. Davies; 6 houses, Cockett Road, for Mr. Syd. Davies; 4 houses, Townhill, for Messrs. Jones & Watkins; caretaker's lodge, Girls' High School, Walters Road, for the E.C.; store, Clydach Road, Ynystawe, for Mr. Dd. Hopkins; Mission Hall, Wern Fawr Road, for the Brethren; 50 houses, Menselton, for the Great Western Garden Village Society, Ltd.; 4 houses, Pentregethin Road, for Messrs. Jones & Watkins; 9 houses, Parc-y-due, Morriston, for Messrs. Walters & Johns; 3 houses, Fern Street, for Mr. J. Willis; 17 houses, Grenfell Park estate, for Messrs. Jones Bros.; 6 houses, Limekiln Road, for Mr. B. F. Hoppe.

TRURO.—The Corporation propose to erect 12 small type houses on the Hendra housing estate at a cost of £4,548. The architect is Mr. F. A. Barnes, A.M.I.C.E., Municipal Buildings, Truro.

TUNBRIDGE WELLS.—A new hospital is to be erected at Great Culverton, at a cost of £150,000, to plans prepared by Mr. Cecil Burns, 23 Old Buildings, Lincoln's Inn, W.C. The new institution will accommodate 150 beds.

WAKEFIELD. — The City Architect has submitted a map showing the preliminary zoning of the Sandal area for town planning purposes.

WAKEFIELD.—The Corporation Improvements Committee have asked the City Surveyor to prepare a sketch plan for the lay-out of a public health centre. The City Surveyor has prepared a perspective sketch showing the proposed extension of the Technical College, for the E.C.

WARRINGTON.—Mr. D. Cooper is developing the Bruche estate, and is to erect 36 houses. Mr. A. H. Leece, Bold Street, Warrington, is the architect.

WARRINGTON. — Plans have been passed by the Corporation for eight houses in Menin Avenue, for Messrs. W. & A. Ashton. Mr. M. J. Johnson, Queen's Chambers, Sankey Street, is the architect.

WATFORD.—Mr. H. A. Gold, M.C., F.R.I.B.A., of London, has accepted the position of joint architect with the borough engineer for the new library to be erected by the Watford Corporation at Little Nascot.

WHITCHURCH.—Mr. M. W. Sowden, surveyor, has prepared a scheme for the U.D.C. for the erection of 42 houses on the Highgate and Rosemary Lane sites.

WIGAN.—On a site at Boar's Head, Standish, near Wigan, a new petrol station is to be erected. The plans have been prepared by Mr. W. Harold Johnson, architect and surveyor, 23 King Street, Wigan.

WIGAN.—Messrs. Montague Burton, Ltd., of Leeds, propose to make altera-

tions and extensions to their branch premises at Standishgate, Wigan. The plans have been prepared by Mr. Harry Wilson, architect, 12 Victoria Park Avenue, Kirkstall, Leeds.

WIGAN.—On a site fronting Wallgate and Miry Lane, Wigan, a new motor showroom and garage is to be built. Mr. W. H. Johnson is the architect for this scheme. In the showroom provision is made for 12 motor cars, and the garage will accommodate about 100 cars.

WIGAN.—The T.C. have decided to proceed with the erection of public baths at Pemberton, for which plans have been prepared by the B.E. It is proposed to refloor the Market Hall with wood blocks, at an estimated cost of £2,418. Plans have been approved for alterations and additions to the Palais de Danse, in Millgate, for J. & W. Atherton; alterations to the Adelphi Hotel, in Harrogate Street, for Messrs. Cunninghams; new church of St. Stephen's, Heilan Road, Whalley, Messrs. Austin & Paley, architects, Lancaster; alterations and additions in Mesnes Road, for Mr. C. H. Kirton.

WILLESDEN. — A Public Utility Society has been formed in Willesden, with the Right Rev. the Bishop of Willesden as president; Professor Adshead, F.R.I.B.A., as hon. architect, and Mr. Charles H. Brightiff, A.R.I.B.A., as hon. surveyor. A scheme has been prepared by Prof. Adshead for the reconditioning of unsuitable and insanitary and overcrowded houses, and the erection of blocks of flats for working people, as well as to keep in constant survey the whole of the conditions in congested areas. The society are appealing for £10,000 to commence the scheme.

WORCESTERSHIRE C.C. — Worcester City Council are to carry out repairs at the County Buildings, in accordance with a report. Mr. Vernon Rowe, 38 Foregate Street, Worcester, is the architect. The estimated cost is £3,000.

WORKSOP. — Mr. H. Brakspar, F.S.A., has the work in hand for the restoration of the Priory Church. The scheme comprises the rebuilding of the south transept. The completed plans allow for the rebuilding of the choir at a cost of £10,000, and also rebuilding of the north transept at a cost of £4,000. Funds are being raised to provide a new parochial hall for St. Anne's, estimated to cost £5,000.

WOKING. — The U.D.C. propose erecting 14 houses, for which purpose a loan of £6,400 has been obtained. Mr. G. J. Woolridge, Woking, architect.

WOKING.—Plans have been passed by the U.D.C. for six houses, Rosebery Crescent, Kingfield, for Mr. A. E. Jones; shops and showrooms, Commercial Road, for Mr. W. Triggs Turner. Mr. F. W. Kinns, 14 Broadway, Woking, is the architect for the latter.

WREXHAM.—The County Council have decided to establish a mental deficiency home at a cost of £120,000. The architect is Mr. J. H. Edwards, Argyle Street, Wrexham.

NORTON, STAFFS.—The contract for the erection of the Church Hall at Norton has been let to Mr. S. Jolly, of Milton, at a cost of £1,150.

THE LARGEST PRESSED STEEL TANK in the WORLD

This tank, supplied to the Nairobi Municipality, Kenya Colony, holds *One Million Gallons* of water, and is built from standard plates 4 feet square to a depth of 16 feet.

The Braithwaite Pressed Steel Tank is of standardised construction, built up from unit plates 4 ft. or 1 metre square, which are bolted together; the joints being made tight with a plastic compound of simple application.

The shape of the plates combined with a unique system of staying gives great strength to the tank with the minimum of weight.

The two sizes of unit plates give an exceedingly wide range of capacities, and tanks can be provided in depths up to 16 feet or 4 metres for water, fuel oils and other liquids.

A large stock of component parts is always available, and careful marking for erection ensures successful installation, skilled labour being unnecessary.

Future needs can be provided for as increased capacities can be given by extending tanks already in use.

London Building Notes

(Continued from page 51)

STRAND.—Premises at the corner of the Strand and Surrey Street, W.C.2, have been acquired by Messrs. The Midland Bank, Ltd., who propose to convert them into branch offices. Plans have been prepared by Messrs. Whinney, Son & Austen-Hall, 8 Old Jewry, E.C.2. The builders are Messrs. Hickman, Ltd., 10 Great Russell Street, W.C.1.

TOTTENHAM.—The U.D.C. have passed plans for 5 houses in Dowsett Road for Mr. G. Allen; 5 houses in Thackeray Avenue for Messrs. Walters & Blake; 6 houses in Park View Road, for Mr. Williamson; 8 houses in Northumberland Grove, for Mr. Allwright; 8 houses in Kimberley and Dowsett Roads, for Messrs. Bysouth & Son; a factory in Colsterworth Road, for Messrs. Bertish & Co.; and a warehouse in Overbury Road, for Kinloch, Ltd.

WESTMINSTER.—The Senate of the University College of London (King's College) have approved plans for the erection of a new hostel for theological students, to be located upon a site in Vincent Square, S.W.1. The new building will consist of four floors of studies, with a chapel, and will be faced with Portland stone and selected brick. The architect is Mr. A. C. Martin, F.R.I.B.A., 9 New Square, Lincoln's Inn, W.C.2.

WESTMINSTER.—The City Council have chosen Mr. Alfred W. S. Cross, F.R.I.B.A., of 45-46 New Bond Street, W., as the architect for public baths and washhouses, a highways depart-

ment depot, a maternity and child welfare centre, and a rate collector's office, to be erected on the site of the Marshall Street Baths and Washhouses and the adjoining site in Darfour's Place.

WHITECHAPEL.—The premises at No. 138 Whitechapel Road, E.1, are to be converted into a large restaurant and café at a cost of about £10,000. Extensive alterations are involved, including the installation of new heating and electric lighting systems, and art metal display shop fronts. Plans have been prepared by Messrs. North, Robin & Milsdon, A. & F.R.I.B.A., 35-39 Maddox Street, W.1.

WILLESDEN.—The Willesden U.D.C. have sanctioned a scheme for the erection of 1,200 houses. The architect is Mr. G. Warren Peachey, 13 Arundel Street, W.C.2.

WOOLWICH.—Fifty-three houses are to be erected on the Eltham housing estate for the Corporation, at an estimated cost of £30,647.

British Industries Fair

The Government have rented the White City, London, for the British Industry Fairs of 1928, 1929 and 1930. The next Fair will be held simultaneously in London and Birmingham, from February 20 to March 2, 1928, and will be by far the largest British Industries Fair on record. The available exhibition area exceeds by 180,000 square feet previous exhibition accommodation. Invitations to upwards of 10,000 British manufacturers have been sent out for the London exhibition by the Department of Overseas Trade.

Trade Publications

Some useful hints on the prevention of rust in domestic boilers, during the summer months when they are not in use, are contained in a folder which has just been issued by Messrs. The National Radiator Co., Ltd., from whom copies may be obtained on application to their head office at Hull, or their London showrooms, 439-441 Oxford Street, W.1.

The Triangular Construction Co., Ltd., Imber Court, East Molesey, Surrey. *Modern Building Construction*. (20 pp.). A new treatise upon the Triangular System of Construction, fully illustrated to show the latest developments.

Walter Slingsby & Co., Ltd., Woodhouse Road, Keighley. *"Wash" Malleable Iron Pipe Fittings—List No. 160*. (48 pp.). This list illustrates a wide range of pipe fittings and includes much useful data upon pipe threads and pipe flanges, some of which has been reprinted by permission of the British Engineering Standards Association.

A. Ransome & Co., Ltd., Stanley Works, Newark-on-Trent. *Ransomes Woodworking Machinery*. (80 pp.). A new catalogue (S.26), showing many new designs in modern woodworking equipment, in addition to a range of their standard machines.

Personal Note

The Newcastle E.C. has appointed Mr. Harry Cotton, aged 31, as architectural assistant. Mr. Cotton at present occupies a similar position with the Derbyshire Educational Authority.

The "John Tann" Safe Book

is more than a catalogue, its aim being also to provide a short scientific treatise on Safe and Strong Room Construction.

THE House of Tann have over 40 years' more experience of safe making than any other firm in existence, and during the whole history of the firm, dating back to 1795, no John Tann Fire- and Burglar-Resisting Safe has ever had its contents destroyed or stolen.

John Tann, Ltd., are in a position to supply and install Safes, Strong Rooms, Doors, and every other kind of security work, from a light Fire-Resisting Safe or Door, suitable for private houses or small business premises, to a massive structure designed to withstand every conceivable contingency.

From 1795 to the present day the House of Tann have maintained their position as the world's premier Security Engineers.

This profusely illustrated book will gladly be forwarded to responsible applicants.

JOHN TANN Safes & Strong Rooms

Architects are invited to consult the Technical Dept. of John Tann, Ltd., on any question relating to Safe or Strong Room Installation.

No. 7 Wharf, Amberley Rd.
Paddington, LONDON, W.9

Telephone : PADDINGTON 2192

CEMENT is becoming indispensable in practically every department of constructional work, but its use from a decorative point of view is scarcely appreciated as yet. Beautiful and permanent coloured effects in Cement work, rough-cast, etc., are easy of achievement by the use of

FECC.
PRODUCTS
for Colouring, Hardening and Weatherproofing all Cement work.

The permanent Exhibition of practical work in this direction at

Service and Demonstration Dept.:
28 Victoria Street, London, S.W.1.

is well worth a visit when next in England.

PARTICULARS BY POST ON RECEIPT OF PROFESSIONAL OR TRADE CARD.

Protect the Timber with SOLIGNUM

The necessity for protecting timber against dry rot, decay and the attack of White Ants and other wood-destroying insects, increases in importance as each year sees a reduction in the World's available timber supplies.

Experiments with untried or inferior articles are costly and useless. The better plan is to specify and use Solignum, which has been tested and proved in all climates and under all conditions for over a quarter of a century.

But it must be Solignum. Imitations and substitutes should be avoided.

For indoor staining and Decorative work Interior Quick Drying Solignum should be used. For protection against Dry Rot and insect pests specify Exterior Brown Solignum.

Regd. Trade Mark

WOOD PRESERVATIVE AND STAIN

We offer co-operation in Dry Rot Cases. Write to Major & Coy., Ltd., 205 Borough High St., London, S.E.1

Glazing at Bute House,
London, W.

MELLOWES & Co., Ltd., have had fifty years' experience in the development and manufacture of "Eclipse" Roof Glazing.

It is the actual test of time that has proved the endurance of Mellowes products, and Architects and Contractors all the world over have learnt to specify "Eclipse" where there is need for the finest quality possible in material and workmanship.

MELLOWES

"ECLIPSE" PATENT

ROOF GLAZING

MELLOWES & CO., LTD., SHEFFIELD AND LONDON

A 14

THE "ECLIPSE" patent glazing bar is designed to give the maximum efficiency in the transmission of light.

The steel core of the various sections is dimensioned on sound Engineering principles, with a high factor of safety.

The lead sheath, which is hydraulically extruded in one piece, carries three webs each side, which function as follows:—

- (1) Top web to keep out the weather.
- (2) Intermediate web as an additional safeguard against the weather and also to form a cushion between the edge of the glass and the steel.
- (3) Underneath web to form a ductile cushion on which the glass may rest, protected against breakage from vibration.

MELLOWES SERVICE

offers advantages that will be appreciated:—

Quick Manufacture to exact requirements due to our wide range of patterns and large resources in production:

Prompt delivery direct to site by our own Motor Transport.

Experienced Agents in every town of importance.

BETONAC

Concrete with the Strength of STEEL

By the use of the new metallic aggregate, BETONAC, in place of chipped granite, crushed stone or gravel, a steel-hard, non-porous concrete is produced possessing unique advantages.

BETONAC Steel Concrete is as durable as the solid metal; as adaptable as ordinary concrete. It is completely waterproof and practically dustless; it can be floated with mathematical precision; it does not disintegrate under stress. It is not affected by frost.

BETONAC metallic aggregate is made in grades to produce any type of surface from dead smooth to rough. It is economical to use and can be adapted for many purposes for which ordinary concrete is unsuitable.

REGD. TRADE MARK

The Wolsey Underwear Factory -roofed with RUBEROID

THE extensive North Light boarded roofs of the factories in which Wolsey Underwear is manufactured are covered with Ruberoid Roofing. Ruberoid is particularly adapted to this form of roof construction and to the requirements of Textile Manufacturers. Ruberoid forms a roof light in weight yet permanent, and is unaffected by the vibration of machines in constant motion. Its air-tight and non-conducting qualities enable the heating of large workshops and workrooms and their ventilation to be properly controlled. The Ruberoid Roofs on the Factories of Wolsey, Ltd., have been in use for over 13 years and continue to give that uniformly good service which has made the Trademark "Ruberoid" known throughout the world for durability and reliability.

The word "Ruberoid" is a registered trademark indicating the manufactures of the Ruberoid Co., Ltd. Ruberoid is easily identified by the name and trademark on the wrapping of every roll.

RUBEROID ROOFING

Illustrated catalogues giving full particulars of the advantages and methods of using Ruberoid Roofings and Dampcourses will be sent on request

"Achievement is but another milestone along the highway of progress—the end of the journey lies ever beyond."

THE CHATWOOD TRADITION.

SUCCESS

The parents of success are Originality and Determination and the grandparents are Hard Work and the pursuit of a definite pre-conceived aim.

To achieve success in industry, attention to detail and a balanced mind are of much greater importance than academic knowledge.

We are all born with certain natural gifts and acquire others by observation and experience as a result of the environment in which we live.

The great firms of to-day owe their success to these factors, and the co-ordination of the individual efforts by an executive who inspire a feeling of happy confidence.

The Chatwood Success has for a foundation the experience of almost 75 years. Throughout the firm is an atmosphere of growth, new knowledge, and new ideas.

J. E. S.

THE CHATWOOD SECURITY

We have carried out security contracts for the leading Bankers throughout the world, with a result that this wide experience has given us most useful data and memoranda, which are always at the disposal of the Architect, with whom we are pleased to consult without obligation of any sort.

THE WORLD'S LARGEST

Lignitine

OIL VARNISH STAIN

*Stains and Varnishes
at the same time*

Floors and Woodwork generally can be *permanently* stained and given a fine lasting gloss with "Lignitine."

It saves labour—the most costly item.

Ordinary deal can be made to resemble the more expensive timbers by the use of "Lignitine."

It penetrates the wood and the surface does not crack, break, peel or flake off—it stands the hardest usage.

*Supplied in a variety of shades—Walnut,
Oak (Light, Medium & Dark), Mahogany
Rosewood, Ebony and Satinwood.*

A product of the
firm with a reput-
ation of 75
Years for
Varnishes and
Enamels of
Quality.

ARNISH INDUSTRY

Pearline

THE IDEAL ENAMEL

*For Decorations of Distinction
and Durability*

Pearline has a pure and dense whiteness which does not yellow.

It is unrivalled for its brilliant and lasting gloss.

Pearline is guaranteed by "the World's Largest Varnish Industry" for durability and resistance to wear and climatic influences.

Its covering and oblitative capacities are greater than those of any other enamel.

Pearline has a perfect flow, works easily and does not leave brush marks.

*In three finishes — Brilliant Gloss,
Matt and Semi-Matt. Pearline is
also supplied in various delicate tints.*

WATER HEATERS

COOKERS

ELECTRIC WATER HEATERS

Constant Hot Water by just switching on.

A "Belling" Immersion Heater.

Hot Water by Electricity.

You can have a wonderful service of hot water, cheaply, without fuss, bother, dirt or trouble by installing "Belling" Immersion Heaters in the hot water tank.

They can be used either independently of, or in conjunction with, a coke fired boiler.

ELECTRIC COOKERS

The No. 6, suitable for 4-7 persons.

"Belling" Electric Cookers are very cheap to run and ensure the most delicious cooking. Switches giving a choice of three heats are provided, thus enabling any desired rate of cooking to be achieved.

Instal one and your kitchen will always be clean and cool. There are no gas fumes, no sooty flues, no ashes and no dirt.

The "Belling" Boiler Griller.

Just the thing for small houses, flats or maisonettes.

A RECORD ACHIEVEMENT

LONDON'S LATEST SUPER-CINEMA

THE ASTORIA, completed in the record time of 32 weeks. Photograph shows the Balcony, the steelwork of which is carried over a span of 90 feet entirely without intermediate supports. The whole of the steelwork in the building made and erected complete by DAWNAYS.

ARCHIBALD D.

Telegram: "DAWNAY Battersea, London"

CONSTRUCTION

STEELWORKS ROAD
BATTERSEA LONDON S.W.11

Also at EAST MOORS
CARDIFF

6 BANK STREET
NORWICH

UNDER this Contract, the old Crosse & Blackwell buildings in Charing Cross Road give way to the largest Cinema and Dance Hall in London. The old main walls are retained.

The main roof girders, each of 90 ft. span and weighing 14 tons, were raised in halves owing to confined space, the sections meeting in mid-air as here shown.

The Cinema floor is above, and the Dance Hall 16 ft. below, the pavement level, and both halls are provided with a gallery.

The whole of the heavier loads, including, of course, the roof, are carried on steel stanchions direct to the foundations 60 ft. below, to avoid overloading the old walls.

The adoption of steel construction enabled the roof to be covered in and permitted internal work to proceed under protection from the weather, a factor of great importance.

Architect: E. A. Stone, F.S.I.,
20 Berkeley Street, W.I.

Dawnays New Handbook now in course of preparation will, on application, be sent to Architects and Builders as soon as published.

365 SETS WERE RECENTLY EXPORTED TO THE BOMBAY PORT TRUST

THE LEEDS FIRECLAY COMPANY'S Contributions to Modern Building Construction

Leeds is the centre of the Fireclay Industry and the centre of Leeds is an excellent example of the use of Burmantofts Terra Cotta.

This aerial photograph demonstrates clearly and unmistakably the suitability of Terra Cotta for architecture in Industrial Cities. The centre of Leeds, smoke blackened and soot-begrimed, appears dingy, dull and depressing, save where Terra Cotta, with its clean appearance, brightens the pervading gloom. If our great cities were built entirely of Terra Cotta, the effect on the health of the inhabitants would be most beneficial. Burmantofts Terra Cotta offers the architect all that other building materials can give, with added advantages of absolute permanence, cleanliness of appearance, and ease of construction.

THE LEEDS FIRECLAY CO. LTD.

Head Office: WORTLEY, LEEDS.

Telegrams: Fireclay, Wortley, Leeds.

Telephones: 20121 (four lines)

THE LEEDS FIRECLAY COMPANY'S PRODUCTS

include

BURMANTOFTS TERRA COTTA (Vitreous or Unglazed), FAIENCE, and "MARMO." "Marmo" is a Terra Cotta of marble texture with an impermeable matt surface, made in White, Cream and a variety of colours. Remaining for all time quite unaffected by the atmospheric influences which cause stone to disintegrate in cities, it affords to Architects a guarantee that their carefully designed details are permanently retained and distinguished.

GLAZED BRICKS, TILES, and the well-known "SHEPWOOD" REGD. GLAZED PARTITION BRICKS (2 $\frac{1}{2}$ " on bed). Their imperishable, indestructible, impervious and lasting qualities have won a world-wide reputation.

FIRECLAY SANITARY WARE & FITTINGS. Baths, Lavatories, Closets, Urinals, Sinks, Hospital Fittings and Drainage Pipes and Fittings, etc. Durable, because of the fireclay material which is the base of their construction; and sanitary, because of the smooth imperviously hard, impervious glaze. Neither time nor constant use affects them or shortens their length of utility.

Colonial or other Architects visiting England are invited to call at our new London Showrooms shortly to be opened at 2 Cavendish Place, where arrangements would be made for visiting the works in whose manufactures they are chiefly interested.

STEEL-CRETE FLOORING HEAVY

This is how other users describe their experience of STEEL-CRETE

FOURTEEN YEARS AGO.	"We have not found it necessary to make effect repairs of any kind and it preserves the same even and unbroken surface as when laid 14 years ago. We have pleasure in recommending STEEL-CRETE, etc., etc."
SEVEN YEARS AGO.	3,500 yards in a Factory. Two more floors completed for the same since.
FIVE YEARS AGO. <u>TO-DAY.</u>	7,000 yards in a Paper Mill. Have just completed another 4,000 yards for the same Company.

STEEL-CRETE is the Ideal Floor for Factories, Garages, Abattoirs, Warehouses, Wash-houses, etc.

STEEL-CRETE Floors are Wear Proof, Durable, and Proofer it is unsurpassed.

STEEL-CRETE Floors are Economical because they last so long.

STEEL-CRETE is largely used in India, Rangoon, etc.

IF YOU REQUIRE A FLOOR WHICH WILL STAND THE HARDEST WEAR, AND WHICH WILL LAST FOR YEARS, SPECIFY STEEL-CRETE AND REFERRING TO THE MANUFACTURER.

Permoglaze your walls

Permoglaze

REGD.
A LIQUID GLAZE FOR WALLS &C.

A liquid preparation which, when exposed for some little time to the air, sets with a hard, glazed surface that will not soften and can be freely washed.

Supplied in WHITE & COLOURS, in two standard grades as follows:

" SLOW-SETTING "

(Dry in 8 hours).

Suitable for all general purposes, Inside and Outside, Walls—Brick, Plaster, Concrete, and also Wood and Ironwork.

" QUICK-SETTING "

(Dry in 2 to 3 hours).

May be used instead of "Slow-Setting" if desired, on inside Walls only—Brick, Plaster and Concrete.

Supplied in UNDERCOATING & FINISHING, ready for application, packed in half-gallon and 1 gallon air-tight cans and 6 gallon drums.

EASILY APPLIED

SETS HARD AS
TILES

PERMOGLAZE is the modern wall-finish that is rapidly replacing distemper and ordinary paints and enamels where a clean, *easily washed* wall surface is desired.

A permoglazed wall has a hard, tile-like surface to which dust and germs cannot cling. It is impervious to moisture, bright and healthy, easily washed down, and lasts for years.

Permoglaze is easily applied with a brush to walls, be they bare or previously painted or distempered; and can be used on Brick, Plaster, Stone, Concrete, Wood and Ironwork.

Permoglaze is a very fit and serviceable coating for walls, etc., in Bathrooms, Lavatories, Kitchens, Passages, etc., and is largely specified and used also in Hospitals, Hotels, Schools, Cinemas, Public Institutions, Breweries, Laundries, Dairies, Factories—and wherever cleanliness is important.

Booklet describing Permoglaze and "How to Permoglaze Your Walls," together with list of standard colours available, will be sent post free on request, to Architects or users applying on business memorandum.

OVER 100,000 TONS LIFTED FOR LESS THAN £6

COST OF RENEWALS.

Such a feat may be considered incredible, but it has been accomplished by two "Wadsworth" Electric Lifts in Liverpool.

The Lifts are 15-cwts. capacity, speed 130 ft. per minute, and have made 650,375 trips mainly under the worst conditions, viz., up loaded, and down empty.

The original steel wire hoisting ropes are still in use, and in good condition.

This is another striking example of *Reliability* and *Economy* in service under arduous conditions for which

WADSWORTH QUALITY LIFTS

are appreciated all over the world, and accounts for 75 per cent. of our present business consisting of repeat orders.

"The two 'Wadsworth' high-speed Lifts in our Warehouse enable us to expeditiously unload an almost continuous stream of motor lorries, and deliver the goods on the five floors of our building while another truckload is being made up below.

"Considering that the Lifts are scarcely ever stopped during the day, it speaks well for their design and construction that no trouble or stoppage occurs. We have no regret whatever in having placed our order with you, and would have every confidence in engaging your services again should the need arise."

DOMESTIC
HOT-WATER
BOILER

INSTALL THE FALCO—
The Solution of all Hot
Water Problems.

Hot water day and night in
Kitchen, Laundry and Bath-
room. No trouble—no worry
—no waiting. Cheery open
fire when required—neatly
designed—simply constructed
—strongly built—easily regu-
lated—roomy hot-plate for
cooking—burns rubbish—in-
expensive—easy to install—
—trouble free.

THE
"Smoothtop"
Gas Range

SPECIFY THE "SMOOTHTOP"—
the Gas Cooker that ensures the maximum
cooking service at the minimum cost. There
is no other Gas Range so modern in its
labour-saving and economical qualities.

The smoothly polished top (no irritating grids)
retains every particle of heat and keeps several
vessels boiling or simmering with only one
burner alight.

Automatic lighter to hot plate burners—no
matches needed.

The hot-plate is at the most convenient height,
and the cooker stands well above the floor—
ample room for cleaning underneath.

The oven door opens downwards, forming a
very handy shelf for basting, etc.

Strongly built, enamelled inside and out.
Saves labour, time, gas and money.

The Acknowledged BEST Joint for Copper Tubes

1927—NEW TYPE

"SECUREX"

Patent No.
244253

Registered

**IMPROVED FITTINGS
For Light and Heavy Gauge Copper Tubes**

The inside sleeve, as shown in the illustration, is now attached to the hexagon nut, but retains the circular movement necessary to give a straight draw up on the copper pipe, which is essential in compression joints. This makes the fitting in three detachable parts in place of four, and simplifies the joint to the workman. It also makes the joint more foolproof, as the sleeve cannot be lost or forgotten before the pipe is expanded. This is important to contractors.

"SECUREX" Improved Fittings have been installed in Devonshire House, Blackadon Hospital, County Fire Brigade, London, Ministry of Pensions Hospital, Leeds, Birmingham University, Royal Infirmary, Preston, New India Buildings, Liverpool.

Awarded Royal Sanitary Institute Medal, 1925. Tested and approved by principal Water Boards. Specified by leading Architects.

New Illustrated Catalogue and Price List Now Ready.

2 HANDS ARE BETTER THAN 1

Equip your Drawing Office
with
**AXENE MAGNETIC
TEE SQUARES**

and

DRAWING BOARDS

because they mean greater speed with greater efficiency

THE OUTSTANDING FEATURES OF OUR EQUIPMENT ARE

- 1** It is sound and practical and the worker is enabled to use both hands all the time.
- 2** While the Tee Square remains dead true to position it slides smoothly when required.
- 3** The special stainless steel working edges are scientifically more accurate than the usual ebony edges, and are, moreover, much more durable.
- 4** No clamps, no springs, no wires, no pulleys, no special drawing tables are needed—all these are banished by efficient magnetic action.
- 5** It compares favourably in cost with any other first class production.
- 6** The leading users are unanimous in their recommendation. They include the Government Departments, Borough Councils and the chief engineering and industrial concerns.

THE
BOSS
COUPLING

**MAINTAINS
ITS PRE-EMINENCE**

THE BOSS COUPLING was first introduced in 1909 for the purpose of making efficient joints in Copper or Brass Tubes without SCREWING or BRAZING.

Since its conception the BOSS Coupling has given universal satisfaction and many thousands of these fittings have been used in various institutions throughout the country.

THE BOSS COUPLING TO-DAY IS THE OUTCOME OF 18 YEARS' EXPERIENCE IN THIS CLASS OF FITTING and is put forward as the greatest labour and material saving device, compared with any other form copper pipe jointing, on the market.

It secures the greatest economy and minimum of waste, and enables standard tubes to be employed without special annealing, at the same time ensuring accuracy in pipe alignment and perfect jointing under the highest pressures of steam, water or compressed air. Send for our B2 Catalogue—it will interest you.

Now one fire does the work of many - - -

FROM a furnace in the basement, "Pipeless" Central Heating warms evenly every room in the house. Day and night, upstairs and downstairs, the whole house is filled with fresh, warm air.

One fire does the work of many, giving more heat and healthier heat, with a minimum consumption of fuel. The furnace burns anthracite, coke or wood fuel, and requires only slight attention.

In the case of installation in existing premises, extensive structural alterations are unnecessary, the only visible means of heating being an inconspicuous grating in the hall.

The photograph above shows the furnace as installed in the basement of a London house. Special models are available for houses in which there is no basement.

AN ENTIRELY NEW TAP

—no washers
—no seatings

CLOSED

OPEN

THIS new, improved tap has no washers, and can neither splash nor drip. The designs are modern, the workmanship is faultless, and the lasting qualities such that we guarantee every tap against leakage for seven years.

Yet with all these advantages the washerless tap is no dearer than the old-fashioned washer tap. Also there is no expense of maintenance, which is a very important item.

In the course of a Physical Laboratory test, a washerless tap was turned on and off 268,000 times (equivalent to 18 years' use) without showing signs of leakage. *Every* washerless tap is tested under hydraulic pressure at 450 lbs. per sq. inch.

Agents wanted in all towns—Write for particulars and terms of an attractive offer.

No longer a Luxury— but an economy

Beautiful tiled walls may now be obtained at a price far below that of ordinary tiling. 'Permanite' Asbestos Tiled-Sheets can be fixed at a fraction of the usual cost of such work and the low initial cost is the only cost—there are no maintenance charges to be considered.

'Permanite' Asbestos Tiled-Sheets have the appearance of the best tiles, but they will not crack, fade or discolour despite heat or damp. The sheets are supplied in a standard size, 48" x 48", and can be fitted by any carpenter direct to timber battens—no plaster is necessary—another big saving.

PERMANITE ASBESTOS TILED-SHEETS for Wall Decoration

Both Dado and plain tiled effects are now available in ivory, green, heather, light blue, lavender, grey, etc. Write for particulars of this modern decorating material.

Supersedes plaster for all types of high-class building work. "SUNDEALA" panels are absolutely waterproof and will never crack or warp.

Illustration shows "SUNDEALA" ceiling in one of London's largest departmental Stores.

Supplied in six sizes, ranging from 6' x 3' to 12' x 6'.

Write to-day for details.

G. D. PETERS & CO., Ltd.

Caxton House, Westminster
London, S.W.1

Branch Office: 47 Peter Street, MANCHESTER.

Suppliers to H.M. War Office, H.M. Office of Works, and many other leading Authorities.

The "SANKEY"

Down Draught Preventing Pot

Architects, in increasing numbers, are favouring the "Sankey" Pot, the reason being its effectiveness in curing smoky fireplaces, coupled with its neat appearance.

Designed on quite original lines, it entirely obviates zinc cowl and tops which rattle and creak in every breeze.

"Sankey" Down Draught Preventing Pots are made in Red, Buff, and Saltglazed Clays, and are practically everlasting.

"Sankey" Pots, owing to their beautiful simplicity of design, go well with any type of architecture. They fall into the general scheme as if they were part of the architect's original plan.

Please write for Illustrated Booklet and full particulars.

44 Years of Writing Efficiency

For 44 years Waterman's has been recognised as the most efficient of all writing instruments. Its outstanding superiority has been proved by many millions of writers. The SPOON FEED, among other features, is world-famous. It solves completely the problem of the automatic control of ink from barrel to pen point. There have been many imitations, but no one has ever discovered anything to equal it for simplicity and efficiency. Scientific research has proved that the principle is absolutely correct.

Many of the original Waterman Pens purchased 30 to 40 YEARS ago are still giving perfect service !

Waterman's (Ideal) Fountain Pen

See the latest model - the RIPPLE-RUBBER PEN

Ripple-Rubber is a Waterman creation. It is of Vulcanite, exquisitely marked and coloured in red and black. Wherever seen it excites comment by its beautiful and attractive colouring.

Ask your Stationer or Jeweller to show you Waterman's Ripple-Rubber Pens.

Prices from 21/- . Ripple-Rubber Pencils to match, 7/6, 10/6, 15/- and upwards.

Of Stationers and Jewellers.

"The Pen Book" free from:

L. G. SLOAN, LTD. The Pen Corner, Kingsway, London, W.C.2
Use Waterman's Ideal INK—Best for all Pens.

Here is one of those delightful pencil sketches by Earl Horter. It suffers by being shown in greatly reduced size. Earl Horter in his wanderings all over Europe has executed many fine drawings with the aid of Dixon's Eldorado pencils. He writes:

"I like your 'Eldorado' pencil for three reasons. It is friendly to my touch, responsive to my mood, and it reproduces better than any other pencil I have ever used. A definite, clear-cut quality is essential in every drawing that is made for high-light half-tone. Even soft tones made with the 'Eldorado' seem to carry a certain hidden depth that helps the camera. It is a fine, capable pencil, and I like it very much indeed."

In 17 degrees and copying—one for every need or preference.

4d. each.

3/6. per dozen.

36/- per gross.

DIXON'S ELDORADO

"the master drawing pencil"

Just as Dixon's "Eldorado" is supreme in pencils, so are Dixon's Best Coloured Pencils in the realm of colour. Try them and see.

4d. each.

3/6 per dozen.

36/- per gross.

Of Stationers, Artists' Colourmen, etc.

Send for this Free Book

"The Eldorado News," 23 pages—contains sketches in black and white and colours by Earl Horter, Vera Stickland, G. E. Studdy, Bruce Bairnsfather, and others—also a chart to help pencil users. FREE on request. Will you write for one?

— the simple system —

Wiring System that is neat

"MODERN ELECTRIC WIRING" is an apt title for the Art Brochure we issue in connection with the Henley Wiring System—"the wiring system that is neat."

Its 32 pages are devoted to illustrating and briefly describing a representative number of buildings at home and overseas in which the system has been installed, and it gives a résumé of what has been accomplished with this modern method of installing electric wires.

A portion of the descriptive matter from page 3 is reproduced here:

"For the country mansion or in fact for any existing building, the great advantage lies in the fact that an installation by means of the Henley Wiring System is so inconspicuous. It can be hidden in out-of-the-way places and it obviates cutting away and damage to architectural features."

The advantage of neatness is one that has made the Henley Wiring System so widely used and recommended. The system can be installed quickly and without great expense, and it has been used in more buildings than any other system of its kind.

A copy of our Art Brochure B.B., which has been recently revised, may be useful to you for reference. We will gladly post a copy on receipt of your request.

Manufacturers of all classes of
 Glazed and Unglazed Tiles for
 Walls, Floors, Fireplaces, Etc.,
 including Ceramic and Roman
 Art Mosaic.

As Specialists in bathroom work, and not
 content merely with keeping pace with
 hygienic progress in this sphere, we have re-
 cently introduced an entirely new class of
 fittings which gives a definite lead in this
 direction. In general, these fittings are re-
 cessed in the wall, of which they form an
 integral part. Those which necessarily pro-
 trude from the wall—such as the coat-hook
 —are provided with a shank which is firmly
 keyed in the wall. In this way, they form
 an essential part of the original conception of
 the bathroom, and come in an especial
 manner within the province of the Architect.

Looking ahead

Remember that every square inch of the surfaces of your property has two enemies: Dirt and Decay. That is why you must ensure that, in addition to possessing artistic and hygienic qualities, the decorative materials selected must be able to give thorough and lasting protection

In Pinchin, Johnson Super-Finishes, you have a sterling series of Paints, Enamels, Varnishes and Distempers that have been endorsed by actual and hard experience, everywhere. They beautify and protect, both inside and outside, are economical in use, and will resist the action of weather and climate more thoroughly than any other materials.

Cement: The Cement to be used shall
be "Ferrocrete" supplied by

In your own interests you would do well to write your specifications as indicated above.

It is not sufficient merely to state that the cement shall be of a quality which complies with the requirements of the current British Standard Specification.

Where time contracts are concerned it is especially important that you specify "Ferrocrete" by brand name to ensure completion by due-date.

Ferrocrite speeds up construction by allowing work to advance on 4-day shifts instead of 28-days.

Ferrocrite saves money in that it saves time, equipment, watching and lighting, and gives you a margin of safety on all time contracts.

The increase in the use of Ferrocrite for all kinds of concrete work is proof of its ability to serve you.

Ferrocrite Bulletin, an illustrated monthly magazine of latest building development, sent FREE on request.

MAGICOAL FIRES
are found!*

Berry's Electric Ltd. were the Pioneers of the Electric fire with the coal fire effect (THE MAGICOAL FIRE) and they still lead the field. THE MAGICOAL FIRE has the flickering enchantment indistinguishable from a living coal fire.

The coals are not just pieces of coloured glass, but are manufactured from specially prepared materials to represent coal in its various stages of combustion; and when out they have the appearance of an undisturbed fire. Scientific construction has been made compatible with artistic design. No dirt and ashes are made, whilst labour is reduced to the touch of a switch.

In addition to its unparalleled heating efficiency THE MAGICOAL FIRE gratifies the natural love for the genial fireside.

GLASS FOR EXPORT

Overseas Architects and Builders will be interested in knowing that the rapid expansion of our business necessitates the carrying of very large stocks. We always have in reserve a minimum of 500,000 ft. of Polished Plate, in addition to Wired, Rolled and Rough, Wired Cast, Opal Plate, Marmorite and every other kind of glass which may be specified.

We have our own Departments for Bevelling and Polishing, Silvering, Embossing, Brilliant Cutting, the making of Leadlights, Ventilators, Reflectors, etc., and the work is carried out by skilled workmen, under personal supervision.

Finally, our clients abroad can have every confidence in our Packing Department. Years of experience enables us to guarantee the safe arrival of the glass (under normal conditions of course), both as regards breakage and climatic effect.

A SUGGESTION

Mirrors for Export should always be treated with our famous METALLITE Wet-Proof Backing. This process renders the mirror absolutely impervious to steam, wet or grease, even under the most exacting conditions. Not only does METALLITE preserve indefinitely the beauty of the mirror, but it obviates the expense of periodical renewal.

VOL. II. THE LATER RENAISSANCE, 1640 to 1830

COATOSTONE

A COAT OF STONE WHICH HARDENS LIKE STONE

APPLIED WITH A BRUSH.
ANY PAINTER CAN USE IT.

Made in 2 Grades, i.e.
for "INTERNAL" and
"EXTERNAL" use.

WATERPROOF

INDISTINGUISHABLE FROM
SOLID MASONRY WHEN
LINED OUT IN BLOCKS

A FRENCH STUC EFFECT AT
A QUARTER THE COST.

USUAL MIXINGS ARE
PORTLAND AND BATH BUT
COLOURS CAN BE SUPPLIED
TO CUSTOMERS' PATTERNS.

Applied direct on Concrete, Brick, Tile, Asbestos, Wood, etc. In fact COATOSTONE will adhere to almost anything and everything.

COATOSOL

A Colourless, Transparent, Waterproofing Solution which does not conceal the grain of the stone nor change the colour; it soaks in and hardens the face and prolongs the life of the fabric. Also suitable for Brickwork, Asbestos, Unglazed Terra Cotta, etc., etc. One coat better than two of other makes.

COATO-ROUGH-CAST

Applied with a brush direct on Concrete, Brick, Tile, etc. No cement rendering required. Great Saving in Time and Labour. Unsurpassed as an artistic and weather resisting external coating for all classes of buildings.

COATO GLOSS

BUILDING ON THE TRIANGULAR SYSTEM

A Method of Building Construction most suited to Overseas conditions.

The Triangular System of Construction is particularly adaptable to local conditions and has many advantages over other methods of erecting buildings in cement.

Triangular instead of rectangular units are used. These are designed so that the wall produced is of great strength and rigidity, being a braced structure like a lattice bridge member (see illustration). The wall is hollow, having continuous vertical cavities, the outer and inner faces being tied by diagonal bonds formed by the blocks themselves. The outer face of the wall is impervious to weather conditions, whilst the inner face is porous to prevent condensation.

Being hollow, the inner and outer faces of the wall are insulated. The wall has therefore a much higher thermal efficiency than a solid wall—an important point where extreme climate conditions of either heat or cold, or both, have to be met.

Unskilled native labour can be employed for the erection of the walls with only a minimum of skilled supervision, the system being almost foolproof.

By means of the "Trianco" machines (which are portable) unskilled labour can be employed to make all the necessary building units on the site from cement and materials usually obtainable locally. Among these machines is one for making tiles. Full illustrated particulars will be sent on request.

The Triangular System is fully patented in England and the Principal countries of the world.

There are enormous possibilities for the successful exploitation of the Triangular System in every country, as shown by its extraordinary success in England. Companies have already been formed or are in course of formation in various countries. The English company are prepared to negotiate with interested parties for the formation of further companies.

Communications should be addressed in confidence to the Managing Director.

About fuses

During the last 20, 30, 50, or more years much electrical installation work has been done and done well enough to be still in use, although both metallic and insulating ingredients have deteriorated; similarly, any work done to-day will have partially lost its high quality twenty-five years hence, no matter how good it may have been in the first instance. What, then, is the guardian angel protecting the old work and able to do so for the new? The answer is "Fuses." The many installations now running may be first-class or second-class, or even no class at all, but so long as they are competently protected by fuses very little harm can happen to them.

and-

SLYDLOK FUSES

Between the lines of the above extract from an "Electrical Review" leader lies the fact that there are fuses and fuses. There's the conventional type "stamped-metal-and-porcelain" unit; there's the SLYDLOK, with its solid-drawn components and unbreakable moulded insulation; and—there's all the difference in the world between the two. That's why those responsible for important installations demanding absolute safety and surety of operation specify SLYDLOKS and why we number leading British manufacturing, municipal and private undertakings amongst our consistent customers.

SLYDLOKS are fire, vibration- and fool-proof; have machine-faced, interlocking contacts; can be locked and sealed against unauthorised interference; need no ironclad protection and no "earthing" and are adaptable for Main and Sub-services, Distribution Boards, Traction and Portable Equipment, Switchboards, Cookers, Controllers, &c. This folder introduces this British fuse more fully and will be found interesting.

merely slates is like asking merely for wine or clothes, with deserving results in matters where one cannot be too particular.

To be particular in roofing materials is essential if one wants a roof of practical and æsthetic value. A pretty effect alone does not constitute a sound roof; there must also be durability of material.

For their lasting qualities and charm of colour Old Delabole Slates are justly famous and they make roofs of distinctive and enduring beauty.

LAMBERT WATER HEATERS

"The Heater with the White-Tiled Appearance"

A neat and compact apparatus (only 20 ins. long, 6 ins. wide and 10 ins. high), which provides boiling water for all domestic purposes in less than a minute. Costs little to instal. Perfectly safe—it cannot explode—and as easy to manage as the ordinary

kitchen gas ring. With its attractive white-tiled appearance, the "Lambert Heater" enhances the beauty of any room. It is a British invention and British-made throughout. A guarantee is given with all Heaters fixed by the manufacturers' own staff.

PRICE from £6 : 15 : 0

Full particulars with pleasure, or our Sales Engineer will call on request.

The Lambert Heater & Engineering Co. Ltd.

HANBURY WORKS, HANBURY ROAD, ACTON, LONDON, W.3.
Telephone : Chiswick 3954.

A HOT BATH at a cost of 1½d. 4 TO 5 BOWLS of HOT WATER at a cost of 1½d. BOILING WATER at the rate of over a quart per minute. Official tests (Cambridge Engineering Lab.) prove the "Lambert" to have working efficiency of 88.5 per cent. when delivering water at a temperature rise of 64.5° (F.).

PROUT'S CONTINENTAL SKETCHES
Proofs on thick plate paper in handsome portfolio, cloth, gilt lettered, size 21 in. by 15 in., price 42s. net.

The work consists of 75 plates, and was originally published at 30 guineas. The plates are the full size of Prout's drawings and are an exact reproduction by the PERMANENT INK PHOTO PROCESS.

Mr. Ruskin, author of "The Seven Lamps of Architecture," etc., etc., referring to these drawings, says:—

"Prout drew every lovely street in Europe."
"Prout ransacked every corner of France, Germany, the Netherlands and Italy."

"I have," said Mr. Ruskin, "both in my earlier books and in my lectures at Oxford, spoken of the sketches of Prout with reverence and enthusiasm."
"Numerous as have been his imitators, extended as his influence, there has yet appeared nothing at all to equal them; there is no stone drawing, no vitality of architecture, like Prout's."

"The sharpest photograph is not half so natural."

May be obtained from
THE PUBLISHER,
Rolls House, 2 Bream's Buildings,

NOTICES.

THE
**INCORPORATED ASSOCIATION
OF
ARCHITECTS AND SURVEYORS**

ENTRANCE WITHOUT EXAMINATION.

The list will close not later than August 31 next. Meantime, in view of the proposed Registration of Architects, and in order that unattached Architects and/or Surveyors may be protected by this Association, the Council has decided, for a limited period only, to admit applicants without examination provided they satisfy the Board in regard to their qualifications.

Enquiries should be addressed to the Secretary of the Applications Board, I.A.A.S., 15 Bedford Street, W.C.2.

ARCHITECTS' REGISTRATION BILL.

The Association supports the principle of Registration, and is in favour of the retention of Clauses 11 and 12 with but slight modification. It submits that the R.I.B.A., in agreeing to drastic amendment of these clauses, is not doing justice to itself or the profession.

TENDERS.

TO BUILDERS.

THE Commissioners of His Majesty's Works, etc., are prepared to receive **TENDERS** before 11 a.m. on Thursday, July 14, 1927, for the erection of a Post Office and Telephone Exchange at Ilford.

Drawings, Specification and a copy of the Conditions and Form of Contract may be seen on application to, and Bills of Quantities and Forms for Tender may be obtained from, the Contracts Branch, H.M. Office of Works, King Charles Street, London, S.W.1, on payment of one guinea (cheques payable to The Commissioners of H.M. Works, etc.). The sums so paid will be returned to those persons who send in tenders in conformity with the conditions.

TO PAINTERS.

THE Commissioners of His Majesty's Works, etc., are prepared to receive **TENDERS** before 11 a.m. on Friday, July 15, 1927, for Internal Painting at Sanctuary Buildings, Great Smith Street, S.W.

Specification, a copy of the Conditions and Form of Contract, Bills of Quantities and Forms for Tender may be obtained from the Contracts Branch, H.M. Office of Works, King Charles Street, London, S.W.1, on payment of one guinea (cheques payable to The Commissioners of H.M. Works, etc.). The sums so paid will be returned to those persons who send in tenders in conformity with the conditions.

TO BUILDERS.

THE Commissioners of His Majesty's Works, etc., are prepared to receive **TENDERS** before 11 a.m. on Tuesday, July 19, 1927, for Alterations and Additions to the "Midland" Telephone Exchange, Birmingham.

Drawings, Specification and a copy of the Conditions and Form of Contract may be seen on application at H.M.O.W., 42 Paradise Street, Birmingham.

Bills of Quantities and Forms for Tender may be obtained from the Contracts Branch, H.M. Office of Works, King Charles Street, London, S.W.1, on payment of one guinea (cheques payable to The Commissioners of H.M. Works, etc.). The sums so paid will be returned to those persons who send in tenders in conformity with the conditions.

TO BUILDERS.

THE Commissioners of His Majesty's Works, etc., are prepared to receive **TENDERS** before 11 a.m. on Wednesday, July 13, 1927, for Alterations and Additions to Eastville Employment Exchange, Bristol.

Drawings, Specification and a copy of the Conditions and Form of Contract may be seen on application at H.M.O.W., 25 George Street, Bristol.

Bills of Quantities and Forms for Tender may be obtained from the Contracts Branch, H.M. Office of Works, King Charles Street, London, S.W.1, on payment of one guinea (cheques payable to The Commissioners of H.M. Works, etc.). The sums so paid will be returned to those persons who send in tenders in conformity with the conditions.

TO BUILDERS.

THE Commissioners of His Majesty's Works, etc., are prepared to receive **TENDERS** before 11 a.m. on Tuesday, July 12, 1927, for the erection of an Employment Exchange at Newcastle, Staffs.

Drawings, Specification and a copy of the Conditions and Form of Contract may be seen on application at Marsh Street Employment Exchange, Newcastle.

Bills of Quantities and Forms for Tender may be obtained from the Contracts Branch, H.M. Office of Works, King Charles Street, London, S.W.1, on payment of one guinea (cheques payable to The Commissioners of H.M. Works, etc.). The sums so paid will be returned to those persons who send in tenders in conformity with the conditions.

APPOINTMENTS.

ARCHITECT WANTED.

A LARGE public concern in the Midlands
require the services of a qualified ARCHI-
TECT to prepare the necessary drawings of a
building which it is estimated will occupy about
twelve months to erect.

Applicants should state their qualifications, with
particulars of designs they have carried out, and
will be required to work under the direction of the
management. Address, stating age, salary and date
when services would be available, to Box 151,
"The Architect & Building News."

CITY OF CARDIFF EDUCATION COMMITTEE

THE TECHNICAL COLLEGE.

PRINCIPAL: CHARLES COLES, B.Sc. (Lond.)

INSTRUCTOR IN BUILDING TRADES
SUBJECTS.

THE services will be required in September
next of a Full-time Instructor in Carpentry
and Joinery (Theoretical and Practical). Appli-
cants must hold the Final Certificate of the City
and Guilds of London Institute in Carpentry and
Joinery, or its equivalent.

Salary Scale: £225-£12 10s.-£375 per annum.
(Applicable to instructors with five years' prac-
tical experience after the age of 21 years).

Applications on foolscap paper, stating age, full
qualifications, teaching and other experience, and
giving copies of not more than three recent testi-
monials, should reach the Principal (from whom
further particulars may be obtained) on or before
Saturday, July 9, 1927.

The successful candidate will be required to pass
a Medical Examination by the Authority's Medical
Examiner for Teachers at Cardiff before commencing
duties, and to contribute under the Teachers'
(Superannuation) Act, 1925.

JOHN J. JACKSON,
Director of Education.

City Hall, Cardiff.

ASSISTANT SURVEYOR required to
prepare Estimates and Bills of Quantities for
Civil Engineering and Architectural works; to
measure works executed; to check contractors'
accounts; and to perform any other quantity sur-
veying duties which may be necessary.

It is desirable that candidates should be Pro-
fessional Associates of the Surveyors' Institution,
Quantity Sub-Division.

The normal age limits are 21 to 30 years, but
consideration will be given to applicants who are
over 30 years.

Preference will be given to an ex-service man.
Salary £170 per annum, plus Civil Service
Bonus, or approximately £272 per annum; the
bonus is subject to periodical adjustment according
to the cost of living figures.

Apply, giving age, qualifications, experience, to
Civil Engineer-in-Chief, Admiralty, S.W.1.

THE LONDON ASSOCIATION OF
BUILDERS' FOREMEN AND CLERKS OF
WORKS, OLD BAILEY, E.C.4.

Experienced Foremen and Clerks of Works can
be obtained by applying to the Secretary, Mr. G. H.
WHITE, 77 Stanley Road, Bowes Park, N.11.

This Association (many of whose members are
ex-Service men) provides against Unemployment
and Death of its members, and Pensions for its
aged members or their widows.

The Association is affiliated to the National
Federations of Clerks of Works and Builders' Fore-
men's Associations of Great Britain and Ireland,
and invites eligible men to join and help to main-
tain the status and promote the interest of Build-
ing Trade Foremen and Clerks of Works.

SITUATIONS WANTED.

Booths' Steelwork

AHMADIYYAH MOSQUE, SOUTHFIELDS.

The exterior and the interior of this mosque conform strictly to traditional Moslem style in every detail, but the framing is Booths' steel. Booths can do anything with steel and can work to the most exacting limits.

From the moment the customer says "GO!" work never stops until the job is complete and ready for handing over. Particulars of many large and important undertakings for responsible concerns and well-known architects will be sent on request.

BOOTH'S FIREPROOF DOORS

Fireproof Doors are industry's surest safeguard against loss by fire. Each room can be turned into a fireproof compartment by fitting Booths' Doors, and any outbreak of fire can be localised and controlled by closing them. Booths' Doors already fitted in various parts of the world guard property worth over £123,000,000. Full particulars will be sent on request.
